Ottawa, Ont.—Carelton County Council is endeavoring to have the Dominion Government take over 25 miles of roads leading into Ottawa, including the following: Richmond, Montreal, Russel, Metcalfe and Bowesville roads, Ottawa-Prescott highway, Pembroke-Ottawa highway, and the Kingston-Ottawa highway.

Owen Sound, Ont.—Suburban Area Commission plans to repair St. Vincent road and construct the North Gravel road further westward this year. Address C. H. Thompson.

Peterboro, Ont.—Concrete paving is to be laid on the principal street this spring. City Engineer, R. H. Parsons.

Peterboro, Ont.—John McVicar, district engineer of municipal roads under the Department of Highways, has authorized the local suburban area commission to widen to the prescribed width of 66 ft. any roadways that are now less than that width.

Quebec, Province of.—Iron bridges costing a total sum of \$370,000, are under construction at the following places by the Department of Public Works: East Angus, Drummondville, St. Stanislas and St. Alexis. A total sum of \$600,000 has been voted by the Legislature for the building of bridges at Perrot Island.

Sandwich, Ont.—S. P. West, of Sandwich, was awarded contract at \$11,986.50 for paving Tournier and Baby Streets, and for paving Chippewa St. for \$20,351.62; contract for paving Partington Ave. was awarded to Pettypiece's, Ltd., of Amherstburg, at \$15,447.20; and for laying sidewalks on several streets to L. J. Ryan, of Windsor, for \$3,965.68.

Sherbrooke, Que.—The following streets will be paved next summer: Alexander, between Aberdeen and King St. West; Belvidere, between Frontenac and Drummond Streets; Bowen, between King St. East and Council St.; Brooks, between Aberdeen and Ball Streets; Frontenac, between Marquette and Belvidere Streets; King West, between

Belvidere St. and the city limits; Montreal, between Duferin St. and Queen St. City Engineer, Thomas Tremblay.

Stratford, Ont.—Tenders will be received until 12 o'clock noon, Saturday, April 8, by A. B. Manson, city engineer, for the construction of approximately 32,000 sq. yds. of concrete base for pavement and approximately 22,000 ft. of combined concrete curb and gutter.

Terrebonne, Que.—Provincial Department of Public Works will construct a bridge across the Thousand Island River at Montee Filion, provided the municipalities concerned are willing to pay 50% of the cost. Minister of Public Works, Hon. A. Galipeault.

Toronto, Ont.—Toronto and York Roads Commission will spend \$450,000 on county roads this year.

Toronto, Ont.—Works committee decided to have a 46-ft. pavement laid on Parliament St., from Queen to Wellesley St., at a cost of \$153,413.

Toronto, Ont.—Board of Control awarded contract to the Warren Bituminous Paving Co. of Ontario, Ltd., Toronto, for laying a bitulithic pavement on Coleman Ave., at a cost of \$27,095.

Toronto, Ont.—North Toronto Ratepayers' Association appointed a committee consisting of A. O. Thorne, W. E. Ellis and J. Schillinger to take up the matter of having Avenue road widened to 86 ft.

Toronto, Ont.—City Council is considering the question of proceeding at once with the paving of at least one side of Yonge St., which will require the Metropolitan Railway to move its tracks to the centre of the street.

Toronto, Ont.—Works Commissioner Harris informed the civic works committee that the widening of Bloor St., from Lansdowne Ave. to Dundas St., to a width of 86 ft., would cost \$387,000. The officials recommended that the plan be adopted.

Toronto, Ont.—Works Commissioner Harris again recommended to City Council the widening of Bloor St. to a width of 86 ft., from Sherbourne St. to Spadina Ave., and also approved of widening the street from Lansdowne Ave. to Dundas St. Total cost, \$1,878,000.

Toronto, Ont.—City Council intends to construct the following: Asphalt pavements on Fairford Ave., Maughan Crescent and Washaw Ave., at a total cost of \$77,102; concrete pavement on St. Clair Ave., \$35,348; concrete curbs, Fairford Ave., Hemlock Ave. and Maughan Crescent, \$3,366; and concrete sidewalk on Raglan Ave., \$614.

Toronto, Ont.—Toronto & York Roads Commission have awarded contracts for waterbound macadam roads to E. S. Dagg, of Woodbridge; for bituminous macadam roads to the E. A. Jupp Construction Co., Ltd., of Toronto; and for bituminous concrete on concrete to the Constructing & Paving Co., of Toronto. Engineer E. A. James, 57 Adelaide St. East.

Toronto, Ont.—That it would cost \$3,000,000 for the city to build a subway under Yonge St. for street railway tracks, from the lower level opposite Ramsden Park to the C.P.R. subway, south side, and from the C.P.R. subway, north side, to the old belt line railway, is the opinion given by Works Commissioner Harris in a report to the civic works committee.

Toronto, Ont.—Works Commissioner Harris submitted to the Works Committee a report as to the cost of constructing a subway on Yonge St., from Ramsden Park to Mount Pleasant Cemetery. He estimates it would cost approximately \$3,000,000, whereas Ald. Burgess, who suggested it, figured on \$500,000. A detailed examination of the scheme will cost \$25,000. The matter was laid over by the committee for another week.

Toronto, Ont.—Works Committee approved Works Commissioner Harris' list of local improvements to be undertaken this year under the \$3,000,000 limit ordered by the City Council. The list submitted, however, totals \$3,771,452, and include the following large items: Dundas St. extension, \$460,000; Yonge St. pavement, \$689,916; Teraulay St. pavement, College to Bloor, \$240,896; Sunnyside sewers, \$301,000; Lake Shore paving \$200,671.

Toronto, Ont.—Toronto has been asked by the Provincial Department of Highways to assume the liability for 20% of a \$5,000,000 road and bridge building program which will provide adequate highway entrances into the city from the north, east and west. Whether or not the work will be undertaken this year depends on the attitude of the City Council. The program includes a high level bridge over the Humber at Bloor St., another over the Don on Yonge St., and for a subway under the G.T.R. tracks on an easterly extension of the Danforth to the Kingston Road. Hon. F. C. Biggs stated that the Government is ready to let tenders for immediate construction, provided the city would pay 1/5 of the cost.

Vancouver, B.C.—At an expenditure of approximately \$200,000, the Canadian Pacific Railway Co. has taken steps to immediately replace the bridge across the Coquitlam river with a permanent steel and masonry structure. W. D. Grant, 739 Granville St., was the successful tenderer at \$74,000 for the foundation piers and abutments, and the contract for the supply, fabrication and erection of the double-track, through-truss steel span was awarded to the Canadian Bridge Co., Ltd., of Walkerville, Ont. This contract is said to be in excess of \$100,000 for approximately 700 tons of steel plates and heavy girders required in the 200-ft. span.

Victoria, B.C.—Hon. Dr. W. H. Sutherland, minister of public works, plans to have the Ymir Road completed.

Victoria, B.C.—A more aggressive road paving and improvement scheme for the section of the southern part of the Island including Metchosin, Sooke, Happy Valley and Luxton districts, together with more efficient methods of maintenance of the side roads communicating with the main arteries, was urged by a large and representative delegation which waited upon Hon. W. H. Sutherland, minister of public works, recently.

West Hill, Ont.—Construction of the Provincial high-level bridge on the Kingston road here is scheduled to start immediately.

Woodstock, Ont.—G.T.R. have decided to erect a foot-bridge over the Bay St. bridge.

Woodstock, Ont.—Oxford County Council estimates \$160,000 as the amount of money required for construction and maintenance of county roads for 1922, half of which will be for construction and half for repairs. Road Superintendent, William Forbes, Woodstock.

York Tp., Ont.—Contract for grading Goyder Ave. has been let to D. Mackay.

York Tp., Ont.—Township Council decided to widen various roads to 66 ft. Engineer, Frank Barber, Toronto.

York Tp., Ont.—Tenders will be received by Frank Barber, Township Engineer, Toronto, until 10 a.m., Monday, April 17, for the construction of six reinforced concrete culverts. (See official adv.).

WATER, SEWAGE AND REFUSE

Birch Cliff, Ont.—Scarboro Township Council will consider the placing of street lights in the Birch Cliff Heights and Kitchener Park districts, and also at Kennedy road G.T.R. crossing. Clerk, W. D. Annis, Scarboro.

Hamilton, Ont.—Controller Jutten will urge the Board of Control to have the tenders received for the proposed storm overflow sewer returned, and new tenders for the construction of the sewer by means of an open cut instead of the tunnelling method, upon which the present prices are based, called for.

Hamilton, Ont.—Tenders will be received by S. H. Kent, city clerk, addressed to George C. Copley (Mayor), chairman, Board of Control, City Hall, until 5 o'clock p.m., Monday, April 16, for the construction of section No. 3, Western storm overflow sewer. Specifications may be obtained at office of E. R. Gray, City Engineer.

Kitchener, Ont.—City Council instructed City Engineer S. Shupe to prepare plans for the West Ward storm drain.

Kitchener, Ont.—Contract for pump house and pump well for water supply has been awarded by City Council to B. G. Mitchell & Co., Kitchener. The tenders ran from \$15,000 to \$22,000. The following also submitted bids: Dunker Bros., Kitchener; Canadian Engineering & Contracting Co., Hamilton; Taylor Construction Co., Hamilton; H. H. Fernald, Kitchener; and Gilbert S. Wright, Toronto.

Montreal, Que.—For the necessary work in connection with putting into operation at the end of the current year the completed aqueduct, including the new pumping station, the executive committee of the City Council submitted a report to the Council recommending the voting of \$1,250,000.

Montreal, Que.—Considerable sewer construction work is about to be let by contract by the executive committee of the City Council. The lowest tenders received require an outlay of about \$90,000. With one exception, for a small job, the contracting firm of Ovila Filion & Frere submitted the lowest bids.

Pointe au Pic, Que.—Plans of proposed improvements to the water works system have been deposited with the Public Service Commission, Quebec, by A. Lariviere, engineer of the commission.

Quebec, Province of—Legislature passed a bill authorizing the Quebec Streams Commission to construct storage dams or other necessary works in Lakes Ouareau, Archambault and Blanc and in the river Ouareau near St. Agathe, for the purpose of storing their waters and of regulating their flow for the better utilization of the waterpowers to be obtained. The work is to be done by contract. Estimated cost, \$250,000.

Riverside, Ont.—Council instructed the town engineer to make reports on water mains and sidewalks for Menard subdivision and water mains on Riverside Drive. Also water mains on property from the Eau Claire water works to Little River and to Intersection road.

St. John, N.B.—The construction of a trunk sewer to take care of the outfall of service sewers on Lansdowne and Dufferin Avenues, and provide outfall for service sewers when installed on Metcalf St. extension and other areas in that vicinity, is projected.

Toronto, Ont.—Tenders will be received, addressed to C. Alfred Maguire (Mayor), Chairman, Board of Control, City Hall, until noon, Tuesday, April 11, for the laying and jointing of 6-in. water pipes in Nursewood Road. Specifications may be obtained at the office of the Water Main Extension Section, Department of Public Works, Room 320, City Hall. Also for the construction of a sewer in Strathmore Boulevard, from Woodington Ave. to Glehemount Ave. Specifications may be seen at the Works Department, Room 6, City Hall.

Toronto, Ont.—City Council intends to construct a sewer in Small St., at a cost of \$1,770.

Toronto, Ont.—Contracts for the laying and jointing of water pipes in Melrose Ave., Small St., Willard Ave., Woodbine Ave. and Ardagh St., have been let to Ruscica Bros. for a total of \$1,248.76.

Vernon, Ont.—E. A. James, consulting engineer, Toronto, has been engaged to prepare plans for a complete water works system for the village. The system will be of the gravity type and will be installed this year.

Winnipeg, Man.—The Public Utilities Commission decided on \$100,000 as the amount to be expended on sewer construction this year.

Woodstock, Ont.—City Council will be asked to submit a by-law at the next municipal election to authorize the raising of \$38,500 for an inclinator.

LIGHT, HEAT AND POWER

London, Ont.—Work in connection with the Hydro power line for London Township is expected to commence in a few weeks.

Victoria, B.C.—City Council awarded contracts for electrical supplies to the Canadian General Electric Co. amounting to \$4,100, and to Hawkins & Hayward, \$2,360.

Warkworth, Ont.—Village lighting system will likely be changed to a Hydro system.

Winnipeg, Man.—Contract has been awarded to the Winnipeg office of the Northern Electric Co. by the Manitoba Telephone System for Strowger automatic telephone equipment necessary to convert the Fort Rouge exchange to automatic service, the price being \$423,254.

RAILWAYS

Edmonton, Alta.—Edmonton, Dunvegan & B. C. Railway will be extended this year fifteen miles west from Grande Prairie City, present terminus, to a point near Lake Saskatoon, the necessary bill having been put through the Provincial Legislature.

Edmonton, Alta.—Extensions to three of Alberta's northern railways to the extent of 39.5 miles will be made this year, at a cost of \$1,006,000 for actual construction, and a further sum of \$514,456 will be devoted to maintenance, upkeep and equipment, according to an announcement at a recent session of the Legislature. The lines to be extended are the Lacombe and Northwestern Railway, 11.5 miles; Central Canada, 13 miles; and the Edmonton, Dunvegan and British Columbia, 15 miles.

Ford City, Ont.—T. U. Fairlie, railway engineer for the Hydro-Electric Power Commission of Ontario, estimates the cost to Ford City of moving the tracks from the side of Ottawa St. to the middle of the thoroughfare at \$19,040.

London, Ont.—G.T.R. will proceed at an early date with the laying of new steel between London and Sarnia.

Montreal, Que.—President E. W. Beatty of the C.P.R. announces that the directors of the company have authorized expenditures during the present year amounting to \$10,622,137, including \$1,021,700 for replacement and enlargement of permanent structures, \$1,008,200 for additional stations, sheds, etc.; \$1,500,700 for replacement of tracks with heavier sections, \$1,500,000 for a new pier at Vancouver and \$1,454,500 for extensions to Chateau Frontenac, Quebec.

Ottawa, Ont.—A deputation representing Niagara municipalities waited upon the Minister of Railways, Hon. W. C. Kennedy, with a request that the Government should make improvements to the Niagara, St. Catharines and Toronto Electric Railway, which is part of the National System.

St. Thomas, Ont.—Wabash Railway Co. has definitely decided to erect new locomotive repair shops on the local Canadian division. Estimated cost, \$500,000.

Windsor, Ont.—Tenders for the erection of new freight sheds and yards here have been called for by the Canadian Pacific Railway Co. The company will spend approximately \$250,000 on improvements in Windsor.

Winnipeg, Man.—Contract for the relaying of pipe lines at various points in the Manitoba district of the Canadian Pacific Railway has been awarded to the Hurst Engineering & Construction Co., Scott Block, Winnipeg.

Yorkton, Sask.—Local Board of Trade is agitating for the early completion of the 60-mile railway gap between Sturgis and Hudson Bay Junction.

FACTORIES AND LARGE BUILDINGS

Amherst, N.S.—Fire gutted the Lusby-McDonald Block on Crescent Ave., causing a loss of approximately \$30,000.

Annapolis Royal, N.S.—Contract for erection of Memorial Town Hall has been let to Allen & McCaw, of St. John, N.B.

Brantford, Ont.—Board of Education asked the City Council to extend the by-law providing for the construction of a school on Terrace Hill for two years, and in the meantime to pass a by-law providing for the raising of approximately \$80,000 for an addition of 8 rooms to the Collegiate Institute.

Campbellford, Ont.—The erection of a High School is projected. Estimated cost, \$35,000.

Carleton Place, Ont.—The Board of Education is asking the Town Council to submit a by-law for \$110,000, to erect a new High School and convert the former building into a new public school.

Chapleau, Ont.—Contract for erection of school building awarded to Angus & Taylor, Ltd., North Bay, at \$74,666.

Colborne, Ont.—By-law passed authorizing Town Council to provide \$30,000 for erection of High School.

Delhi, Ont.—Village Council contemplates extension of school accommodation, and a by-law to authorize the raising of \$15,000 will shortly be submitted to the ratepayers.

Delia, Alta.—Tenders for the erection of a schoolhouse for Newport School District No. 3,233 will be received until April 20 by John O. McKee, Sec.-Treas., Delia, Alta.

Edmonton, Alta.—Permit issued to Crossland Printing & Publishing Co. for the construction of a printing office near the corner of 102nd Ave. Contractor, H. P. Alexander.

Ford City, Ont.—The erection of an Anglican Church in Englewood Park is projected.

Fort Frances, Ont.—High School Board has authorized its architect to submit plans for a high school building to cost \$60,000.

Fort William, Ont.—Tenders will be received until 12 o'clock noon, Monday, April 17, for the erection of an addition to Ogden Public School. Architect, Harry M. Scott, 200 Cuthbertson Bldg.

Fredericton, N.B.—Tenders for Canoe Factory will be received until 12 o'clock noon, Saturday, April 8. Plans and specifications may be seen at the store of R. Chestnut & Sons, Ltd., Queen St., and any further information may be obtained from W. E. Minue, architect, 220 Aberdeen St.

Galt, Ont.—Plans are being prepared for an addition to the Collegiate Institute.

Galt, Ont.—Work has started on the construction of an addition to the plant of the Riverside Silk Mills.

Galt, Ont.—Contract for construction of addition to factory of the Riverside Silk Mills awarded to Charles McInnes, of Galt.

Galt, Ont.—City Council and Board of Trade endorsed an industrial proposition to establish a tire manufacturing plant here, 200 by 100 ft.

Galt, Ont.—Trustee Board of the Methodist Church decided to erect a new Sunday School building this season, at an approximate cost of \$20,000.

Hamilton, Ont.—Time for receiving tenders for the building of a Masonic Temple, addressed to W. M. Logan, 10 Gore St., Secretary of Towers, Ltd., has been extended to 12 o'clock noon, April 8.

Hastings, Ont.—A free site for the erection of a school has been offered to the town by John Coughlan.

Kentville, N.S.—Erection of an arena is projected.

Kingston, Ont.—The curling rink, the property of Queen's University, was destroyed by fire.

Kitchener, Ont.—Excavation work has started for the new \$30,000 parish hall of St. Peter's Lutheran Church.

London, Ont.—Board of Education plans erection of a four-room addition to Ealing School. Estimated cost, \$45,000.

London, Ont.—A movement is on foot among the various civic organizations to have a new G.T.R. station built here this year.

London, Ont.—Board of Governors of Western University announced that work on the new buildings will be commenced on April 15.

Mimico, Ont.—The sum of \$29,656 will be spent on public schools this year in addition to the erection of a school on Church St. An agitation has begun for the erection of a High School under a joint board of New Toronto and Mimico trustees.

Mimico, Ont.—Separate and bulk tenders will be received until noon, April 8, for all trades required in the construction of a six-roomed school. Plans and specifications may be seen at the office of the architect, Harold R. Watson, 907 Excelsior Life Bldg., Toronto, or at the Mimico Public School Building.

Montreal, Que.—A proposal to erect a public bath on the west side of Amherst street in front of the St. James Market is being made to the executive committee of the city by Ald. Genereux.

Mount Dennis, Ont.—Fire destroyed the plant of the Canadian Nitro Products Co. Loss, \$75,000.

Norwood, Ont.—A Carnegie library is to be erected here.

Oshawa, Ont.—Oshawa Golf Club plan erection of clubhouse at cost of \$10,000.

Oshawa, Ont.—Board of Education decided to spend \$220,000 during the coming summer on school improvements, including the erection of a 12-room school and an S-room school.

Ottawa, Ont.—Fire damaged the building occupied by the Ottawa Typewriter Co., 191 Queen St., to the extent of \$60,000. Owner, H. C. Brennan.

Ottawa, Ont.—Tenders will be called shortly for the re-modeling of St. Matthew's Church. Estimated cost, \$30,000. Architects, Millson & Burgess.

Ottawa, Ont.—Contract for addition to University of Ottawa has been awarded to John Quinlan & Co., of Montreal. Their tender was \$114,000, the lowest of ten submitted.

Ottawa, Ont.—Collegiate Institute Board awarded the following contracts in connection with the erection of Percy St. Collegiate Institute: Plumbing and heating, W. G. Edge, Ltd., \$63,938; lathing and plastering, E. J. Currie, Toronto, \$34,288; marble and tile work, A. K. Mills, \$29,388; roofing, J. D. Sanderson, \$2,619; tinsmithing and sheet metal work, W. G. Edge, Ltd., \$32,900; electric wiring, Marchand Electric Co., \$15,730; painting and glazing, J. B. Dufour, \$21,365.

Peace River, Alta.—Peace River Creamery Co. will build a plant.

Peterborough, Ont.—Board of Education considering erection of addition to Collegiate Institute. Approximate cost, \$150,000.

Port Arthur, Ont.—Following contracts have been awarded for erection of extension to plant of the Provincial Paper Mills, Ltd.: Machinery, Port Arthur Shipbuilding Co., Port Arthur; structural steel, Dominion Bridge Co., Montreal; and for the building to J. C. Trimble, of Toronto. The extension was designed by H. S. Taylor, Ltd., Montreal. Total estimated cost, \$1,500,000.

Preston, Ont.—Methodist Church board plans erection of Sunday School building at a cost of \$20,000.

Preston, Ont.—Contract for erection of Sunday School building for Methodist Church awarded to Albert Coher, of Hespeler. Estimated cost, \$20,000.

Prince Rupert, B.C.—By-law providing for the establishment of a municipal library by the City Council was passed by the ratepayers. City Clerk, E. A. Woods.

Quebec, Que.—Convent of Port Alfred, Chicoutimi County, was destroyed by fire. Loss, \$50,000.

Quebec, Que.—Knights of Columbus plan to construct a new wing to the present building on Grande Allee and to install a swimming pool and gymnasium. Estimated cost, \$60,000.

Regina, Sask.—The Separate School Board is raising \$12,000 for the erection of a school in the north end of the city.

Renfrew, Ont.—Work will start shortly on the erection of a new Collegiate Institute.

Riverside, Ont.—Town Council authorized H. A. Lothian, architect, to prepare plans and specifications for the proposed \$15,000 Town Hall.

St. Anne de Beaupre, Que.—St. Anne's Church, recently destroyed by fire, will be rebuilt.

St. Catharines, Ont.—Fire damaged the plant of the Packard Electric Co. to the extent of \$20,000.

St. John, N.B.—Excavation has started on the site of a new Sunday School building to be erected in connection with the Main Street Baptist Church.

St. John, N.B.—Plans are under way for the erection of a home for the I.O.O.F. for the Maritime Provinces and

Newfoundland. Address C. L. Woods, Truro, N.S., Grand Master.

St. Lambert, Que.—A public assembly hall combined with a fire station, a large annex to the principal school and two new school buildings are to be built by the City Council and School Commissioners at an expenditure of over a quarter of a million dollars. The hall, fire station and new school annex will be built this year, the former at a cost of \$140,000.

St. Mary's, Ont.—W. G. Murray architect, London, is preparing plans for the proposed extensions to the Collegiate Institute.

St. Thomas, Ont.—Erection of a Y.W.C.A. building is projected.

Sandwich, Ont.—Tenders for the construction of Essex County tuberculosis sanatorium will be received until April 10.

Sarnia, Ont.—Citizens decided to form a company capitalized at \$100,000 for the erection of a skating rink costing \$40,000, with an artificial ice refrigerating plant at an additional expenditure of \$30,000.

Stratford, Ont.—Mr. Dodds, of this city, plans the erection of a plant for the manufacture of flour milling machinery and other equipment.

Stratford, Ont.—Tenders will be received by J. M. Riddell, Secretary-Treasurer, Board of Education, until 5 p.m., Monday, April 10, for all trades in connection with the erection of a 4-roomed school. Plans and specifications may be obtained from H. G. Holman, architect, Suite 2, Beacon Building, Stratford.

Sudbury, Ont.—Canada Creosoting Co. plans to erect an addition to its plant. The company may also construct a million dollar plant at Capreol this summer.

Toronto, Ont.—Fire destroyed the warehouse of the Toronto Storage Co., 37 River St. Loss, \$7,500.

Toronto, Ont.—Ratepayers of Lakeview district have been asked to authorize the erection of another school.

Toronto, Ont.—Riverdale ratepayers are urging action by the City Council in establishing an east end library.

Toronto, Ont.—Officials of Greenwood Ave. Presbyterian Church have secured a loan of \$17,000 for the erection of a new building.

Toronto, Ont.—Board of Education is considering the purchase of a site and the erection of an 8-roomed school somewhere south of College St.

Toronto, Ont.—Board of Education will have plans and specifications prepared and call for tenders for a 4-room addition to Manning Ave. School.

Toronto, Ont.—Drawings and specifications are nearly completed for Jarvis Street Collegiate, and tenders will be called this week by the Board of Education.

Toronto, Ont.—Beverly Street Baptist Church members will launch a campaign to raise \$35,000 for extensions to the Sunday School accommodation. Pastor, Rev. E. O. Forde.

Toronto, Ont.—Architect W. H. Moore has been instructed to proceed with the building of the new \$60,000 eight-room Separate School in Moore Park, and four rooms will be built immediately.

Toronto, Ont.—Applications for loans for the erection of churches and manse totalling \$350,000, have been made to the Board of Home Missions and Social Service of the Presbyterian Church in Canada.

Toronto, Ont.—Mayor McGuire announced that he would shortly introduce a motion calling for approval of the construction of an athletic stadium near the Exhibition Grounds. Estimated cost, \$150,000.

Toronto, Ont.—Sketch plans for an additional six rooms at Humberstone Collegiate were placed before the property committee of the Board of Education. The sum of \$90,000 has been appropriated for this work.

Toronto, Ont.—Separate and bulk tenders will be received until noon, April 8, by J. M. Cowan, architect, 3 Carlton St., Toronto, for all trades required in the erection of St. James School, Jane St., for the trustees of the Toronto Separate School Board.

A Weekly Paper for Civil Engineers and Contractors

Smoky Falls Development on the Sturgeon River

Hydro-Electric Power Plant for Spanish River Pulp and Paper Mills at Smoky Falls, Ont.—Present Installation of 5,200 h.p. in Two Units With Provision for Two More Units—Details of Turbines and Generators

By C. C. IRVINE

President, Spanish River Pulp & Paper Mills, Ltd.

S TURGEON River is the main tributary of the French River system and flows into Lake Nipissing near the western end of the main body of that lake. The drainage basin is slightly less than 3,000 square miles in area, and is largely covered with fairly dense forest growth. Along the lower thirty miles of the river there is an old farming community which cultivates a narrow stretch along the two banks of the river.

The drainage basin is bounded on the North and East by the Montreal River and on the West by the Wah-nipitae River. There are many lakes in the drainage basin which offer good opportunities for the storage of water. The river descends rapidly throughout the greater part of its course and there are numerous rapids and falls.

Smoky Falls has a natural drop of about 28 ft., and occurs about 14 miles by river above Lake Nipissing. At this point there is an island which splits the river in two, offering a favorable site for a power development. It is here that the hydro-electric plant of the Spanish River Pulp & Paper Mills, Ltd., is built.

A gauging station was established by the Ontario Hydro-Electric Power Commission two miles above Smoky Falls in 1915, and continuous flow records up to the date of construction (1920) were available for study. The average, minimum and maximum monthly flows for this period are shown in table (1).

Surveys were started in January 1920 to determine the

maximum elevation to which the head water could be raised without causing damage to the farms along the river. All elevations are referred to the local bench mark. The river has a natural rise and fall at the gauging station of eight ft., from 102 to 110 depending on the stage of the river. At the higher stage considerable damage was done to some of the low lying farm land and it was finally decided that elevation 106 should be the normal head water elevation, which would give a head of from 33 to 36 ft. During the same winter investigations were carried out at the dam site, which showed that the foundations for both power house and dam would be on solid rock.

Construction work was begun in May, 1920. In order to facilitate handling material, two miles of spur track were built from Smoky Falls Station on the Canadian Northern Railway to the power house site. The right of way for this spur track was purchased and was later used for the transmission line and wagon road.

CROSS SECTION OF POWER HOUSE,
SMOKY FALLS, ONT.

Description of Development

The power house is situated along the river bed of the south channel and is founded on solid rock. It is 114 ft. 4 in. long by 27 ft. 2 in. wide inside, with a transformer and switching bay 13 ft. 6 in. wide running the whole length of the power house. The sub-structure and head wall are reinforced concrete, and the super-structure is of steel and brick with a poured gypsum roof. The intakes of the scroll casings are each 22 ft. by 11 ft., with a central stream-lined

pler to carry the trash rack supports. Trash racks are 23 ft. long and made up of 4 in. by 5 16 in. bars 2 1/2 in. centre to centre. Moody patent spreading draft tubes are used. The head gates for the scroll casings, two for each unit, are of reinforced concrete cast in place. To relieve the pressure when opening under full head, the upper 2 ft. of each gate is arranged to lift 24 in. before the lower portion moves, thus allowing the scroll casing to fill and balancing the pres-

sure on each side of the gate. In the south channel a log chute with reinforced concrete drop gate is provided for log driving.

Details of Equipment

Two Tainter gates in the south channel and four in the north channel are provided to take care of flood waters.

POWER HOUSE—LOOKING UP STREAM FROM
TAILRACE

Each gate is 14 ft. by 20 ft. with sills at elevation 92. In addition, 80 ft. of spillway with crest at elevation 103, and flash boards 3 ft. deep are provided. The total discharge capacity of all gates and spillway with head water at elevation 109, is 30,000 second-feet; this allows 11 c.f.s. per square mile of drainage area, and as the latter is partially controlled by storage dams, and in view of the existing flow records of the past eight years this is considered ample discharge capacity.

The water wheels were built by the Wm. Cramp & Sons, Ship & Engine Building Co., I. P. Morris Department, Philadelphia, Pa. They are of the single runner vertical type, and are designed to give 2600 h.p. under a 33-ft. head at a speed of 138.3 r.p.m., the efficiency under these conditions being 89%; they are provided with hand-operated breaking mechanism. Woodward oil pressure governors are installed on each unit, and are controlled electrically from the switchboard.

INTERIOR OF POWER HOUSE—SMOKY FALLS

The generators were built by the Canadian Westinghouse Co., and are each 2125 k.v.a., 50 deg. Fah. rise, 3 phase, 2300 volt 60 cycle, 138 r.p.m., with Kingsbury thrust bearing and direct connected exciters; each exciter being capable of exciting two units. For transmission to the

Company's mill at Sturgeon Falls the voltage is stepped up to 22,000 volts. The transforming equipment consists of three 3000 k.v.a., single phase, Westinghouse transformers, oil insulated and water cooled. The cooling water is drawn from any one of the four scroll cases and forced through the cooling coils by a duplicate set of direct connected motor driven pumps. Oil switches are installed for each generator, and automatic oil circuit breakers on both the low tension and high tension side of the transformers, the latter being necessary as there are two outgoing lines. The switchboard consists of seven slate panels and swinging bracket provided with the usual meters. Provision is made for the installation of a Tirrell regulator at a later date.

Auxiliary Apparatus

A motor generator set with sufficient capacity to excite all four units is provided to insure excitation, and there are station transformers for power, lighting and heating. As the station runs on very light load on Sundays it is essential to heat the power house during the winter months when temperatures as low as 30 and 40 degrees below zero are encountered. Electric hoists are provided on both dams for the operation of Tainter and head gates and log chute gate. It is proposed ultimately to install four units but there are only two at the present time.

GATE DAM—NORTH CHANNEL LOOKING UP STREAM
NORTH BANK OF RIVER

TABLE NO. 1

Flow of Sturgeon River at Smoky Falls
November 1914 - October 1921

	Monthly Average	Minimum Monthly Average	Minimum Monthly Average
	c.f.s.	c.f.s.	c.f.s.
November	2780	1790	4290
December	2440	1620	3570

September	2010	1080	3010
October	2400	1040	3450

Transmission Line

The power is transmitted eight miles to the Company's mill at Sturgeon Falls and is stepped down to 2,200 volts for distribution. The transmission line consists of a wood pole two-circuit line carried on pin type insulators. Poles are western red cedar with creosoted butts and are spaced 135 ft. apart. The conductors are of 2/0 aluminum cable steel reinforced. The telephone line is carried on the same poles and connects the mill and the power house. The transmission line is protected at both ends by type "AK" electro-

lytic lighting arresters. The tanks are placed inside the building and the horn gaps outdoors. The first two units have been in operation since November, 1921, and the plant is giving every satisfaction.

James O. Heyworth, Chicago, was the contractor and engineer for general construction while the spur track and transmission line were built by Messrs. Lang & Ross, of Sault Ste. Marie, and the waterwheels and generators were purchased by the Management Engineering & Development Co., of Dayton, Ohio.

Typical cross sections of the power house and several views of the development are shown.

MUSSENS LTD. OUT OF LIQUIDATION

Firm Passed Into Receiver's Hands Seven Years Ago But Now Pays Last Cent of Debts Then on Its Books

ONE hundred cents on the dollar has been paid to the creditors of Mussen's Ltd., who entered voluntary liquidation in March 1915 upon petition of W. H. C. Mussen, president of the firm. Various payments on account have been made to creditors at different times during the past five years, and about a week ago cheques were forwarded paying the final dividend of 10% and completing the payment in full of all obligations that were on the books of the firm at the time of entering liquidation.

On account of the difficulty of making collections and of profitably disposing of the heavy stock then carried by his firm, Mr. Mussen was forced to apply for a receiver in 1915, but he announced at that time that his liabilities amounted to only \$300,000, with assets estimated at \$550,000. He declared that all creditors would be paid in full, although it would be impossible to realize on the stock and equipment until the depression of the early war period had passed.

Mr. Mussen then declared that the liquidation proceedings were not sought in order to reorganize the business, but for the protection of the creditors, and so that the assets could be preserved against sacrifice and every claim paid in full.

During the seven-year period in which the firm was in liquidation, it received the hearty support of nearly all the manufacturing firms represented before the war, and with one or two exceptions the same firms are still represented by Mussen's, Ltd., and other new lines of railway, municipal and contractors' machinery and supplies have been added. The firm has branches at Toronto, Winnipeg and Vancouver, and all department heads were retained throughout the period of liquidation, so the efficiency of the organization has not been impaired although it proved necessary to reduce the staff materially and to abandon the large show-rooms and warehouse on St. James St., Montreal, formerly occupied by the Company.

The firm of Mussen's, Ltd., was established by W. H. C. Mussen in 1901, and was organized as a joint stock company in 1906.

REID INCINERATOR CO. REORGANIZED

REORGANIZATION of the Reid Incinerator Co., Ltd., Toronto, has been announced, with A. H. Reid as president and manager and T. B. Reid as secretary-treasurer. Offices have been taken at 904 Bank of Hamilton Bldg., Toronto.

The Reid Incinerator Co. was organized a number of years ago by A. H. Reid, who is the designer of the incinerator which bears his name. T. B. Reid, who has just joined the company, recently resigned from the sales department of the Canadian General Electric Co., Ltd., Toronto, and formerly a director of the A. R. Williams Machinery Co., Toronto, and at one time was manager and secretary-treasurer of the latter firm's American company.

Approximately seventy installations of the Reid incinerator have been made in Canada, some installations in-

cluding as high as 39 separate incinerators. These include installations for military camps, hospitals, hotels, public institutions, golf clubs, factories, summer resorts and municipalities. The municipal installations are at Peterboro, Stratford, Sault Ste. Marie, New Toronto, Halleybury, Timmins and Bassano. The incinerators vary in size from the residential type to municipal installations of 50-tons daily capacity.

MONTREAL WATER SUPPLY INCREASED

MONTREAL Water Works was the subject of an address by C. J. DesBaillets, before the Montreal branch of the Engineering Institute of Canada, recently. Mr. DesBaillets, who is a member of the Montreal Water Board, spoke about the low level pumping station and described the alternate systems of water supply. He explained that the system to be used will provide for filtered and chlorinated water, and, in the event of this breaking down, of a chlorinated water supply, to come from the emergency intake which divides in two sections the big concrete intake pipe. The third alternative is a supply of water from the Lachine Canal, so devised that this water will be both filtered and chlorinated.

The speaker explained the change whereby electric pumps had replaced the old steam pumps with their large staz of men and heavy coal bill, and stated that in 1921 the saving had been \$370,000 through the change, based on an average of 72 million gallons per day. When the city would use an average rate of 100 million gallons per day, which would be the case in the near future, the saving of electrically-driven units over steam-driven units will be approximately \$510,000 per year. The operating staff instead of being 90 men, as in the time of the steam-driven pumping plants, is now reduced to seven men, which, he pointed out, adds to the continuity of service, a large factor of safety.

AMERICAN SOCIETY FOR TESTING MATERIALS

DURING the week of June 26, 1922, the Twenty-fifth Annual Meeting of the American Society for Testing Materials will be held at the Chalfonte-Haddon Hall, Atlantic City, N.J. The first session will be held on Tuesday morning, June 27, and the closing one either Friday evening or Saturday morning, July 1. The Committee on Papers has been working for some time on the program of the coming annual meeting and it is expected that a tentative program will be ready about the end of April. Due largely to the fact that 1921 was the year for triennial publication of the Book of Standards, consideration of standards predominated at the last annual meeting. The committee is therefore arranging the program this year to give greater prominence to technical papers and discussions, and to those features of committee reports not dealing with standards.

There will be a number of topics of live interest to materials engineers. Several of these will appear in committee reports; for others, papers are being solicited from members best qualified to discuss them. As much time as possible will be reserved for general discussion, which the committee believes will add greatly to the interest and value of the meeting. A few of the topics that it is expected to develop in this way are: Effect of Sulphur in Rivet Steel, Physical Properties and Tests of Steel Castings, Impact Testing of Materials, Fatigue of Materials, Specifications for Coal, Thermometry, Inspection of Concrete, and Specifications for Concrete and Reinforced Concrete.

Executive officers elected at a meeting of Queen's University Engineering Society were as follows: Honorary president, Prof. L. M. Arkley; president, L. C. Anderson; 1st vice-president, T. D. Johnston; 2nd vice-president, H. Hutchinson; treasurer, E. E. Bryndon; secretary, N. C. Sutherland; representatives, E. Holt, D. A. Henderson, J. E. Brookfield, H. H. Snyder.

EVOLUTION OF TRANSPORTATION*

Development of Transportation Methods by Land and Water
— Motor Buses and Trolley Buses — Electrification of
Railways — Motive Power for Branch Lines

By C. R. Young

Associate Professor of Structural Engineering,
University of Toronto

TRANSPORT in many countries has not progressed very far past the pack animal stage, such for example as in the mountainous districts of Asia and South America. The use of wheeled conveyances is a comparatively modern development in civilization, receiving its great impetus with the construction of permanent roads by the Romans. With such highways available, built although they were primarily for the purposes of war, the development of wheeled transport spread rapidly. The extravagance involved in roads of the Roman or related types, which were often from 2 to 3 ft. thick, precluded the construction of greater mileages in the early days of improved highways. Even with the modification of Tresaguet and Telford, who reduced the thickness, improved highway construction still remained comparatively expensive, and it was not until Macadam proved the soundness of his advanced conception of road building with broken stone that the modern improved highway extended rapidly.

Along with the development of stone surfaced roads there proceeded the idea of special trackway construction. Planking, resting either on wooden sleepers or embedded in the roadway surface, was used as early as 1630 by Beaumont. In some cases metal plates were nailed to the upper surface to decrease the frictional resistance. This was an interesting working out of the old Roman practice of laying two lines of cast stone trackways, which persisted even down to the first half of the nineteenth century when numbers of roads of this type were built in New York State. Cast iron plate ways were first built in England about 1733, and in 1776 John Curr built a cast iron tramway for the Duke of Norfolk's colliery near Sheffield which commanded much attention, and incidentally nearly cost Curr his life through the rioting of the populace who resented any improvements of this nature. While these trackway features were primarily a highway development, they have a vital bearing upon the introduction of steam railways.

Motor Vehicles

As the hardness and smoothness of roadways increased, the idea of mechanical propulsion of vehicles grew apace. Sir Isaac Newton had conceived a simple vehicle propelled by a jet of steam. Savery also suggested a steam propelled conveyance, but Watt curiously enough did not follow up the suggestion. A spectacular achievement, however, was made by Cugnot, who, in 1769, built, in Paris, a steam carriage which was able to carry four persons at two and one-half miles per hour. The smallness of the boiler prevented operation for more than fifteen minutes at a time, and, as one of Cugnot's steam carriages created a great disturbance through overturning at a street corner, it was locked up in the arsenal and nothing further came of it. George Stephenson, sound though he was on matters of locomotive development, scouted the idea of running steam propelled carriages on the highways unless these were provided with special trackways. Nevertheless, a very considerable interest persisted in the mechanical propulsion of highway vehicles, and we find, for example, in 1862, Christopher N. Spencer, inventor of the Spencer rifle, going to and from his work in a steam wagon invented and built by himself. The idea of mechanical transit on highways being established, it remained for the internal combustion engine to solve the problem completely. With it the automobile and motor

truck soon attained their present position of basic importance in highway transport.

Motor Buses

Success of the motor bus in England and elsewhere brought about the establishment of the Fifth Avenue line in New York in 1906 with results that have been entirely satisfactory. The electric railway debacle brought about by rising costs with fixed fares favored the further extension of motor bus traffic. It is said that from 1915 to 1920, ninety-one electric railways operating 5,330 miles, or more than one-fifth of the total electric railway mileage in the United States, went into receivership. In 1920 over 623 miles of electric railway service was suspended and of this 433 miles permanently abandoned. In 1921, 113 miles of service was suspended and 150 miles abandoned. The fact that a large investment must be carried for trackage, overhead construction, and power house equipment, amounting to from 60 to 75% of the total investment, places electric railways under a handicap as compared with motor buses, in one respect at least.

The use of buses is too familiar on this continent to require special comment. In Winnipeg they have been used for feeders to the street railway system since 1918 and in Toronto a number of them are now on trial for a similar purpose. Their value in linking up disconnected divisions of electric railways has been demonstrated both in Canada and the United States.

Trackless Trolleys

The essential lack of economy in power development involved in the use of motor buses, each with its individual engine, suggested the use of a bus deriving its power from overhead trolley wires fed from a central power station. The fact that trackway construction is not necessary for a bus so propelled gives it an advantage over the electric railway. Use of trackless trolleys in England and certain experimental work conducted in the United States caused the installation of vehicles of this type at Norfolk, Va., Richmond, Va., and Staten Island, N.Y., with results that appear to have been successful. The City of Toronto has bought four trackless trolleys of a type similar to those tried out in Detroit and will operate them experimentally for feeder service. Recently the Hydro-Electric Power Commission of Ontario has bought four of these vehicles and is operating them in Windsor, Ont.

Adoption of bus or trackless trolley transportation is of course a matter both of practicability and cost. It has yet to be demonstrated that these methods are thoroughly practicable in northern climates where excessive cold and heavy snowfall might interrupt traffic for a much longer period than with electric railway transport. A good deal of interest is being displayed in the outcome of the experimental operation of these vehicles in Toronto.

A recent study of the comparative costs made by the Public Utilities Commission of the State of Massachusetts gives the following approximate characteristic figures which include taxes and 3% interest on investment: Operating costs of electric car per car-mile, 48 cents; safety car per car-mile, 25 cents; motor bus per bus-mile, 24 cents; trolley bus per bus-mile, 21 cents. According to recent figures the cost of operating motor buses in Winnipeg per bus-mile ranges from 28.5 to 29.2 cents, whereas operating costs per car-mile under similar conditions runs from 32.8 to 36.7 cents. In the Massachusetts figures it should be noted that the capacity of the electric car was 52 whereas that of the other three types of vehicle is approximately 30. While no operating costs for buses in Toronto have been made public, it is understood that the cost so far per bus-mile is greater than the cost per car-mile.

Experience to date appears to show that in general for heavy traffic, motor buses and trolley buses cannot compete with the two-man electric car with its larger capacity. For light traffic and for feeder service these newer means of transport are of distinct value, being capable of operation

*From an address before the Hamilton Scientific Association, Hamilton, Ont.

at approximately the cost of a one-man car, but with greater flexibility.

Steam Railway Development

Early ideas of mechanical propulsion of vehicles shaped towards the perfection of the steam locomotive in the minds of William Symington, William Murdoch, Oliver Evans and Richard Trevithick. The latter, in 1804, put into operation perhaps the first real railway locomotive, running it around a model circular railway in London. He, however, like all his predecessors, was unable to generate steam fast enough to provide continuous operation. Blenkinsop, distrusting the frictional resistance of wheels on trackways, provided a toothed rail engaged by a spur wheel on the locomotive. Engines of this type were used in 1812 with success in the Middleton collieries, operating over a distance of $3\frac{1}{2}$ miles. Thirty coal wagons were hauled at the rate of $3\frac{1}{4}$ miles per hour with this locomotive.

Following the comparative success of Blackett with several engines at the Wylam colliery, George Stephenson, who could neither read nor write until he was 18 years of age, made a number of important improvements in the engines that had heretofore been used. He abandoned Blenkinsop's idea of a cogged railway and in order to generate more steam he turned the blast up the stack, thus greatly augmenting the draft. So successful was his Killingworth locomotive that he was appointed engineer for the Stockton and Darlington railway, a 12-mile coal line conceived of at first as a horse railway, or at most as a railway operated by stationary engines. The locomotive was still distrusted by all except a very few far-sighted men such as Stephenson. In spite of the most violent opposition the Stockton and Darlington railway was opened in 1825, and on this road the first railway coach known as "The Experiment" was operated by horses. The railway company did not itself at first operate vehicles, but let privileges to all those who were able to pay the necessary toll. The remarkable success of the undertaking, however, soon made it necessary for the company to assume operation as well as maintenance of way.

With the success of the Stockton and Darlington railway the line from Liverpool to Manchester, a distance of 30 miles was projected in 1821 and carried out by Stephenson within the following nine years. Even more violent opposition than was offered to the Stockton and Darlington railway was brought out in connection with the Liverpool and Manchester line, engineered, for the most part, by the canal interests who feared competition. Stephenson had the greatest difficulty in securing approval of the charter and in order that he might not be deemed a madman he had to confine his forecasts of speed to ten or twelve miles an hour, although he personally knew that twenty miles an hour was easily obtainable. An interesting feature in the construction of this railway was the famous Rainhill trials of locomotives in 1825, when Stephenson's Rocket, weighing only $4\frac{1}{4}$ tons, including boiler water, eclipsed all other competing locomotives. This little engine ran 29 miles an hour dragging a load of 13 tons after it and covered 35 miles per hour running light.

Following the success of Stephenson, violent speculation in railways arose in the early forties surpassing anything that has ever been seen in Canada. In 1845, Parliament granted powers to build 2,883 new miles of railway, estimated to cost £44,000,000. In 1846, 272 new hills were submitted for railways to a value of £389,000,000, and consent was given for the construction of 4,790 miles at a value of £120,000,000. Similar activity continued for some years after this. The magnitude of these promotions is apparent when it is remembered that there are now in Great Britain only 24,000 miles of railway.

Railways of America

In America railway activity might be said to have begun in earnest with the construction of the Carbondale railway in 1827 when sixteen miles of line were put into operation, partly by the use of horses and partly by stationary engines. The first locomotive in America, the "Stour-

bridge Lion," built in England, was put into operation on this line. In 1828 the Baltimore and Ohio railroad began to operate as a horse railroad, but shortly afterwards was transformed into one operated by steam. The same dispute as had been waged in England concerning motive power occurred on this continent with identical results. Interesting departures from European practice brought about by the topography and financial resources of the country were the heavier grades and sharper curves. Grades were attempted that would have dismayed Stephenson, and the sharp curves made it necessary to utilize the swivelling truck very early.

The first railway activity in Canada began in 1832 when a charter for fourteen miles of line between La Prairie and St. Johns, Que., was granted. This road which was projected to reach Lake Champlain was opened in 1836 and was horse operated on wooden rails. After a year, however, iron rails were substituted and steam locomotives put into use.

In 1852 the Grand Trunk Railway was projected between the Great Lakes and the Atlantic seaboard, and from then on railway construction progressed rapidly.

Motive Power

Remarkable development of the steam locomotive has taken place in the last thirty or forty years. Old "999" which drew the Empire State Express at an average of 64 miles per hour and a maximum speed of $112\frac{1}{2}$ miles per hour has been supplanted by a much heavier type of engine. With the prevailing axle loads it is now impracticable to make such speeds, but the heavier locomotives are able to haul far greater loads at a reasonably high speed than could ever have been attempted by a locomotive of the light construction of "999".

For heavy freight traffic on steep grades the modern Mallet articulated compound locomotive has proved to be a most valuable piece of equipment. The Virginian 2-10-10-2 locomotives of this type with a weight of 342 tons not including the tender are of 4,800 h.p. and are able to exert a tractive force of 147,200 pounds.

Railway Electrification

However efficient the modern steam locomotive may be as compared with its early prototypes, there is an essential lack of economy involved in providing a series of moving power houses for the handling of trains. The consumption of coal per horse power hour is from 6 to 7 lb., by reason of the impracticability of installing all the auxiliary equipment on locomotives that makes for the high economy of a central power house. Apart from this, the efficiency of a steam locomotive varies widely with its age and use, a modern superheated locomotive requiring about 50% more steam per horse power hour at full load than at half load. It must also burn coal while descending grades or when standing by, and when it is remembered that in Canada in 1920 the railways consumed 42.6% of the coal production, the desirability of lessening this coal consumption is apparent. Thorough inspection of a steam locomotive requiring from 4 to 10 hours is required at the end of each run of from 100 to 120 miles to permit the cleaning of fires, the overhauling of machinery, the caking of flues, etc. At the same time the life of an average locomotive is placed at 75,000 running miles.

As against the steam locomotive, the electric locomotive has the reserve of the entire central power house with all its economies behind it and can draw as much power from the line as it needs for the load to be hauled, restricted only by possible overheating. The coal consumption in the central station per horse power hour is only from 2 to $2\frac{1}{2}$ lb., and if hydro-electric energy is used this is entirely saved. A greater ratio of the total weight on the drivers is attainable than in the case of steam locomotives, thus giving a higher tractive effort for the same weight of locomotive. On account of the necessity of less inspection and less repairs than for steam locomotives the repair shop capacity may be cut to about one-third that for steam locomotives and operating divisions may be made from 200 to 400 miles in length. Electric locomotives have been known

to run for nearly a month without going to the round house. There are no water tanks, fuel stations, ash pits or turn tables required under electric operation. Further, the possibility of regenerative braking increases the economy of operation, it having been found in the case of the Chicago, Milwaukee and St. Paul Railroad that under this system from 12 to 16% of the current is returned to the line. A factor of great importance, too, in winter operation is the fact that electric locomotives are not delayed, as steam locomotives often are, by the inability to keep up steam.

Operating results on the electrified proportions of the New York, New Haven and Hartford Railroad; the Butte, Anaconda and Pacific; the Norfolk and Western; the Chicago, Milwaukee and St. Paul, and the Pennsylvania Railroads, have apparently been wholly satisfactory. The extension of the electrified zone of the C.M. & St. P. from an original 438 miles to 647 miles after an operating experience of two years with the first division, would indicate the economic practicability of electrification under such conditions as existed on this portion of the line.

It is not to be assumed, however, that any and every railroad might advantageously electrify, even though a plentiful, cheap and reliable source of power may be available. So great are the capital costs of electrification, amounting in all to from \$30,000 to \$50,000 per mile, that heavy traffic must be assured to meet fixed charges on the investment. Although the Canadian Pacific Railway has been investigating electrification for some time past, it has not been able, so far, to find any portion of its lines that might profitably be electrified.

Motive Power for Light Traffic

So great have been the operating difficulties of the railroads in the past few years that the continuance of branch line service has been in many cases at a great loss. As a result, during the past four years in the United States 4,032 miles of steam railway were abandoned and only 2,700 miles built. During the year 1921 alone, operation of some 1,600 miles of steam lines was either suspended or discontinued. To meet this difficult situation, interesting experiments have been carried out on branch lines in the way of substituting more economical train units than have heretofore been used. For some time a gasoline-electric car was tried out on the Central Ontario Railway, a part of the C.N.R. system, with results that appear to have been successful. An electric storage battery car is now operating on a 63-mile stretch of line between Campbellton and Bathurst, N.B., and is said to be saving \$2,500 a month in operating expense over that required for a minimum steam operated train.

Gasoline motor cars, very similar to motor buses, have been tried out with satisfaction on the Brockville and Westport line of the Canadian National Railway, and on the Cross Creek-Stanley line in New Brunswick, where there is said to be a saving of over \$1,300 per month. The New York, New Haven and Hartford railroad has for some time operated several suburban and branch lines in this manner at one-third the cost of a two-car steam train. In view of the fact that a single car replaces at least a locomotive, tender and combination baggage and passenger car, and that a crew of two replaces a crew of four, the economy of the motor car for light traffic is apparent. Apart from operating difficulties in cold weather, this development is a promising one for light passenger and express traffic.

Railway Construction

Recent improvements carried out by the C.P.R. in the Rockies are instances of progressive railroading so far as line betterments are concerned. A characteristic example is the elimination of the "Big Hill" in the Kicking Horse Pass between Hector and Field. Here 8.2 miles on grades of from 3.5 to 1.5% have been brought down to a 2.2% grade. The lengthening process required two spiral tunnels on 10-deg. curves carried into the sides of Mount Cathedral and Mount Ogden.

Another piece of work meriting particular attention completed by the C.P.R. during the war was the construction of the five-mile Connaught tunnel, the longest in America. This tunnel which pierces Mount Macdonald in the Selkirk lowers the grade at the summit 540 ft. and eliminates 15.54 miles of 2.2% grade, reducing the length of the line five miles and eliminating two long spiral loops and many miles of expensive snow sheds.

Water Transport

Transportation by water has had a long and interesting history from the primitive "goofah" used on the Tigris since Biblical times and the kayak of the Eskimo to the modern Atlantic liner. The turning point in the success of the steam vessel occurred about the same time as that in the success of the steam railroad. In 1788 John Fitch propelled a craft by steam a distance of twenty miles along the Delaware river, and in 1801 William Symmington towed two 7-ton barges along the Forth and Clyde canal in six hours behind the steamboat Charlotte Dundas. Fulton's Clermont, in 1807, covered 150 miles between New York and Albany in 32 hours. Following success on inland waters, attempts were made to propel vessels across the Atlantic under steam power, and this was successfully carried out when the Royal William crossed from Quebec to England in 1833.

Perhaps the most remarkable vessel ever constructed was the 680-ft. Great Eastern built by the great Brunel in 1858, ostensibly for the making of trips to Australia and back without the necessity of recaling. Traffic available at the time was not sufficient to bring success in an economic sense, but the Great Eastern served a very useful purpose in connection with the laying of the Atlantic cables. This vessel was the original unsinkable ship being built, as were post-Titanic ships, with a double skin.

With the development of the steam turbine, oil burning, and the application of the multiple propeller to propulsion, the magnitude of ocean craft has greatly grown, resulting in such ships, for example as the Leviathan with a length of 927½ ft., a tonnage of 54,000 and engines of 90,000 horse power. In a few weeks, the Majestic, 933½ ft. in length, of 56,000 tons, will have made her maiden trip. Since the tonnage of ships increases as the cube of the dimensions, and the power required increases at a less rapid ratio, there is apparently no limit to the size of ships except that imposed by harbor and dock facilities and the traffic available.

Canals

France has been particularly progressive in providing facilities for inland water transport, there now being some 3,000 miles of canals in that country. In the British Isles there is about the same mileage, although these canals have been gradually acquired by the railways and allowed to go into disuse.

An interesting comparison may be made between the outstanding features of the Panama canal and the principal works of the new Welland canal. While the locks at Panama are 1000 ft. long and 110 ft. wide the maximum lift is only 30 ft. In the new Welland canal the locks will be 800 by 80 ft., but each of the seven will have a lift of 46½ ft., so that so far as lift is concerned these structures are the more notable.

The projected improvement of the St. Lawrence raises some vital questions in transportation economics, some of them having an important bearing on the New York State Barge Canal. As an instance of the value of the predecessor of this work in supplying transport before the days of the railway era it is interesting to note that before construction of the Erie Canal it cost \$100 a ton to transport freight from Buffalo to Albany, whereas after the opening of the canal in 1825 the cost dropped to \$3 a ton.

The official inauguration of the Batiscan Bridge will take place next June according to information given by Hon. Antonin Gallepaunt, Minister of Public Works and Labor for Quebec, who will officiate at the event. Ten other bridges built under the supervision of the Government will also be opened during the summer.

CONCRETE ROAD SURFACES*

Maintenance of a Smooth Road Surface — Effect of Temperature Changes on Concrete — Cause of Expansion — Sub-Grade Drainage — Aggregate Uniform in Quality

By L. A. Pardo,
Kent County Road Superintendent.

DURING the past few years a great deal of study has been given to the construction and maintenance of concrete roads, and many splendid articles have appeared in our journals from time to time so that it does not seem probable that anyone can add much new matter of interest. I will therefore only attempt to review the situation as I find it, dealing as closely as possible with the various factors that function for and against the construction and maintenance of an "Intact and Smooth Riding Concrete Surface" on highways.

As soon as we are able to build such a road, of modern and approved design, the surface of which remains intact and smooth throughout its life of twenty years, then we have reached a stage of skill in that particular form of construction almost beyond criticism, regardless of the method adopted in its construction, for after all is it not the surface we are after? It is the surface we see, look at, examine and use and from its appearance we dare to judge much. If we find it in a state of perfection we must be satisfied, for the object of our efforts has been attained.

Such a condition, however, is seldom found, and if we want it we must consider carefully the various factors that work against it and finally a practical method of eliminating them. My remarks are mostly applicable to the construction of concrete roads in suburban areas and particularly applicable to the conditions found in the County of Kent, where the soil is mostly a heavy plastic clay, the country very flat and the ground water level, which is controlled by the adjacent rivers and lakes, about six feet from the surface.

Local Climatic Conditions

In a country where temperature varies over one hundred degrees, great stresses must be expected and the destructive work of this powerful agent is plainly observed not only in every piece of construction for which man is responsible, but in our rugged mountains and on our rocky shores. If a concrete pavement is so constructed that it absorbs any appreciable amount of moisture, subsequent cold weather will cause sufficient expansion to loosen pebbles and minute particles at the surface, which are later whipped out of place by the wind or passing vehicles, thus providing greater facilities for this agent to carry on its work which although comparatively slow, is very persistent and certain to produce holes of various sizes on the surface. It therefore seems that every effort should be made in the interest of permanency to produce at the surface a concrete that will absorb a minimum amount of moisture.

Effect of Frost on Concrete

It is equally important in the interest of a smooth surface that good drainage should be provided so as to reduce as much as possible the percentage of expansion in the ground, beneath the pavement and in the shoulders. Water expands ten percent in freezing. Perfectly dry earth would not show any appreciable effect from frost at all, but such conditions cannot be found or expected so that the rate of expansion in our coldest weather lies between zero and ten per cent, and the nearer it approaches zero the ideal condition, the less will be the disturbance in the foundation of the concrete road. It has been observed that cracks occur usually when the frost is going out of the ground in the spring and not during the period of freezing, or in other words, when the ground is contracting under the pavement. This would suggest to us that during the period of expansion

which is usually gradual the expansion was downward or toward the sides owing to the weight and great strength of the slabs. When the thawing process begins, subgrade and pavement in obedience to the laws of gravity, settle downward, natural beams form in the subgrade on account of its varying compactness producing cracks which open on the surface and admit more moisture if not properly repaired. Once this natural adjustment has been made, future changes are slow to occur usually provided the conditions with regard to drainage and moisture are constant.

The explanation of this subgrade movement during the first twelve months and its comparative inactiveness thereafter, requires some investigation. The majority of breaks that occur in the surface of pavements are due to foundation movements, and not expansion within the concrete itself. I am of the opinion that a critical analysis of any subgrade for a depth of 4 or 5 ft. below the surface would reveal a great variation every few feet in compactness, density and porosity, consequently when the action of frost begins, its intensity will vary in accordance with those conditions producing a network of beams by the ground probably the least disturbed and these conditions obtain once the adjustment is made so long as conditions of drainage remain unchanged. It would seem then that a subgrade of uniform compactness is very essential and that can only be attained by breaking up the roadway to some depth below the proposed subgrade level, disturbing as much as possible all natural arches and pockets formed through ages and earlier construction, and finally recompacting the same by proper rolling.

The climatic conditions of Canada are rather extreme and they present to the Canadian engineer and road builder problems not considered in many parts of the world. The moderate climate of the British Isles is conducive to successful good road construction and particularly their low cost of maintenance, considering the amount of traffic, and again the topography of the country is such as to permit excellent drainage.

Subgrade Drainage

Good drainage should be provided to the subgrade of any pavement in a locality where a freezing temperature obtains for any length of time sufficient to penetrate it. Some soils have natural drainage, and in some localities the natural ground water level is many feet below the surface and some soils are quite impervious, offering almost complete resistance to the transfer of water from the surface to points deeper down where it will not freeze. Some soils absorb a great amount of water and like our heavy, clay soils become spongy and plastic. Owing to the uniform support which the subgrade is intended to give to the concrete slab surely we cannot afford to allow it to saturate and freeze, such a process would be most destructive. Almost all specifications for the construction of large engineering work require that foundations shall go below the frost and that concrete must not be deposited on frozen ground. In the construction of highways, we can eliminate the latter but we cannot go below the frost line for our foundation, consequently our attention should be turned to some practical means of preventing the subgrade from freezing. How can it be done? It is my opinion that the subgrade must be dry, or as free as possible from moisture without which the action of freezing temperature is not much to be feared. The various methods of providing drainage is somewhat beyond the scope of this paper but it has been introduced to suggest how poor drainage in co-operation with the cold weather may be held responsible for the majority of cracks and settled joints almost invariably found on our concrete roads.

Expansion of Concrete

In addition to the destructive effects resulting from poor drainage and cold weather, an extreme range of temperature is responsible for many cracks on account of the expansion of the concrete itself. These are noticeable, particularly at joints where the blocks push together, chipping thin slabs off the surface and at the edge of the pavement a triangular break frequently occurs. Where many sags and

*Paper read at the Eighth Annual Conference on Road Construction, Toronto.

summits occur in the grade "creeping" of the slabs towards the sag may be expected. The extent of such depending upon the grade line and the length of the tangents to the vertical curves. Excessive strains would then be developed in various parts of the slab or block and great compression would occur at the joints towards which the greatest movement occurs.

It is difficult to prevent deterioration caused by expansion alone. Elastic joints are inserted at intervals of from 30 ft. to 50 ft. in accordance with various specifications and practice but the fact that most damage to concrete surfaces on account of expansion occurs at the joints has led many cities and suburban districts in Canada and the United States to abandon their use, except that a joint is made at noon and at night or any other time when pouring operations cease for longer than thirty minutes. However, in a climate such as this, it is difficult to believe that the joint is not of some use in saving the pavement from the effect of expansion.

Foreign Materials

It frequently happens that foreign materials, such as clay, wood, clinkers, coal, coke and bones are found in considerable quantity in the aggregate, and they almost invariably show up at the surface during the first year or two, owing to their specific gravity they work to the top or nearly to it during the finishing process and if not observed by the finishing gang and removed they are covered over by a thin film of grout, which soon chips off, and very shortly conspicuous 'pits' may be observed in the road. Aggregates containing a considerable quantity of such materials should be avoided if we wish to get away from the unsightly holes so often present on the surface of road and sidewalks throughout the country.

Uniform Aggregate

If we wish to obtain a smooth riding pavement we must pay some attention to the uniform quality of the aggregate, that is so far as specific gravity, wear and toughness is concerned. It is generally admitted that a certain amount of separation unavoidably occurs when the batch is deposited, although we talk about preventing it in various ways. It is also a known fact that the softest rocks are the lightest and if sufficient agitation is provided during the finishing operations, it is natural to expect that the materials will arrange themselves in the mass in accordance with their specific gravity, that is the softest on the surface and the degree of hardness increasing towards the bottom. Such an arrangement of aggregate would favor absorption of water, aiding the action of frost, and resulting in wear. Many gravel pits contain an aggregate in which there is a high percentage of stone that can be ground up with ease, this may be expected to cause uneven wear which in turn would increase impact from traffic and further destruction to the surface, giving a rough riding and rough appearing pavement.

Workmanship

In addition to the foregoing causes of poor surface on concrete roads, its riding quality can of course be improved by careful workmanship in setting forms to grade and in finishing, care must be taken to have the surface of the concrete on both sides of the expansion joint at the same elevation, and the finishing, whether it be done by the belt-ting system or by hand, should as far as possible leave no irregularities sufficient to cause impact from vehicles.

At the last monthly meeting and supper at the Green Lantern, of the Halifax Branch of the Engineering Institute of Canada a most interesting paper originally prepared by Capt. R. R. Murray, on war engineering underground in France, was read by Mr. Hardy, Mr. Murray being absent through illness. It dealt largely with work of Canadian tunnelling companies in Ypres sector and was illustrated by slides. It proved one of the most interesting papers the engineers have heard during the year.

ALBERTA PROFESSIONAL ENGINEERS MEET

PROFESSIONAL engineers of Alberta held their annual meeting and banquet at the Macdonald Hotel, Edmonton, on March 25. Past president R. W. Brown, of Calgary, was in the chair, and there were present about 150 engineers from all parts of the province.

It has come to be a recognized fact that the professional engineer occupies a high public place and performs a most valuable service to the community and to the nation, and in all the addresses given during the course of the banquet, this fact was clearly brought out.

Following a toast to the king, proposed by R. A. Brown, Sam G. Porter, engineer in charge of construction and maintenance of the Lethbridge C.P.R. irrigation district, proposed a toast to "Our Country." He summarized the unique position which Canada holds in the world, by virtue of its natural resources, telling of the abundant wealth which, undeveloped, is in the possession of the Dominion. The immense forests, the mineral wealth, the fertile soils which lie within the boundaries of Canada were of untold value.

Premier Greenfield, in replying to this toast, dwelt particularly upon the future development of the province of Alberta.

In proposing a toast to the engineering profession, C. J. Yorath, city commissioner, pointed to the necessity of the professional engineer in rural, urban and national life. He felt certain that the guiding hand of the engineer would contribute in the future to the formation of a national policy which would be for the betterment of economics and industry.

Replying to the toast, R. W. Boyle, dean of the faculty of science in Alberta University, said the engineer is at last assuming his true place in community and national life. Such questions as highways, irrigation, natural resources, and others of vital interest to every citizen, require the expert opinion of the qualified scientist.

Dean Boyle also recommended that a survey be made by competent engineers of all natural resources within the province, soils, forests, minerals, etc. He did not anticipate that the natural resources would be returned to the control of the province within the next few months but it was inevitable that they should in due course, and it was advisable that some idea be gained of their value. He said certain members of the faculty of the University of Alberta had made a private investigation of the value of Alberta's natural resources and had been so impressed with the information secured that they had urged upon the late government the desirability of securing control at the earliest possible date.

WATER POWER ON ST. MAURICE RIVER

WATER powers in Quebec was the subject of an address delivered by Olivier Lefebvre, chief engineer for the Quebec Streams Commission before a largely attended meeting of the Quebec branch of the Engineering Institute of Canada at the Chateau Frontenac, on March 21. He pointed out that the available water power of the St. Maurice river of 500,000 h.p. was along only thirty miles of its course. Its possibilities might equal not less than a million horse power. Mr. Lefebvre touched at considerable length upon the Gouin dam, which, he said, would stand an ice pressure of 50,000 pounds per foot, but strangely enough no ice had formed within a hundred feet of the gates. There was no unanimity of opinion respecting the influence of ice pressure on dams. Arthur Fournier, in the course of an interesting address during the evening touched upon the value of the coal tar industry. He dealt largely with the production of coal tar but dealt with all manners of by-products arising from the industry.

Electrification of railways in Ontario and Quebec was discussed in the House of Commons, Ottawa, recently. Arguments in favor of the scheme were advanced by Homer Deslauriers of Montreal and W. S. MacLean of Toronto.

BITUMINOUS TREATMENTS ON MACADAM ROADS*

Surface Treatments Vary in Character—Thin Coats Recommended—Buying and Unloading Bituminous Material—Distributors—Covering Material

By Alan K. Hay,

Engineer to Ottawa Suburban Road Commission.

SURFACE treatment of macadam roads with some form of bituminous material has now become necessary to prevent rapid deterioration caused by surface stone being ground into dust or mud under ever-growing traffic. If surface treatments are used with discretion, the life of a road is considerably prolonged and maintenance charges are lowered. A good macadam road treated with tar or oil shortly after its construction and consistently re-treated each succeeding year will render excellent service under a very considerable volume of traffic, more especially if the bulk of the traffic is carried on rubber tires. However, heavy horse-drawn loads on steel tires are its worst enemy and in the spring of the year such a surface will cut up badly, if subjected to much of this class of traffic. On the other hand, the tires of automobiles and light or medium sized trucks have the effect of ironing out the surface and do it comparatively little harm.

Surface treatments vary in character from a very sketchy cold application of light oil or tar used as a dust layer to heavy coatings of binder accompanied by a substantial coat of fine crushed stone.

Local Conditions Govern Type of Treatment

The type of treatment for any given road can be decided only by local conditions but in general the most successful type of surface will be one falling midway between the limits above. Partially worn out roads with surfaces showing only a small amount of exposed stone may often have their effective life prolonged a few years by an application of one of the lighter liquids without any covering material. The better class of macadam surfaces should have an application of heavier material which has been heated and should then be covered with a thin coat of stone chips, pea gravel or sand.

On this kind of road, the mistake is often made of endeavoring to build up too thick a carpet or blanket on the road in one operation. The result is a surface which looks well and wears well for a few months and which closely resembles an asphaltic concrete or penetration built road, but in a short time this blanket of tar or asphalt pushes into waves and humps and if there is much horse-drawn traffic to cut it, will often peel from the road metal in large areas.

This unfortunate result may be avoided by applying the bituminous material in smaller quantities, building up a thin skin coat upon which subsequent light treatments may be applied, gradually forming a tough thin film over the road. On a newly constructed macadam road, a treatment during the first season of one-third of a gallon per sq. yd. followed by one-fifth to one-fourth gallons in the following years should in most cases, be sufficient.

A large quantity of material is now on the market which is suitable for applying to the road without heating, but usually it will pay to heat even fairly light oils or tar products in order to secure a greater penetration into the road surface. The slight additional expense and trouble of heating is more than offset by the better results obtained.

Methods and Appliances

There are two ways of purchasing bituminous material, either in tank-car shipments or in barrels and drums. Tank car shipments are by far the most satisfactory and material should not be bought in barrels, unless

the amount of road to be treated is extremely small or railway facilities are wanting.

The average tar or asphalt used for this work may be unloaded from the tank car without heating it, unless the weather is exceptionally cold. Some organizations prefer to heat it in the car by means of a portable boiler connected to the heating coils and then convey it to the road in a distributor which has been insulated in some manner to retain the heat. On my own work, I have found it convenient to unload the material cold and afterwards heat it in the distributor while on the way to the place where it is to be used.

There are several standard methods of unloading. If there is a large amount of road surface to be oiled or tarred each year, and which is concentrated within a fairly compact area of country, it will pay to put in a siding with an elevated trestle, up which the tank car may be run and then unloaded by gravity into storage tanks or distributors.

However, on most work the initial cost of this installation might not be justified, and arrangements must be made to utilize various sidings located as near as possible to the work in hand. In this case a portable pumping outfit is a necessity. There are several excellent pumps on the market designed for the handling of viscous liquids of this nature and if funds are available such a pump would be a good investment. On my own work, we use a make-shift outfit which operates quite satisfactorily under average conditions. It consists of an ordinary good-plunger hand-pump, commonly known as a tank pump, operated by a one and one-half horse power engine and pump jack. As an auxiliary we use a Tarco hand pump, which is a sheet metal affair closely resembling a bilge pump used on boats.

The motor driven pump is connected to the bottom of the car by a pipe 2 or 3 in. in diameter or by a flexible steel hose. The asphalt and tar companies are standardizing their tank cars so that a few standard connections carried in stock will fit most tank cars that are now on the railroads.

Distributors

For the usual amount of work handled by counties, especially when at some distance from the larger centres of population, a horse drawn distributor will prove most economical. Very few counties have a sufficiently concentrated mileage of road to justify the purchase of a large unit mounted on a truck and in addition the ground in the neighborhood of our usual railway siding is of such a nature as to make it difficult for trucks to approach the tank car, more especially after a shower of rain. A horse-drawn machine of five hundred gallons capacity may be operated economically on hauls up to four miles and for longer hauls may be equipped with a short pole and hauled behind a motor truck. On the suburban roads near Ottawa this year we are contemplating equipping a 15-27 tractor with rubber tires for handling distributors on the longer hauls, when the tractor is not engaged on grading work. For short hauls with moderate grades one team of horses is sufficient but if there are many hills two teams will be required. By using two distributors, lower costs will be obtained. One will be filling at the siding while the other is on the road. The investment required is not large, as the average machine with jets, rotary pump, kerosene tank and burners, should not cost much over \$1,000. In purchasing a distributor, an important requirement is that it shall be fitted with an efficient device for straining the liquid before it passes through the jets. If it is not provided with proper screens or strainers, small particles of sand or carbon will block one or more nozzles and cause exasperating delays on the road.

Sweeping

It seems hardly necessary to say that the road surface should be thoroughly cleaned before oil or tar is applied. A horse-drawn revolving broom is of very great

*Paper read at the Eighth Annual Conference on Road Construction, Toronto.

value but should usually be followed by a few men with stable brooms to touch up spots which may have been passed over by the large sweeper. Applying bituminous material on a dusty road almost invariably results in a poor job.

Covering Material

Many specifications call for stone chippings or pea stone as a covering material. If crushed from good hard rock, stone chips make an excellent cover, but if composed of soft lime stone the advisability of using them is doubtful, as lime stone pulverizes very quickly under traffic. Furthermore stone chips or screenings are usually not to be had, or when available are urgently needed for other purposes in the road construction.

Pea gravel or coarse sand are the materials most commonly used. Of these I have found gravel superior as it wears better, gives a gritty surface which provides better foot hold for horses and will not blow away in the first breeze as will much of the sand which is commonly used for this purpose. If screened pea gravel is too expensive, a fine pit-run gravel may be used. It will be necessary to rake the surface of the road to draw the larger stones or pebbles to the shoulder, but this adds very little to the cost of the operation as there are often idle periods for the spreading gang while waiting for the distributor, during which two men with rakes will quickly cover very long stretches of road.

Various systems are used for handling sand or gravel. In town or city work it may be deposited in little piles along the road, twenty or thirty feet apart, from which it is spread direct, by men with shovels. In county work, on roads where there is no curb, these small piles of sand have a tendency to shrink before the time comes to use them, as they are easily dissipated by the traffic. Another system is to dump the sand or gravel in two yard piles, spaced 150 ft. or more apart and rehandle it from these piles, using a couple of one-horse dump carts. Five or six experienced laborers with two dump carts will cover about three-quarters of a mile of 18-ft. road per day under favorable conditions. In this connection it will be found that spreading sand for this purpose is an art in which every laborer is not proficient and the success of which is largely influenced by the skill of the men who do the spreading.

Mechanical spreaders may also be used where conditions are suitable. The amount of cover required may vary all the way from five pounds to twenty-five pounds per square yard and no general rule may be laid down as this is entirely a matter affected by individual conditions on each job. In general the heavier the bituminous material used, the larger will be the amount of cover required.

Costs

The cost per square yard of surface treatment is very largely influenced by the unit amount of tar or asphalt used and by its cost per gallon. Analysis of several jobs last year, where the haul was within four miles and for an application of one-third of a gallon of heated material per square yard, showed a total cost per square yard of from six to seven cents. This included bituminous material, sand, labor and fuel.

CANADIAN SECTION OF WATERWORKS ASSOCIATION TO MEET IN BRANTFORD MAY 12

BBRANTFORD, Ontario, has been selected by the officials of the Canadian section of the American Waterworks Association as the place for the annual meeting for 1922. The dates, May 12 and 13, have been chosen so as to enable members who wish to attend the Philadelphia Convention of the American Waterworks Association to continue the trip with a minimum of expense and time.

The Brantford Chamber of Commerce and other civic bodies are making special arrangements to ensure the success of this event, which will be the second annual meeting of the Canadian section. The program, when completed,

will contain several good papers, and it is expected that important discussions will follow, as was the case at the first annual meeting held last year in Toronto. The papers will include "Filtration Plant Organization," "Government Control of Sewage-Disposal Plants," and "Standardization of Hydrant Threads."

The committee in charge of the meeting has decided to invite waterworks supply firms to exhibit materials and machinery of interest to town and city engineers and waterworks officials. Space will be provided free of charge in a room near the meeting hall. The attendance at the last annual meeting of the section was approximately 125, and included members from all over Ontario and a few from other provinces. Shipments of materials for exhibition should be addressed to the exhibitor, care of the Canadian section of the American Waterworks Association, Chamber of Commerce Rooms, Kirby House, Brantford, Ont. An invitation to exhibit their goods is extended to all Canadian manufacturers whether they are or are not members of the American Waterworks Association. Further information may be obtained from C. D. Brown, Walkerville Waterworks Co., Walkerville, Ont.

NATIONAL HIGHWAY TRAFFIC ASSOCIATION

NATIONAL Highway Traffic Association annual meeting will be held at the Automobile Club of America, 247 West 54th Street, New York City, on Friday, May 12, 1922. The afternoon and evening sessions will be devoted to a consideration of the reports of the following national committees:

Afternoon Session — 2:00 P.M.

Report of National Committee on "Uniform Highway Signs." Chairman, Elmer Thompson, secretary, Automobile Club of America.

Report of National Committee on "Traffic Capacity and Widths of Highways Outside of Municipalities." Chairman, Herschel C. Smith, assistant professor of highway engineering and transport, University of Michigan.

Report of National Committee on "Status of the Construction of Highway Curves and Recommended Practice to Increase Safety to Traffic." Chairman, H. Eltinge Breed, consulting engineer, New York City.

Reports of Executive Committee on "Highway Improvement Creed" of the National Highway Traffic Association.

Informal Dinner — 6:00 P.M.

An informal dinner, at \$1.50 per cover, will be served in the grill room of the Club at 6:00 p.m. The public is cordially invited to attend the dinner. Reservations for the dinner should be sent to the secretary, Elmer Thompson, 247 West 54th Street, New York City.

Evening Session — 8:00 P.M.

Report of National Committee on "Regulations Governing Speeds, Weights and Dimensions of Motor Trucks and Trailers." Chairman, George H. Pride, president, Heavy Haulage Co. of New York City.

Report of National Committee on "License Fees and Motor Vehicle Taxation." Chairman, Henry G. Shirley, roads and sanitary engineer, Baltimore County Roads and Sewerage Department.

Report of National Committee on "Highway Transport Franchises." Chairman, F. W. Penn, secretary, National Motor Truck Committee, National Automobile Chamber of Commerce.

Report of National Committee on "Highway Transport Clearing Houses." Chairman, Tom Snyder, secretary, National Association of Commercial Haulers, Indianapolis.

The Anderson Foundry & Machine Co., Anderson, Ind., manufacturers of the well-known Anderson oil engine, have opened a branch house at 2825 West Harrison St., Chicago, Ill., with R. E. Gray as manager. The Chicago office have on display in their salesroom a 30-h.p., Type-K oil engine, and will attend to the sale of Anderson oil engines in the territory tributary to Chicago.

EARLY PREPARATION OF ROAD BUILDING PROGRAMS*

One Season Work Only a Unit in General Scheme — Primary and Secondary Roads—Advantages in Early Preparation of Work for Season

By Frank Rutherford
Lincoln County Engineer

PREPARATIONS for buildings roads should not be confined to one working season for if such seasonal limit is made there is a strong possibility of having a disjointed product and it would seem to the writer that each year's work should be only one unit in a preconceived structure and that each season's work enters into the scheme only as one step nearer to a final completion of a defined program. We should look upon a road program with a broad understanding of what we ultimately want to do. The whole scheme should be definitely considered and worked out after a careful study of the many things that make up the component parts of a road system. The county road system was inaugurated to provide a better type of road suitable for all the year traffic, leading from centre to centre of population and to give access to the shipping points most frequently used by such populations not centred in urban municipalities.

Primary and Secondary Roads

The earliest preparation necessary would seem to be a comprehensive study of existing conditions, detailing present and anticipated traffic and from such analysis, the route to be followed could be determined. From the same census the importance of the various roads could be ascertained and these roads might be classified into two main divisions of primary and secondary roads. This determination of the importance would then suggest that on a primary road, to carry a more or less accurately ascertained traffic, a heavier and better type of foundation and more lasting surface treatment would be required and provision made for such program before any construction work is done.

The secondary road is not necessarily a through road but should be made as nearly so as possible, although the traffic requirements will practically determine its character.

The whole county road system should be divided somewhat as above, the primary road being the first to be constructed. If this division were made and adhered to, it would make the County more or less accurately determine the financial requirements and enable them to construct such types of road as would ensure a minimum of maintenance charges with a maximum length of service of the road they construct.

Too much stress cannot be laid on this early preparation of the program because it would seem that a great many counties have more mileage of roads in the system than can be economically constructed up to a requisite standard. The tendency is to try and construct all roads in the system without giving enough thought to the primary road without which the secondary road would be of reduced value. Unless such primary road is adequately constructed there is an increased reduction in the usefulness of the work, both primary and secondary..

Program Should Be Prepared Early

The yearly program is only an incidental in the development of the road scheme but is as important in its detail as is the whole general scheme. In this province the climatic conditions are such that there is a sharp break in the building season of each year and this break has led us to consider each season as a unit. As the whole general scheme should be prepared in advance so should the yearly program be prepared well in advance of the actual building season. The building season may be considered as extending from May to October except in exceptionally fav-

orable years and the program for that reason should preferably be determined in the months of November and December. All necessary preliminary data can be then ascertained to so great an advantage in January and February that with the data available from the year previous, the two winter months can be very usefully employed in working out detail which is apt to be neglected when the rush of construction is under way.

Would Help Manufacturers

This early detail preparation would make it possible to have all the next season's requirements of steel for bridges, culverts, guard rails, etc. ordered and delivered at a time when the demand naturally is slack and would have a tendency to better service all round. It would also give the manufacturer some idea of the requirements to be met and he would also prepare his plans accordingly for any portion of the work which would be allotted to him. It would enable him also to produce his goods at a somewhat better standard by allowing his organization to give more and better attention to detail which he could not do when things are ordered in a hurry.

By the early preparation of the yearly program, the superintendent can study out the source of supply of his materials and complete his plans and organization for the most efficient handling of such material, and if the work is to be done by contract it gives the contractor ample time to thoroughly consider the work and to gauge his organization to meet the season's demand. It enables both county and contractor to start at the beginning of the season instead of waiting until a portion of best building season has passed away.

ROAD PROBLEMS IN CANADA

IN AN address before the Ontario Good Roads Association at the recent convention in Toronto, S. L. Squire made some interesting remarks regarding the road problems in the Western provinces. We have in the Dominion of Canada 610,000 miles of surveyed roads. There are in the Province of Ontario 61,000 miles of roads, which include 11,000 miles of colonization roads in Northern Ontario.

In the Province of Alberta there are no less than 250,000 miles of surveyed roads, and in the Province of Saskatchewan there are 210,000 miles of surveyed roads, and in the Province of Manitoba there are 70,000 miles of surveyed roads. We have one third of the population of the Dominion in the Province of Ontario, and yet in the Province of Alberta they have four times the amount of road mileage that we have in Ontario, and they have only one fifth of our population. We have the advantage of some of the other provinces in that we have a more dense population, and we have road material at hand. In Alberta and Saskatchewan, for 400 miles from east to west and 150 miles from north to south there is not sufficient stone, if it were all gathered together to put in a foundation for one road, and that will give you some idea of the problem they have to solve in the matter of road building.

The problem in the Province of British Columbia is a matter of grading and continuity of highway construction. The scattered populations in that province are separated by hills and mountains that are insurmountable as far as road building is concerned. When we consider the problems of the other provinces then we see that the problem that we have to solve in Ontario is not such a very difficult one as we might imagine.

CANADIAN FIRM HAS FORT FOUGE CONTRACT

WORK has commenced in the plant of the Northern Electric Co., Montreal, on the automatic telephone equipment to be installed in the 6,600-line Fort Rouge exchange in Winnipeg. This contract was obtained by the Northern Electric Co. at a price of \$423,254 and will be the first installation of Canadian-made automatic equipment in the Dominion.

* Paper read at the Eighth Annual Conference on Road Construction, Toronto.

Letter to the Editor

ROAD CONSTRUCTION

Sir: The article on "The Structural Design of Pavements," by A. T. Goldbeck, in your issue of February 14, 1922, goes far to indicate the principles that underlie the building of roads to stand up under modern traffic.

There has been a plethora of warnings from the roadmaking practitioner to take care of drainage, as witness the great ditches that flank his roads and now at last the rationale of this phase of road making is being developed. In this connection, may I put forward a few remarks which have a bearing on the problem?

In all roadwork three factors are pre-determined: the soil at the location is unalterable, the surface treatment is dictated by financial conditions, and prejudices, while the duty expected of the structure is the maximum that it can be made to bear economically. The matter thus resolves itself into such treatment or modification of subsurface conditions that will make the total cost during the life of the funding, a minimum.

In the early macadam roads, the effects of moisture and frost soon made themselves evident and Telford took a great step when he placed a layer of rubble under the pavement crust; the cavities forming a sump for the small amount of water finding its way through the cover and preventing the capillary rise of water from the soil.

This is exactly the end to be sought and in my mind the integrity of all pavements will be secured just as soon as a sufficient thickness of a moisture resistant medium is interspersed between the ground and the pavement.

I may quote an example or two to illustrate the point. On a certain Eastern railway built on a cotton soil country, where winter fallowed fields after a couple of days rain allow one to sink to the shovels, stabilizing the roadbed presented a problem. The operation of one of the yards closely followed construction, just as the rainy season commenced and it was very important that delays be reduced to a minimum. The precise conditions being new, a suggestion was made that a light ballasting with sand might at least help and 1 in. to 6 in. of coarse sand was worked under the track with the very best results for during a particularly wet spell the yard was operated without a derailment.

At another location on similar soil and equally mature construction, the following wet season, traffic exigencies prevented the operation of work trains and derailment after derailment occurred due to switches sinking into the mud.

I cannot vouch for the following but believe the facts to be as stated. A certain gravel washing plant for track ballast was designed to remove the whole of the sand from its output. This was put in the track but it was found impossible to keep any surface and only on the re-incorporation of a certain percentage of the sand was the ballast made sufficiently stable.

It would appear from these instances that the moisture content of the ballast must be controlled and the ideal medium between the ground and the pavement must conform to the following conditions:

- 1 That accidental or uncontrollable surface moisture must drain away by the shortest course.
- 2 That the capillary water must be just sufficient to give maximum stability.
- 3 That frost action must be localized so that bulking cannot take place sufficiently to lift the crust.

It is patent that our rural roads at no distant date will have to be macadamized, at least, and this question of the introduction of a modifying medium bears particularly on those that have been made, or are being prepared or extended by men who in general have the vaguest idea of the principles of their work such as councillors and road foremen,

who put a few loads of pit-run gravel in the chuck holes and rutts when the user raises sufficient howl and funds permit.

This pit-run gravel varies by location from a clean river gravel to very sandy pit-run material and I have noticed that in the banks adjacent to the clay and silt "bottom land," the sand gravel predominates. These low grade gravels have maximum capillary action, soak rain in from the surface and draw it from below so that throughout the winter the cover is in the worst possible condition to resist the stresses imposed by traffic. In future the question of finance will practically compel the use of these so called roads as a base for a macadam coating and subsequent failures will impose onerous bond conditions and short life.

With regard to subgrade drainage I have speculated on the wisdom of placing the road, in new work, close against the ditch under such conditions ground water would be levelled more quickly and there are manifest advantages during construction not to mention a possible extension of the season and the convenience to the public.

In conclusion I would suggest the study of track mechanics pari passu with that of pavement physics and urge upon the smaller road authorities, the expediency of having a technical opinion as to their methods and the selection of their materials.

JOHN A. WILSON.

Vancouver, B.C., March 18, 1922.

PROFESSIONAL ENGINEERS

AT THE annual meeting of the Corporation of Professional Engineers of Quebec, held recently in Montreal, the following officers were elected for the ensuing year: A. R. Decary, president; K. B. Thornton, vice-president; F. B. Brown, secretary-treasurer; A. Mailhot, registrar. The other councillors are Arthur Suvever, J. M. Robertson, C. N. Monsarrat, A. B. Normandin and J. E. Gihault. There are now 700 engineers enrolled in the Corporation, an increase of 200 compared with the membership roll at the time of the last annual meeting.

ADVOCATES USE OF LOCAL MATERIALS

ADDRESSING the Rotary Club at the Chateau Frontenac, Quebec, recently, F. A. Hogan, Montreal, manager of the Asphalt and Road Oil Department of the Imperial Oil, Ltd., advocated the use of materials best suited to local conditions, in order to save freight and carrying charges. In the course of his address Mr. Hogan pointed out that Prevost Hubbard, chemical engineer for the Asphalt Association of New York city, would later co-operate with the Department of Public Highways of Ontario to investigate the various deposits of gravel found in Ontario with the idea of utilizing them in the best possible manner. If the results of his trip proved in any way successful the investigations might be extended to the Province of Quebec.

Mr. Hogan said "there is no province which has more deposits of natural lime-stone and other factors which are needed in the construction of various types of road than Quebec. And the main requisites in this type of construction are naturally the ingredients needed to keep out the mud. Any difficulty in this respect could easily be overcome by making a thorough survey of the materials at hand, and having them placed at reasonable prices in keeping with their quality."

The Federal Government has paid \$206,132.20 out of the Federal good roads grant toward the cost of the Hamilton and Queenston highway. The estimated cost of the highway given to the Railway Department for agreement under the Canada Highways Act was \$613,750, for water-bound macadam construction. The cost of laying a bituminous macadam and cement concrete surface on portions of this highway was estimated at \$700,521.50, or a total estimated cost of \$1,314,271.50. The cost to December 31, 1921, for the purpose of securing the Federal grant was \$1,216,651.54.

E. I. C. COMMITTEE ON POLICY

IN APRIL, 1920, the council of the Engineering Institute of Canada held a meeting to which Ontario councillors and branch and division officials were invited for a discussion of various matters of importance to the engineering profession. One result of the conference was a recommendation that the Institute should appoint a Committee on Policy. This recommendation was subsequently adopted by the council; members representing all provinces were put on the committee, with J. B. Challies, Dominion Director of Water Powers, Ottawa, as chairman. The committee was instructed, among other things, to prepare a statement indicating what should be the policies and objects of the Institute.

The question of remuneration of its members, both by fee and salary, had already been recognized by the council as one of the policies of the Institute. The committee has endeavored by correspondence to reach satisfactory conclusions on the many other questions referred to it, but the different views held by the members have rendered the task of deciding upon its recommendations very difficult. Mr. Challies, in presenting a progress report at the recent annual meeting held in Montreal, pointed out the inherent difficulties and loss of time in conducting a postal discussion. After some consideration it was decided that Mr. Challies be empowered to convene a meeting of the committee. This meeting is to be held in Montreal on April 11, and it is anticipated that by a round-table talk it will then be possible to arrive at conclusions or at least to agree upon the salient points.

The various questions of policy have occupied the attention of many branches of the Ontario Provincial Division

as well as of the council, and it is said to be highly desirable that these matters be discussed by the members of the Committee on Policy, so that some action may be taken. Among the questions that will doubtless be discussed, will be that of the classification or grading of members; that is, whether it be desirable to continue the present classification and titles or to modify them. It has often been expressed that the titles of "associate members" and "associates" are rather ambiguous and confusing. Moreover the classes of "students" and "juniors" may or may not be commendable, and the choice between the title of "member" or "fellow" has given rise to some friendly polemics.

Another question that has been discussed is whether all members should be attached to some branch selected by themselves, or, failing that, by the council, and whether the branch areas should be enlarged and made to constitute the territorial voting divisions. At present there are nearly one thousand members who are not residing in the districts of local branches nor enjoying the fraternal features of any branch. They have very little to kindle enthusiasm in Institute affairs. It is felt by many that it is desirable to corral all members into various branches and to elect councillors as representing the branch districts instead of the present areas.

The students' activities will, no doubt, receive consideration, for the future development not only of the Institute but of the entire profession, must necessarily depend upon the students of today. The "child is the father of the man," and it is conceivable that if the latent forces now more or less dormant in the young engineers are carefully nurtured and directed, the future of the profession will be vouchsafed. The question, however, of how to draw out the best that is in the young men, and to develop their powers for the good of the profession, is one that will require earnest consideration.

IMPROVED SHOWING FOR THE RAILWAYS

SUBSTANTIAL improvement for the year 1921 as compared with the year 1920 is apparent from a study of the summary report for the year ending December 31, 1921, recently issued by the Dominion Bureau of Statistics. Considering the steam railways of Canada with an annual operating revenue of at least \$500,000, which represents over 95% of the total railway mileage of Canada, it is found that the ton-miles of revenue freight decreased 17%, and that the passenger-miles decreased 16%. At the same time the total operating revenues dropped 7%, but by reason of economies in maintenance and other operating expenses the net operating revenue increased by 175%. The result is that the operating ratio dropped from 97.34% in 1920 to 92.14% in 1921. The decrease in both freight and passenger traffic resulting in decreases in revenue is not remarkable when it is remembered that 1920 showed the heaviest freight movement in the history of the railways and the 1920 passenger traffic was exceeded only in 1919, and then only slightly.

As might be expected, the operating ratio is highest for the Grand Trunk Pacific Railway, being 124.03%, as against 170.34% for 1920. The Canadian Government Railways are next in magnitude of operating ratio, with the Canadian Pacific Railway best of all with an operating ratio of 80.9% as against 53.83% for 1920. The Grand Trunk Railway is next to the Canadian Pacific Railway with an operating ratio of 92.61% for 1921, as against 93.58% for 1920.

Considerable anxiety will no doubt be expressed in some quarters should a reduction in rates be sanctioned in the near future. During the months of August, September, October and November last, a considerable spread between revenues and expenditures was maintained, but with the reduction of freight rates effective on December 1st this spread immediately narrowed. It is too soon to determine just what the effect will be, but there is good reason for believing that whatever increases traffic is bound in the long run to be beneficial for the railroads.

ROLLING STOCK ECONOMIES FOR RAILROADS

FOR MANY years an extensive operating experiment has been under way on the Great Northern Railway of England which should suggest a possible economy in the operation of Canadian lines. This consists in the use of articulated units of coaches of which there are over two hundred sets in use on the railway mentioned. While at first the plan was wholly experimental, it met with such notable success that it has been constantly extended until the method appears to have become standard practice.

The economy that has resulted from this remodelling of rolling stock is conspicuous. The ends of adjacent coaches are supported on a single truck rather than on two trucks, as is customary. The coupling pin of the coaches so supported is also the king pin of the truck. Two, five, ten or even more cars may be connected together as a unit or set, there being no definite upper limit so far ascertained. The economy is evident when it is considered that with a set of five-car bodies on six trucks there is a saving over the old system of four trucks, involving not only reduced cost, but reduced length of train, reduction of from 10% to 20% in the weight, reduction in the cost of motive power, and improved riding conditions.

So notable has been the success on the English railroads obtained in the use of articulated trains that it is to be expected some investigation of the practicability of this departure on Canadian railroads will be made in the near future.

PERSONALS

C. H. R. FULLER, city engineer of Chatham, Ont., has been appointed to the new position of city manager. Mr. Fuller will continue as city engineer.

FREDERICK CLARK has been appointed superintendent of the Lethbridge-Northern irrigation project for Grant Smith & Co. and McDonnell, Ltd., who are the general contractors for the undertaking.

W. G. A. ADAMS has been appointed chief engineer and general manager of the Oakland Construction Co., Ltd., Windsor, Ont., a new corporation which has been formed to undertake municipal contracts.

S. L. SQUIRE, of Toronto, chairman of the executive of the Canadian Good Roads Association, was in Ottawa last week in connection with the annual meeting of the Good Roads Association which will be held in Victoria, B.C., in June.

NORMAN J. GOEBEL, engineer for the Board of Water Commissioners, Oshawa, Ont., has resigned. Mr. Goebel went to Oshawa as assistant engineer on May 1, 1920, and on February 1, 1921, was appointed chief engineer by the Water Commission.

N. G. McDONALD, town engineer of Oshawa, Ont., has resigned and has accepted a position with Gore, Nasmith & Storrie, consulting engineers, Toronto. Mr. McDonald was town engineer for eighteen months and during that period was in charge of several important undertakings.

A. L. BALDWIN, who has had charge of the provincial highway operations between Kingston and Prescott, Ont., has been appointed to assume control of the same work on the provincial highway between Brockville and Prescott and on the Prince of Wales highway between Prescott and Ottawa, and will shortly move his office from Gananoque to Brockville, Ont.

GEORGE L. WATSON, consulting engineer, New York City, has moved his office to 150 Nassau St., where he will be associated with the George A. Johnson Co., Inc., consulting engineers. Col. Watson is a member of the Board of Consulting Engineers to the New York State Bridge & Tunnel Commission and the New Jersey Interstate Bridge & Tunnel Commission. He has had a wide experience in mining, tunnel, bridge, harbor and municipal engineering, and served with the British and American armies during the war.

H. L. ROBERTS has entered into private practice in Toronto, specializing in research and development work along mechanical engineering lines. Mr. Roberts is a graduate of the Carnegie Institute, Pittsburgh, class of 1904. He came to Canada in 1912, and was appointed to a prominent position with the Russel Motor Co. Three years later he joined the National Steel Car Co., Hamilton, as chief tool designer, and in 1918 he received appointment as efficiency and inspecting engineer for the Imperial Munitions Board. Latterly Mr. Roberts has been mechanical engineer for Business Systems, Ltd., Toronto. Before coming to Canada he was mechanical engineer for the B. F. Goodrich Rubber Co., Akron, Ohio.

OBITUARY

WILLIAM H. ARMSTRONG, for many years a prominent British Columbia contractor, died in Vancouver on April 2 after a brief illness. He was born in Stratford, Ont., 63 years ago. During the war the late Mr. Armstrong acted as controller for the Dominion Government of the coal mines in Alberta and Eastern British Columbia.

Engineer's Library

AMERICAN WELDING SOCIETY PROCEEDINGS. For some time the proceedings of this society have been printed in the "Welding Engineer," but the society will now issue its own publication, the first being recently off the press. The proceedings contain the usual matter relative to the activities of the society, new membership and a number of technical papers devoted to subjects of interest to welders. The proceedings are published at the headquarters of the society, 33 West 39th Street, New York City.

SECONDARY STRESSES IN BRIDGE TRUSSES. Introducing the Graphic Method of Deformation Contour and its Analytic Solution with Scientific Arrangement of Computations—An abstract of a Thesis Presented to the Division of Science and Engineering for the Degree of Doctor of Engineering, Carnegie Institute of Technology, Pittsburgh, by Thomson Eason Mao. Paper; 6 by 9 in.; pp. 61. Illustrated.

The original thesis of which this pamphlet is an abstract was prepared with the object (1) of treating secondary stresses in a more logical, comprehensive and practical manner than is done elsewhere, (2) of introducing three new methods, two graphic and one analytic, for analyzing secondary stresses and (3) of investigating the effects of secondary stress on the design. In this paper two of the three methods are reproduced, with the materials entirely re-arranged and re-written, followed by a set of principles to be observed in reducing secondary stresses in bridge design.

AMERICAN SOCIETY FOR TESTING MATERIALS. Proceedings of the Twenty-Fourth Annual Meeting, Asbury Park, N.J., June 21-24, 1921. Vol. 21—Committee Reports, New and Revised Tentative Standards and Technical Papers. Philadelphia: The Society; Paper; 6 by 9 in.; pp. 1196; Illustrated; In paper, \$10, in cloth, \$11 and in half-leather, \$12.50.

The present volume of proceedings of this important society is entirely in keeping with the high character previously maintained. It contains the annual reports of 31 of the standing committees of the Society, and 24 technical papers, together with the discussion on these papers and reports. It contains also 93 tentative standards which have either been revised or are published for the first time; the annual address of the president of the society and the annual report of the executive committee. Those who have much to do with engineering materials cannot afford to be without a copy.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand or proposed, contracts awarded, changes in staffs, etc.

TENDERS PENDING

The following tabulation is presented as a reminder to contractors in regard to tenders that are still pending, other than those reported in this issue. The word "Issue" refers to the issue of "Canadian Engineer" in which there appeared a notice giving details regarding the call for tenders.

Place of Work	Tenders Close	Issue
Halifax, N.S., highway construction	Apr. 12	
	15 & 18 Apr.	4
Brantford, Ont., road oil, asphalt, Portland cement and castings	Apr. 13	Apr. 4
Calgary, Alta., supply of steel rails and gasoline truck	Apr. 12	Apr. 4
Leamington, Ont., construction of pavement	Apr. 15	Mar. 28
Victoria, B.C., fabrication and erection of part of superstructure of Johnson St. bridge	Apr. 17	Mar. 21
Kingsville, Ont., construction of reinforced concrete, base and stone filled asphalt, or base and bitulithic asphalt, etc.	Apr. 17	Apr. 4
York Tp., Ont., construction of six reinforced concrete culverts	Apr. 17	Apr. 4
Fort William, Ont., erection of school addition	Apr. 17	Apr. 4
Midland, Ont., sewer construction	Apr. 17	Apr. 4
Dunnville, Ont., supply of pumps, etc.	Apr. 17	Apr. 4
Halifax, N.S., gravel surfacing	Apr. 19	Apr. 4
Della, Alta., erection of schoolhouse	Apr. 20	Apr. 4
Halifax, N.S., highway construction	Apr. 20, 22, 24 & 26 Apr.	4

BRIDGES, ROADS AND STREETS

Belwood, Ont.—Following contracts have been awarded by Wellington County Council in connection with the erection of a steel bridge: Steel work, A. Hill & Co., Mitchell, \$9,146; concrete floor, Chas. Mattini, Fergus, \$1,648; abutments, Quinn & Wilson, Fergus, \$4,700.

Brampton, Ont.—William Treadgold, Town Engineer, submitted plans of proposed improvements to Main St. south, to Town Council. The improvements include the widening of the roadway, the erection of a new bridge over the Etobicoke, and construction of retaining walls. Estimated cost, \$33,000.

Bridgeburg, Ont.—Welland County Council has decided to recommend the Garrison roadway site, in preference to the Walnut St. site at Fort Erie, as the Canadian end of the proposed bridge to be constructed by private capital. A bill is pending for this charter at Ottawa now.

Charlottetown, P.E.I.—Provincial Legislature passed a bill authorizing the Province to borrow \$450,000 for road building.

Fenelon Falls, Ont.—Town Council considering the construction of some permanent roadway. Clerk, E. Fitzgerald.

Ford City, Ont.—Concrete sidewalks will be laid this year on Arthur, Giles and Francois Streets, at a cost of \$15,000; concrete sidewalks on Drouillard Road, from the west side of Seminola St. to Tecumseh Road, and on the east

and west sides of Hickory St., from Seminola to Tecumseh Road, at a cost of \$8,000; and a concrete walk on part of the north side of Ottawa St. Clerk, J. F. Foster.

Fredericton, N.B.—City Council decided to grant the petition of M. E. Doohan for the opening up of Aberdeen St. extension through the property owned by Mr. Doohan, between Regent and St. John streets, and the installation of water and sewerage service on this street as soon as possible.

Galt, Ont.—City Council accepted following tenders for annual supplies: Cement, Galt Fuel & Supply Co.; sand and gravel, C. E. Winter; castings, Galt Foundry Co., Ltd.; road oil, Sun Co. of Canada, Ltd.

Guelph, Ont.—Wellington County Council decided to proceed with the construction of the following bridges: Arthur St. bridge at Harrison, a 50-ft. span structure estimated to cost \$6,000; the red bridge at Drayton, 8-ft. span, at a cost of \$10,000; and the Damascus bridge in West Luther, at a cost of \$1,500. All structures are to be of concrete. Council is considering erection of bridges at Mount Forest and Pilkington.

Halifax, N.S.—City Council voted \$151,000 for construction of pavements.

Halifax, N.S.—Contract for the construction of the Shelburne County Line-Woods Harbor Road was awarded to the Provincial Highways Board, the lowest tenderers. Tenders were also received from the following: Engineers & Contractors, Ltd., Nova Scotia Road Builders and Norman E. Smith, W. J. Stuart.

Hamilton, Ont.—Board of Control recommended the paving of Depew St.

Hamilton, Ont.—Civic Works Committee will consider paving of Burlington and Ottawa Streets.

Hamilton, Ont.—Works Committee decided to have Ottawa St. paved, from Beach Road to Burlington St.

Hamilton, Ont.—Road Superintendent T. R. Allison, of Wentworth County, is asking the County Council for approximately \$150,000 for work on the roads this year.

Kitchener, Ont.—Carl Daman, of Kitchener has been awarded contract by Provincial Highway Dept. for construction of two miles of 20-ft. pavement from Kitchener toward Freeport, and the Stewart Construction Co. contract for grading of the highway from Freeport to Preston.

Morton, Man.—Contract for grading roads awarded to Carter-Halls-Aldinger Co., Winnipeg. Total mileage, 27; price, 19½ cents per cu. yd.

Nelson B.C.—Council proposes to submit a road improvement by-law. Clerk, W. E. Wasson.

Niagara Falls, Ont.—The following tenders were received for municipal asphalt plant: Barber Asphalt Co., \$13,374.45; F. D. Cummer & Son Co., \$14,600; Hetherington & Berner, \$14,472; Dominion Industrial Products Co., Ltd., \$12,000; Sawyer-Massey Co., Ltd., \$15,995. All tenders were in Canadian funds, f.o.b. Niagara Falls, excepting that of the Dominion Industrial Products Co., Ltd., who bid on an Austin plant f.o.b. Toledo in U.S. funds.

Ontario, Province of.—Tenders will be received by W. A. McLean, Deputy Minister of Public Highways, until 12 o'clock noon, Thursday, May 11, for various work on the Provincial Highways. (See official adv.).

Ottawa, Ont.—Suburban Roads Commission awarded contract to the Standard Paving Co. for putting an asphalt surface on 3½ miles of the Richmond and Metcalfe roads.

Prince Edward Island, Province of.—Tenders for road

materials will be received until 12 o'clock noon, Friday, April 28, by L. B. McMillan, Secretary of Public Works, Charlottetown. (See official adv.).

Prince Edward Island, Province of.—Tenders for grading and concrete structures will be received by L. B. McMillan, Secretary of Public Works, Charlottetown, until noon, Friday, April 28. (See official adv.).

Orillia, Ont.—Contract for paving parts of Colborne, Neywash and Lacie Streets has been awarded to the Warren Bluminous Paving Co. of Ontario, Ltd., Toronto, for \$90,000.

Peterborough, Ont.—Paving of George St. south is planned. City Engineer, R. H. Parsons.

Port Credit, Ont.—The reconstruction of Brook St. is planned. Clerk, G. W. Gordon.

St. John, N.B.—Council awarded contract to J. E. & P. D. Connolly, Bathurst, N.B., for construction of 1,464 ft. of granite curbing, at \$1.33.

St. Thomas, Ont.—Construction of an entrance to the Athletic Park from Hiawatha St. is to be started this year, simultaneously with the commencement of excavating operations in the street which is to be paved with asphalt this year. City Engineer, W. C. Miller.

Sandwich, Ont.—Essex County Council plans to expend \$577,715 on improving the county roads this year. Road Superintendent, W. H. Kinster, Sandwich.

Toronto, Ont.—City Council will improve Jane St. subway at Lambton Park.

Toronto, Ont.—Proposed extension of Riverdale Ave. was approved by City Council.

Toronto, Ont.—City Council struck out proposed widening and paving of Parliament St.

Toronto, Ont.—City Council gave third reading to by-law for extension of Dundas St. across Yonge St.

Toronto, Ont.—Works Committee considering the opening of a lane in a southerly direction from College St., between Ossington Ave. and Roxton Road.

Toronto, Ont.—City Council sent back to the Board of Control the proposed widening of Bloor St., from Sherbourne St. to Spadina Ave., and from Lansdowne Ave. to Dundas St.

Toronto, Ont.—Tenders addressed to C. Alfred Maguire (Mayor), Chairman, Board of Control, will be received until noon, Wednesday, April 19 for the construction of asphalt pavements, bitulithic pavements, concrete pavements, concrete curbs and concrete sidewalks on a number of streets.

Unionville, Ont.—Markham Township Council has decided to call for tenders for opening up the Markham-Whitchurch town line, from the third concession to Yonge St., at an estimated cost of \$20,000.

Victoria, B.C.—The road construction program this year of the Provincial Highway Department includes the following work: the completion of the Revelstoke-west road, three miles, \$18,000; Arrowhead north road, \$38,000; completion of the Cascade-Rossland road, 19 miles, \$250,000; and the first section of the Nelson-Ymir road between Rosebud and Boundary, tenders to be called May 1. The work contemplated includes Moyle lake road near Cranbrook and macadamizing and completing main Creston highway. Minister of Public Works, Hon. H. H. Sutherland.

Waterloo, Ont.—L. F. Dietrich, chairman of the Board of Works, recommended to the Town Council the paving of Union, John and Allan Streets, from King to Hillow Streets; Mary St., between Union and Allan Streets; and Erb St., between Pepper and Moore Ave.

Welland, Ont.—Welland County Council will spend more than half a million dollars on roads this year, \$640,000 on construction and \$100,000 on maintenance and repairs. Road Superintendent, W. W. Brookfield, Box 1334, Welland.

Windsor, Ont.—City Council intends to construct a concrete pavement on Louis Ave., from Tuscarora St. to Niagara St., at an estimated cost of \$10,807. City Clerk, M. A. Dickinson.

Winnipeg, Man.—City Council intends to construct

granolithic sidewalks on a large number of streets. City Clerk, C. J. Brown.

York Tp., Ont.—Plans for the widening of Scarlett road to 86 ft., both in Etobicoke and York Township, are completed. Work will commence early in the summer. Toronto and York Roads Commission will likely pave the road next year.

WATER, SEWAGE AND REFUSE

Guelph, Ont.—City Council will consider the construction of another trunk sewer from Wellington St. to the average farm. City Engineer, F. McArthur.

Halifax, N.S.—City Council voted the sum of \$150,000 for sewer construction.

Hamilton, Ont.—A special committee of the city council is considering the qualifications of various firms of consulting engineers, with a view to appointing an expert to advise the city in regard to sewage disposal. At a meeting of the committee held on March 24, E. M. Proctor, of James, Proctor & Redfern, Ltd., Toronto, and Wm. Storrie, of Gore, Nasmith & Storrie, Toronto, addressed the aldermen, outlining the experience that the members of their firms have had in sewage-disposal matters. At a later session, Willis Chipman, of Chipman & Power, Toronto, met the committee. Two American engineers, Langdon Pearse, of Chicago, and Harrison P. Eddy, of Boston, are also being considered by the commission.

Newmarket, Ont.—Town Council decided to have sewers constructed in Millard Ave. and Tecumseh St., at a cost of about \$5,000.

North Bay, Ont.—Town Council passed a by-law authorizing the construction of sanitary sewers on Wyld St., between Second Ave. and Worthington St., and on First Ave., between Ferguson St. and Wyld St. Approximate cost, \$17,000. Work will be done by Town Engineer, F. G. Mackie.

Ottawa, Ont.—Contract for construction of Ralph St. sewer awarded by City Council to McLaughlin Bros., for \$6,793. Vitrified pipe is to be used. O'Leary's Ltd., tendered at \$8,325.08, and the city engineer at \$10,315.86.

Ottawa, Ont.—Tenders, addressed to the Board of Control, City Hall, for cement concrete pipe or vitrified clay sewer pipe, will be received until 12 o'clock noon, Tuesday, April 11. Specifications may be obtained at office of City Engineer.

Peterboro, Ont.—City Engineer R. H. Parsons will prepare plans for a new sewer in Romaine St.

Peterborough, Ont.—City will construct the new sewage disposal plant this year at an approximate cost of \$230,000. City Engineer, R. H. Parsons.

Moncton, N.B.—Board of Works recommended that tenders be called for from 20 to 25 catch basins.

Port Credit, Ont.—Work on the proposed water works will be rushed, following the final surveys. Approval of the Provincial Board of Health has been secured.

Scarboro' Bluffs, Ont.—Petitions urging extension of the Scarboro' water system into this area were largely signed at a recent meeting of the Ratepayers' Association.

Toronto, Ont.—The Margueretta St. sewer will be reconstructed at a cost of \$67,950.

Toronto, Ont.—Contract awarded to the Grant Contracting Co., Ltd., 50 Front St., Toronto, for the laying and jointing of water pipes in Bedford Park Ave., Brookdale Ave., Cranbrook Ave., Jedburgh Road, Deloraine Ave. and Lawrence Ave. West, for a total of \$1,106.25.

Walkerville, Ont.—The town of Walkerville has awarded a contract to the Canadian Incinerator & Furnace Co., Ltd., Toronto, to install an up-to-date incinerator with force draft and oil burning equipment complete, this to take the place of their existing furnace which has been in use for some years, using gas as fuel to destroy their garbage. Under ordinary conditions the new incinerator will burn the garbage without added fuel, as is being done at Windsor, Kitchener, Fort William and Transcona, where the company have plants in operation.

York Tp., Ont.—Scarboro Township has offered to supply water to the eastern part of York Tp. The matter was referred to Engineer R. O. Wynne-Roberts.

LIGHT, HEAT AND POWER

Lachine, Que.—City Council will shortly call for tenders for the construction of a transmission plant.

Ontario, Province of.—Sir Adam Beck, chairman of the Hydro-Electric Power Commission of Ontario, announced that the commission has prepared plans, which will be carried out either this year or in 1923, for the construction of a direct high tension steel tower line from the Chippawa plant to St. Thomas.

Orillia, Ont.—By-law to provide \$30,000 by debentures for an extension of the water works system was decided upon recently. Clerk, C. E. Grant.

Oshawa, Ont.—Bell Telephone Co. will spend \$31,000 this summer on the construction of new underground and aerial cables.

Ottawa, Ont.—Ottawa Hydro-Electric Commission awarded following tenders for supplies: Meters, Ferranti Meter & Transformer Co.; globes, insulators and brackets, Canadian General Electric Co.; transformers, Canadian Crocker Wheeler; cross arm braces, solder, junction boxes and covers, cutouts, W. L. Donnelly Electrical Supplies; fuses and conduit, Northern Electric Co.; wire, Garrioch Godard & Co.

Quebec, Que.—A gigantic power scheme involving a capitalization of \$500,000,000 is being mooted here, and parties connected with the project have approached leading business men, including Major Samson, of this city. The mayor was informed that American interests are behind the scheme, who, it was stated, were planning the acquisition of the Quebec Railway, Light, Heat and Power Co. together with the rights to all water powers north of Quebec, with a view to developing enough horsepower to serve the whole province and large sections of the United States. Mayor Samson has declared himself in favor of the scheme.

Windsor, Ont.—Estimating that the total loss incurred by people of the Border Cities, through the two failures of Hydro-electric power which have occurred this winter, must be in the neighborhood of \$500,000, Ald. E. Blake Winter announced that if the scheme appealed to his colleagues in the City Council, he would initiate a movement to secure an auxiliary steam plant which would ensure the border of an unending supply of electricity.

RAILWAYS

Osprey, Ont.—Township Council is agitating for the extension of the C.P.R. line from Saugeen Junction to Osprey and Collingwood Townships.

St. Thomas, Ont.—Contract for laying several miles of rails on the Michigan Central division this year has been awarded to the Hall Construction Co.

Toronto, Ont.—The report on the proposed electrification of the T. & N. O. Railway will soon be submitted to the Ontario Government.

Toronto, Ont.—City Council approved debenture issue of \$10,000,000 for Transportation Commission's reconstruction program and extensions.

Toronto, Ont.—C.P.R. proposes to construct another siding across John St. to serve the premises of J. K. McLaughlin, 275 King St. West.

Windsor, Ont.—C.P.R. plans to spend \$250,000 in Windsor for the improvement of facilities. F. M. Rutter, superintendent of the London division, will award the contract within a few days for the new freight sheds here and the opening of new yards.

FACTORIES AND LARGE BUILDINGS

Athens, Ont.—Tenders for a High School, addressed to the Secretary, High School Board, Athens, will be received

until noon, April 15. Plans and specifications may be seen at the office of the architect, A. Stuart Allaster, Brockville.

Atikokan, Ont.—The following tenders were received for the erection of a two-room Public School building: John East Co., Port Frances, \$17,430; Russell Bros., Fort William, \$18,472; Wyatt-Ireland Ltd., Winnipeg, \$18,603; Thunder Bay Harbor Improvement Co., Port Arthur, \$19,340.81; Street & Holley, Fort William, \$20,921.

Aurora, Ont.—A large addition will be built this year to Aurora High School.

Bolton, Ont.—Town Council plans erection of new Town Hall. Clerk, F. E. Snider.

Britannia Beach, B.C.—Plans for the rebuilding of the town which was destroyed by floods last year, and for rushing the completion of the new, \$800,000 fire-proof concentrator, are being made by N. J. Quigley, vice-president of the Britannia Beach Mining Co.

Brockville, Ont.—Rebuilding of the Athens High School, destroyed by fire, has been decided on, and work will be proceeded with shortly.

Brooklin, Ont.—Erection of a consolidated school is projected.

Calgary, Alta.—A new Crescent Heights Methodist Church will be erected at an initial expenditure of \$12,000. Work will commence about June 1. Address F. E. Graham.

Charlottetown, P.E.I.—Fire destroyed the warehouse of Imperial Oil, Lt., near here. Loss, \$15,000.

Courtright, Ont.—Diamond Crystal Salt Co. of St. Clair, Mich., plan to erect a salt refining plant here at a cost of \$50,000.

Dorchester, Ont.—Plans are under way for the building of a continuation school.

Dundas, Ont.—By-law will be submitted to ratepayers to loan \$15,000 to F. P. Thornton to aid in the erection of a plant.

Edmonton, Alta.—Mayfair Gold and Country Club plan erection of clubhouse. The contracts, which will be let shortly, include the installation of a complete water system for the golf course. Architect, Frank Lansdown.

Elmira, Ont.—Local I.O.O.F. plan construction of building. Tenders are now being called.

Essondale, B.C.—Contract for the erection of Acute Building at Mental Hospital has been let to McDougall-McNeill Co., Ltd., Vancouver. Estimated cost of building when completed, \$600,000.

Galt, Ont.—Enlargement of the Agricultural Hall at Dickson Park is projected.

Galt, Ont.—School Board asked City Council for \$10,000 for remodeling Victoria School.

Galt, Ont.—Ratepayers endorsed the project of an industrial loan to a Toronto woodworking firm which proposes to construct a plant here.

Grant Mine, B.C.—Tenders will be received by Hon. Dr. W. H. Sutherland, Minister of Public Works, Victoria, until 12 o'clock noon, Friday, April 12, for the erection of a two-room school at Grant Mine, in the Newcastle Electoral District, B.C. Plans and specifications may be seen at the offices of the following: J. Mahony, Government Agent, Court House, Vancouver; S. McE. Smith, Government Agent, Court House, Nanaimo; J. S. Peterson, Secretary to School Board, R. R. 1, Wellington; or the Department of Public Works, Victoria.

Hamilton, Ont.—Permit issued to Stuart & Sinclair for addition to factory of the Hamilton Cotton Co., costing \$18,000.

Hamilton, Ont.—Parks Board plans construction of three new sections to grandstand at Scott Park. Chairman, Alfred Wright.

Hamilton, Ont.—Board of Control has favored plans of the hospital governors and officials of the Babies' Dispensary Guild to erect a building on the city hospital grounds to house the outdoor clinics and the dispensary. Estimated cost, \$60,000.

Hussar, Alta.—Tenders will be received until noon, April 15, by Frank J. Harper, Secretary-Treasurer, Crammond S. D. No. 3988, for the erection of a school.

Ivry, Que.—Fire destroyed the Manitou Clubhouse, at Lake Manitou, near here. Estimated loss, between \$30,000 and \$40,000.

Kerrisdale, B.C.—Contract for erection of fire hall awarded to Baynes & Howe, Howe St., Vancouver.

Kingston, Ont.—Work on the erection of a new library building for Queen's University will be started next fall. Estimated cost, \$350,000.

Kitchener, Ont.—Tenders for the various trades in connection with the erection of a laundry building for the Waterloo County House of Refuge, will be received until Saturday, April 15. Plans, specifications, etc., on application to H. W. Martin Manager, or to the architect, W. C. Cowan.

Lindsay Ont.—Board of Education plans addition to Collegiate Institute at an approximate cost of \$60,000.

Moncton, N. B.—Alderman Ambrose Wheeler has received a contract from Carl Doull for the erection of a three-storey, brick faced, terra-cotta building on Robinson St. Estimated cost, \$10,000.

Montreal, Que.—Church of the Sacred Heart, corner Plessis and Ontario Streets, was completely destroyed by fire. Loss, between \$400,000 and \$500,000.

Montreal, Que.—Tenders for the demolition of Knox Church are being called. The Sun Life Assurance Co. will erect a large addition to their present building on this site.

Niagara Falls, Ont.—Tenders close April 12 at 6 p.m. for erection of Hydro transformer station for the Municipal Hydro Commission. Plans and specifications at office of C. M. Porter, 102 Main St.

North Bay, Ont.—Town Council authorized Public School Board to proceed with an addition to the McPhail Street school, at a cost of \$47,000.

Orillia, Ont.—Work has started on the erection of new buildings for the Fisher Motor Co. and the Canada Electric Castings Co., Ltd.

Oshawa, Ont.—Work on the proposed new St. George's Anglican Church will be commenced immediately. Tenders for the excavation have been called. Estimated cost, \$100,000.

Ottawa, Ont.—Work has started on the erection of a garage on the south-east corner of Bank and Catharine Streets for the Beach Motors, Ltd. Approximate cost, \$100,000.

Ottawa, Ont.—Tenders will be received until 6 o'clock, Monday, April 17, by D. Monroe, Sec.-Treas., Board of Public School Trustees, for the erection of a school building. Tenders may be submitted for the complete building, or for the different trades, viz: Plumbing, plastering, carpentry, foundation work etc. Plans and specifications may be obtained at the office of the secretary-treasurer; at the office of Millson & Burgess, Architects, 209 Sparks St., Ottawa; or W. C. Beattie, Consulting Engineer, Ottawa.

Pembroke, Ont.—Separate and bulk tenders will be received until noon, May 9, for all trades required in the erection of Hospital for the Pembroke Cottage Hospital Association. Plans and specifications may be seen at the office of W. C. Keighley, Architect, Grand Trunk Building, Pembroke.

Preston, Ont.—School Board accepted plans of Architect Warren of Hamilton, for a 16-room school, to be erected in units as required, the first unit to be erected this year for which tenders will be called shortly.

Quebec, Que.—Plans have been asked for and tenders will likely be called for an extension to the Court House.

Raleigh Tps., Ont.—Contract for erection of brick school in S. S. No. 6 has been let to Art. Gallagher, general contractor, for \$10,900.

Renfrew, Ont.—Ratepayers authorized the Town Council to pass a by-law for the building of new Collegiate Institute at a cost of \$200,000.

Sarnia, Ont.—City Council passed by-law granting certain concessions to the Dominion Alloy Steel Corporation in return for which the company will erect a \$3,000,000 plant. By-law will be voted on by ratepayers on May 4.

Toronto, Ont.—Separate School Board plans erection of an 8-roomed school in Moore Park, and a 4-roomed addition to St. Vincent de Paul School. Chairman, D. A. Carey.

Toronto, Ont.—Members of the York Masonic Hall Co., Eglinton Ave. and Yonge St., are planning the construction of a large hall on their site on Eglinton Ave., just east of Yonge St., at a cost of \$100,000.

Toronto, Ont.—Tenders, addressed to Herbert E. Moore, Architect, 229 Yonge St., Toronto, will be received until 12 o'clock noon, Friday, April 14 for the erection of school building, Moore Park, for the Separate School Board.

Toronto, Ont.—Tenders will be received until April 24 by J. M. Cowan, Architect, 3 Carlton St. Toronto for an trades required in the erection of Church and Rectory Buildings for the Parish of St. Vincent de Paul, Roncesvalles Ave.

Toronto, Ont.—A requisition from the Toronto University to the Provincial Government for four new buildings, at a cost of \$1,500,000, has been received. This includes a new Forestry Building, Botany and Administration Buildings, a Woman's Building, and additions to the heating plants.

Toronto, Ont.—The erection of the following buildings on Bloor St. is projected: Westminster Presbyterian Church and Sunday School, \$250,000; Manufacturers' Life Insurance Co., \$500,000; Gibson Electric Co., \$20,000; Doctors' apartment, by Addison Johnston, \$225,000; Durant Motors showroom, \$100,000; James Wood, corner of Bellair, \$25,000; Burroughes Furniture Co., \$250,000; Home Bank, \$150,000; and Provincial Museum, \$1,000,000.

Toronto, Ont.—Separate School Board accepted following tenders for erection of a 16-room school on north side of McDonnell Square: H. A. Wickett Co., masonry and cut stone, \$42,000; Thos. J. Sullivan, carpentry, \$28,189; Wm. J. McGuire Ltd., heating and plumbing, \$19,500; E. J. Curry, lathing and plastering, \$4,396; J. J. Glynn, sheet metal roofing and metal ceilings, \$4,930; T. J. O'Connor, painting and glazing, \$4,100; McGregor & McIntyre, structural steel, \$3,067; J. G. Gibson Granite Co. marble and terrazzo, \$4,386; Martin Nealon, electric wiring, \$830.

Vulcan Alta.—Erection of church is projected. Address T. B. Davenport.

Walkerville, Ont.—Permit issued to Bell Telephone Co., for the erection of exchange building, estimated to cost \$52,000.

Welland, Ont.—Universal Casket Co. plans erection of plant at estimated cost of \$40,000.

Wellington, Ont.—Contract for the interior finish for the new consolidated school has been awarded to the Belleville Sash and Door Co., Ltd.

Windsor, Ont.—Tenders are being called by the Board of Park Commissioners for the erection of a clubhouse at Wigle Park.

Windsor, Ont.—Members of Knox Presbyterian Church, London St. and McEwen Ave., contemplate the erection next September of a new church costing \$60,000.

Windsor, Ont.—Contract for construction of an addition to the transforming station has been awarded to Muslow & Gale Contracting Co., Masonic Temple, Windsor.

Winnipeg, Man.—Fire in the warehouse of Chelmskys's, Ltd., caused damage estimated at \$100,000.

Winnipeg, Man.—Work is expected to start next fall by the Canadian Foresters' Holding Association, Ltd., on the construction of a Foresters' Hall, estimated to cost \$300,000. President, A. H. Coppen.

Woodstock Ont.—Board of Management of Woodstock General Hospital plan erection of addition at cost of \$100,000.

Woodstock Ont.—Several continuation schools will be established in this district this year, including one at Hickson, one at Mount Elgin and one in Innorkip and in all probability one at Beachville and another at Embro.

York Tps., Ont.—Township Council authorized debenture issue amounting to \$21,000 for two-roomed school addition in S. S. No. 31.

MISCELLANEOUS

Alberta, Province of.—The following companies have been incorporated under provincial charters: St. Paul Electric Supply Co., Ltd., St. Paul des Metis, \$10,000; Mining and Industrial, Ltd., Calgary, \$20,000; Calgary-Edmonton Diamond Drill Contracting and Developing Co. Ltd., Calgary, \$20,000; Currey Chemical Co., Ltd., Calgary, \$50,000.

Chatham, Ont.—City Council will ask the Dominion Government for a grant to assist in repairing the McGregor Creek breakwater on the point at Tecumseh Park.

Cobourg, Ont.—Dominion Government voted \$21,000 for the construction of the breakwater here.

Hamilton, Ont.—The plan recently presented to Hon. J. H. King, minister of public works, Ottawa, by a delegation from Hamilton for harbor improvements here, will be approved by the minister, according to a dispatch received.

Lethbridge, Alta.—Contract for 875 cu. yds. of plain concrete to the construction of the masonry of the three principal railroad crossings of the Lethbridge Northern Irrigation District, has been awarded to Smith Bros. and Wilson, of Lethbridge, for \$18,918.

Miniota, Man.—Municipality has sold a bond issue amounting to \$9,000 for telephone purposes. Clerk, W. E. Warren.

Montreal, Que.—Sand and Gravel Products, Ltd., has been incorporated under Dominion charter, with head office in this city and capitalization of \$100,000. Walter A. Merrill is one of the directors.

New Westminster, B.C.—Provincial charter has been granted to Builders Supply, Ltd., of this city. Capitalization, \$10,000.

Ontario, Province of.—Following are the names of companies recently incorporated under provincial charters, with head office, capitalization and name of one director: Allen's Construction Co., Ltd., Windsor, \$40,000, David E. Allen; London Bridge Works, Ltd., London \$100,000 Richard G. Ivey; Mack Realty & Construction Co. Ltd., Windsor, \$50,000, Percy A. McKee.

Ontario, Province of.—The following are the names of companies recently incorporated under Provincial charters, with head office, capitalization and name of one director: Doran Construction Co., Ltd., Ottawa, \$100,000, Harold Fisher; Ontario Anthracite Mines, Ltd., Toronto, \$500,000, Richard G. McClelland; Rapid Building Construction Co., Ltd., Toronto, \$40,000, Benjamin Luxenburg; Woodhouse Crushed Stone Co., Ltd., Port Dover, \$40,000, John S. Martin.

Ottawa, Ont.—The following are the names of companies recently incorporated under Dominion charters, with head office, capitalization, and name of one director: Grant Brothers Construction Co., Ltd., Ottawa, \$200,000, Alan G. McDougall; Manganese and Steel Foundry, Ltd., Sherbrooke, \$25,000, Frederick S. Pugg; Northern Architectural Iron Works (Montreal) Ltd., Montreal, \$40,000, John G. Frost; La Compagnie Electrique de Rockland, Ltd., Rockland, \$100,000, Andrew T. Thompson.

Quebec, Que.—City Council decided to extend the drainage system in Charlesbourg Road at an approximate cost of \$3,000.

Quebec, Province of.—Hochelaga Cement Co., Ltd., Montreal, has been incorporated under provincial charter. Capitalization, \$3,000,000. Jos. C. G. Contant is one of the directors.

Quebec, Que.—Hon. Ernest Lapointe, minister of Marine and Fisheries in the Dominion Government, intends to introduce in the House a resolution providing for the advance of sums not exceeding \$1,500,000 for the improvement of terminal facilities at Quebec harbor.

Quebec, Province of.—Following are names of companies recently incorporated under Provincial charters, with head office, capitalization and name of one director: Lake St. John Light & Power Co., Montreal, \$250,000, John A. Mann; Vaughn Construction Co., Ltd., Montreal, \$20,000, John Vaughn.

St. Catharines, Ont.—The cost-plus system which has been in force on Section 3 of the Welland Ship Canal since the war is to be abandoned for the contract system now used on the other section of the canal. Inventory is now being taken on Section 3, and when it is concluded all work on the section will cease and tenders will be called for.

Sherbrooke, Que.—Four by-laws calling for an expenditure of \$445,000 for road improvements, construction of sidewalks, sewers and a bridge over the Magog River on Dufferin Ave. were passed by the ratepayers.

Sydney, N.S.—Contract let to Clarke Foundry Co. by the Cape Breton Electric Co. for construction of new steel smoke stack at the company's power plant on Townsend St.

Toronto, Ont.—Harbor Commissioners awarded contract for concessions at Sunnyside to Archibald & Holmes as general contractors.

Toronto, Ont.—City Council applied for legislation to issue debentures for \$2,000,000 for relief sewers, water main extensions, St. Clair bridge and arena heating.

Toronto, Ont.—Parks Department is preparing to make extensive improvements to Earlscourt Park. It is understood that \$10,000 will be spent in grading, erecting club houses, etc.

Toronto, Ont.—The work of widening Yonge St. from Hogg's Hollow to Holland Landing, will likely be commenced this summer. At the same time the whole stretch of the road will be repaved.

Toronto, Ont.—A large delegation, headed by Mayor Maguire, waited on Premier King and members of the cabinet, at Ottawa, recently, and made a strong appeal for the immediate construction of the viaduct in this city.

Toronto, Ont.—In connection with the Toronto Harbour improvement work, Roger Miller & Sons, Ltd., have the contract for the construction of the breakwater from Dowling Ave. to the Humber, and the Randolph Macdonald Co. contract for the construction of breakwater on the lake side of the Island, east of Manitou Road.

Toronto, Ont.—Works Commissioner Harris was instructed by the Board of Control to decide upon what local improvements are to be cut out in order to bring down to \$3,000,000 the \$3,729,955 program passed by the Works Committee. City Council agreed that works costing only \$3,000,000 would be carried out this year.

Vancouver, B.C.—P. B. Mottley, bridge engineer for the Canadian Pacific Railway western lines, has gone to Montreal to submit final details on the plans for the proposed new C.P.R. pier to be erected at Coal Harbor. It is expected that tenders will shortly be called.

Waterloo, Ont.—Waterloo Light Commission placed an order with the Northern Electric Co. for a fire-alarm system.

There was a big attendance at the annual banquet of the Chatham Builders' Exchange, which was held in the Chamber of Commerce, Chatham, Ont., March 21. The speeches of the evening were given by President Gibbs, of the Provincial Builders' Exchange, Sarnia, and Provincial Secretary Gander, of Toronto. Both of the speakers stated that while the building trades had suffered as a result of the war, the prospects for the present year are very bright and they expected that it would not be long before the country was back to normalcy in the building line.

The contract for rebuilding Louvain University Library, Paris, France, has been awarded to the Foundation Co., New York, who will immediately begin to assemble the necessary plant and materials for active work. This is one of the most important single pieces of reconstruction yet decided upon in the devastated area. It will represent the contributions of approximately one million American students and will be an expression of American interest in the restoration of Belgium. The cost of the reconstruction is to be met by a contribution of one dollar per capita from all of the undergraduate students in the various colleges and universities in the United States.

Tenders Called For

TOWNSHIP OF YORK

TENDERS FOR CONCRETE CULVERTS

Sealed tenders, plainly marked as to contents, will be received by the undersigned up to 10 o'clock, a.m. of Monday, April 17, 1922, for the construction of six Reinforced Concrete Culverts in the Township of York.

Plans and specifications may be seen at the office of the undersigned, 40 Jarvis Street, Toronto.

The lowest or any tender not necessarily accepted.

FRANK BARBER,
Township Engineer.

FRANK BARBER AND ASSOCIATES, LTD.,
Consulting Engineers,
40 Jarvis Street, Toronto, Ont
Toronto, April 1, 1922. 273

TENDERS FOR HIGHWAY CONSTRUCTION

Sealed Tenders, addressed to the Provincial Highway Board, Halifax, Nova Scotia, will be received up to noon on the dates below mentioned, for the construction of the following roads:

- (1) Salem Church, Alma, to Fisher's Corner, Gravel Road, 10.05 miles. Tenders to be in April 20.
- (2) Liverpool Town Line to Mill Village, Gravel Road, 8.77 miles. Tenders to be in April 22.
- (3) From a point one mile east Victoria Bridge, Bear River, to a point 2.9 miles west of same. Gravel Road, 3.9 miles. Tenders to be in April 22.
- (4) Guysboro-Antigonish Co. Line to a point 8.85 miles south towards Guysboro. Gravel road, 8.85 miles. Tenders to be in April 24.
- (5) Pictou-Antigonish County Line to Antigonish Town Line. Gravel Road, 10.2 miles. Tenders to be in April 26.

Plans and specifications governing such work may be inspected at the office of the Highways Board, Halifax, N.S., on and after the following dates:

- No. (1) April 1.
- No. (2) April 5.
- No. (3) April 6.
- No. (4) April 7.
- No. (5) April 11.

Each tender for the work must be on the regular form which may be obtained at the Office of the Highways Board, Halifax, and must be accompanied by an accepted Bank cheque equal to ten per cent (10%) of the amount of the Tender. No interest will be paid on this deposit while it is held by the Board. Should the bidder to whom the contract is awarded, refuse to enter into a contract with the Highways Board within five (5) days after the notice of such award, the amount of such cheque may be forfeited to the Highways Board.

The lowest or any tender will not necessarily be accepted.

W. A. HENDRY,
Chief Engineer,
Provincial Highways Board,
Nova Scotia.—274

PLANT FOR SALE

Shovels:—

- 3—225-B Bucyrus Electric
- 1—225-B Bucyrus steam
- 1—Model 300 Marion steam
- 3—103-C Bucyrus electric
- 1—C-45 Atlantic steam
- 1—Model 60 Marion steam

Air Dump Cars.

Steam Locomotives—18 ton to 57 ton.

Electric Locomotives — 50 tons, 600 volt.

Spreader Plows.

"Industrial Works" Cranes —15 and 40 ton.

Wrecking Crane—75 ton.

Hoists—electric and steam.

Derricks.

Stone Channelers— Duplex, air driven.

Rock Drills — submarine type.

Tripod Drills and Jackman-mers.

Drill Sharpeners.

Air Tools—Miscellaneous.

Drill Steel.

Conveyors and Elevators.

Boilers—locomotive type.

Air Compressors—1100 ft. capacity, motor driven.

Centrifugal Pumps.

Steam Pumps.

Concrete Towers and Equipment—Insley, Lakewood and Ransome.

Steel Forms.

Concrete Mixers—electric driven, 1-yard capacity.

Automobile Trucks.

Motors—25 cycle up to 200 H.P.

Transformers—25 cycle.

Rails, Switches, Frogs and Ties.

10-lever Electric-pneumatic Interlocking Plant.

Poles—cedar.

Piling—fir.

Trolley wire.

Structural Steel.

Timber.

Blocks—rope and chain.

Miscellaneous small tools and Contractors' Equipment.

This plant has been used on the power development at Niagara Falls and is in good condition, some items being almost new. Any item of plant can be completely overhauled and repaired on the ground if required.

Address all inquiries to the Hydro-Electric Power Commission, 190 University Avenue, Toronto, or to Box 245, Niagara Falls, Ontario. —272

CORPORATION OF THE CITY OF VICTORIA, B.C.

JOHNSON STREET BRIDGE CONTRACT NO. 3

Sealed tenders addressed to the City Clerk for the fabrication and erection of part of the superstructure of the above, consisting of a Strauss Basculer span with plate girder approaches, will be received up to 4 p.m. on April 17, 1922.

Plans and specifications may be obtained from the City Engineer by depositing the sum of fifteen dollars (\$15.00), which will be refunded upon the return of the plans and specifications in good condition.

The lowest or any tender will not necessarily be accepted.

E. S. MICHELL,
Purchasing Agent.—277

TENDERS FOR HIGHWAY CONSTRUCTION

Sealed Tenders, addressed to the Provincial Highways Board, Halifax, Nova Scotia, will be received up to noon on the dates below mentioned, for the construction of the following roads:

- (1) KENZIEVILLE-PICTOU-ANTAGONISH COUNTY LINE Gravel Road, 7.84 miles. Tenders to be in April 12, 1922.
- (2) SABLE RIVER-LOCKEPORT. Gravel Road, from Tom Tidney Bridge to Walls' Corner, 8.04 miles.
- (3) HEHRON-MAITLAND. Gravel Road, from a point 1.7 miles North of Yarmouth Town Line, Station 90 to Maitland School House Station 500. 7.77 miles. Tenders for Nos. 2 and 3 to be in April 15, 1922.
- (4) BIG BRAS D'OR-ROSS' FERRY. Gravel Road, 10 ml.
- (5) STEWIAKE TOWN LINE-THRUO TOWN LINE. Gravel Road, approximately 15 miles. Tenders for Nos. 4 and 5 to be in April 18, 1922.

The Canadian Engineer

A Weekly Paper for Civil Engineers and Contractors

Toronto Highway Entrance Bridges, at Hamilton

Two Plate Girder Viaducts Built Over Railway Tracks by City — Alternative Entrance Projects — Three Other Bridges Built by Provincial Highway Department — Girders Protected from Corrosion by Guniting

By E. BLAKE ALLAN

City Engineer's Department, Hamilton, Ont.

AT THE close of the year 1919 the Toronto-Hamilton highway was still uncompleted. The Hamilton entrance presented a problem of major importance for three reasons. First, because the present road by way of the Valley Inn hill from the Plains Road to the level of the bay and up again to the summit of the tongue of land on which York Street is built, passing under the Grand Trunk Railway on the way, was becoming increasingly dangerous and costly of up-keep. Second, any remedy for the existing evil must necessarily be a very expensive one. Third, the possibilities of the future development as a park of a spot, which is by nature beautiful, should not be hindered by the erection of any unsightly structure, even to complete a link in our first improved national highway. The problem, then,

consideration, probably because of its relative cheapness in first cost.

Plan B. A fill to be made in conjunction with the C.N.R. over their right-of-way was proposed, but was not considered seriously for long, as the objections were very obvious, and the scheme offered no improvement on Plan A. The proposal was contingent on the construction of the C.N.R. into Hamilton.

Plan C. Another proposal was a bridge, over half a mile in length, to connect what is known as Carrol's Point to York St. just south of the high level bridge. A very desirable feature of this plan was the practically level grade thus obtained from the point at which the concrete at present ends on the Plains Road to York Street. But it would

FIG. 1—REINFORCED CONCRETE DESIGN FOR BRIDGE CROSSING. PLAN D

appeared to be to combine beauty and economy with usefulness, and to evolve the solution without undue delay.

Alternative Schemes

A report of the city engineer, dated April 5, 1920, to the Board of Control of Hamilton urged careful consideration of the problem and outlined various proposals. The approximate centre lines of these schemes are shown in Fig. 3. Their principal characteristics were as follows:

Plan A. The Armstrong hill was to connect what is known as the Hair Pin Turn on the east shore of the inlet to the subway under the Grand Trunk Railway on the west. The road on top was to be 30 ft. wide and 35 ft. above water level. The estimated amount of earth required was 135,000 cu. yd., at a cost probably between \$200,000 and \$300,000. The approaches would have been on 4% grades, the stability of the fill uncertain for several years, the whole structure no addition to the beauty of the spot, and the subway under the Grand Trunk Railway, one of the most unsightly and dangerous features of the old road, would have remained. This suggestion was given a good deal of con-

sideration, probably because of its relative cheapness in first cost.

also have included a road diversion of about half a mile to reach the north end of the bridge at Carrol's Point, and this with a total estimated cost of 1½ million dollars, caused the scheme to be rejected.

Plan D. The McKay plan was a high level bridge with centre line approximately on the centre line of the present fill and small bridge carrying the road at the Valley Inn. The eastern approach was a road diversion along the much debated road allowance between East and West Flamboro; and the western approach was along another old road allowance passing the Hamilton Sand and Gravel Co.'s plant, joining up with York St. just south of the present wooden bridge over the London "Y." In common with the line finally adopted, this plan included the erection of two small steel bridges over the arms of the above mentioned "Y."

Another part of the McKay proposal was, as a future development, to bring in the Waterdown and Guelph roads by a bridge on the site of the new Provincial bridge No. 3, meeting the Toronto highway where it would join the old road allowance north of the plant of the Hamilton Sand and Gravel Co.

This plan for the entrance had practically been accepted, and discussion appeared to centre around the relative advantages of concrete arches, as compared with steel arches; the cost in each case being about \$1,000,000. Illustra-

that the Grand Trunk Railway should pay the whole cost of bridge No. 4 and the city the whole cost of bridge No. 5. Thus, the total cost to the city of Hamilton for bridges will be in the neighborhood of \$450,000.

FIG. 2—STEEL DESIGN FOR BRIDGE CROSSING, PLAN D

tions of the two proposed designs are shown in Figs. 1 and 2.

Proposal Finally Adopted

At this point the route finally adopted was proposed by the provincial highway department. The line leaves the Plains Road not far from the end of the concrete, taking a direction about south-west crossing a ravine and marsh by a bridge 675 ft. long, a small bridge over the main line of the Grand Trunk Railway, then by a bridge 598 ft. long it crosses the old channel to Dundas west of the Valley Inn. So far, the route lay outside of the city limits and the provincial highway department agreed to look after the construction and expropriation of land necessary, the arrangement being that Hamilton should pay the share allotted later. Within the city limits the route was the same as that for the McKay plan and was to be constructed at the city's expense. As before stated, this included two small bridges over the two arms of the London "Y." As one of these was on an old road allowance, the Railway Board later ordered

Though the original idea was to build bridges with 40-ft. roadways, providing for a loading sufficient to carry heavy suburban radials and street cars, the final plans have excluded such a possibility and provide for a 30-ft. roadway. The provincial highway department began work on their bridges during 1920 while the city bridges were not started until the summer of 1921.

Characteristics of City Bridges

Altogether, there were five bridges to be built. They were numbered from the Toronto end, the provincial highway department building bridges Nos. 1, 2 and 3, while the city built Nos. 4 and 5. The present article will be confined to a description of the two latter. Nos. 4 and 5 differing in design only in minor details and their erection having

FIG. 3—ALTERNATIVE ENTRANCE SCHEMES OF TORONTO HIGHWAY INTO HAMILTON

gone on simultaneously, will be described as one undertaking except where occasion warrants special mention. Bridge No. 4 crosses the Grand Trunk double track line between Toronto and Detroit, and two sidings. Bridge No. 5 crosses a double track line of the Grand Trunk, though not quite

FIG. 4—FORMWORK CLOSELY FOLLOWING STEEL ERECTION, BRIDGE NO. 4

such a busy one as the other, and a single track line of the Canadian Pacific. Traffic was not delayed for a moment on any of these lines.

Design

As the contracts were not let until about September 1 it was necessary to expedite the work in every way possible to insure that, at least, the main part of the concrete would be laid before the frost came. Broadly speaking, the design was of a steel plate girder, floor beam and stringer type, supported by concrete abutments and piers with a reinforced concrete floor system. As the foundation material consisted of gravel held together with a very firm natural cement, no piling was considered necessary.

The abutments were reinforced throughout, but the piers were mass concrete. Because the road approached both cuttings at an angle, the abutments had wing walls on one side only, while the piers had to be placed in such a way that the main girders were not of equal lengths and the columns were not opposite each other. The minimum clearance in each case was $22\frac{1}{2}$ ft. from base of rail.

The main girders varied in length from 34 ft. to 66 ft. made up of plates $66\frac{1}{2}$ by $\frac{1}{2}$ in., with appropriate flange angles, cover plates, and stiffener angles. These girders were placed 32 ft. centre to centre. The floor beams were also plate girders with webs of $54\frac{1}{2}$ by $\frac{1}{2}$ in., placed centre to centre at distances varying from 12 ft. to 17 ft. to suit the lengths of the main girders. The stringers were 18 in. and 20 in. I-Beams spaced 4 ft. 6 in. centres. The columns in general consisted of special Bethlehem "H"-section 14 in. deep. The floor was a 9 in. slab reinforced concrete laid with a vertical curve from end to end. As the stringers were laid level this curve was obtained by building up a concrete beam along each stringer increasing in height from each end to the centre, the total difference of elevation being 6 in. There was also a drop of 4 in. between the crown of the road and the gutter. The sidewalks were supported by reinforced concrete beams cantilevered over the main girders about 12 ft. centres. The total floor length

was, for No. 4 bridge 208 ft.; and for No. 5, 201 ft.; the width for each being 30 ft. between curbs, with two 5-ft. concrete walks. Allowance was made for 3 in. of asphalt surface on the roadway.

The handrail was of reinforced concrete, so designed that the panels might be precast if desired. The panels were 4 in. thick by about 12 ft. long, having rectangular openings 6 in. by 24 in. spaced 5 in. apart. The panels in the sections on the wing walls of the abutments were solid. The top and bottom rails were 9 in. wide with posts, in general 9 in. by 12 in., by 4 ft. high. At each joint in the main girders an expansion joint of $\frac{3}{4}$ in. was left in the handrail. An expansion joint of 1 in. was provided at each end of the bridge between the concrete floor slab and the abutments. A steel angle 6 by 6 in. by 30 ft. long bent to the camber on the road, carrying lugs to be buried in the concrete protected the concrete of the abutments from chipping on one side of the joint while a similar one protected the concrete of the road slab on the other. The space left was to be filled with some elastic material.

The original design brought the handrails to the abutment only, on one side, and to the end of the wing wall on the other, thus making them uneven in length. Before the contracts were let, this was changed by order of the city engineer so that they were finally built of equal length. The additional piece of rail was supported by a small wall going just below the frost line.

No provision was made in the design for illumination. Gunitite was specified instead of paint as a preservative coating for the steel work, and an extra load of 2,500 lb. per lineal foot of bridge was allowed to provide for its extra weight. This is said to be an innovation in bridge construction in Canada, though often used in the United States. Gunitite was used in this case in order to protect the steel from the deleterious gases of the locomotives passing beneath, with the object of lengthening the life of the bridges.

Contracts and Specifications

Tenders were called for to include the whole job or any distinct part of it such as the concrete, the steel work or the gunitite. In an attempt to expedite the completion of the work, time and co-operation clauses were introduced, night work was enjoined where ever possible, and the work on the two bridges was to proceed simultaneously. A special clause regarding labor set the wage for unskilled men at 50 cents per hour, and skilled men at the union rate.

So far as the main part of the concrete was concerned,

FIG. 5—BRIDGE NO. 4 GUNITED—NOTE FORMS FOR GUNITITE AND HANDRAIL.

the time clause made it imperative that the contractor should have a very large equipment. Fortunately, successful bidders were well situated in this regard.

Only steel made by the open hearth process was to be used as reinforcing. The handrail was to be finished

with a facing of $1\frac{1}{2}$ in. of gray granite chips ranging in size from $\frac{1}{4}$ in. to $\frac{3}{4}$ in. The surface was to be rubbed up with a medium wire brush to bring the granite chips into relief and finally it was to be given an acid wash.

FIG. 6—GUNTING MAIN GIRDERS, BRIDGE NO. 4

Special clauses concerning gunite will be found later under the heading of "Gunite."

Removal of Old Bridge

Part of the contract for the steel work consisted in the removal of the old bridge on the site of bridge No. 4 and its temporary erection again where it would be out of the way of the new work, but would carry the traffic which formerly used it, for the time being. This old bridge consisted of two steel girder spans of about 50 ft. each, supported on wooden bents, having a wooden plank floor, and wooden approaches at each end.

On Aug. 15 the contract for the steel work was let and the bridge company arrived on the ground on Aug. 18. A clause regarding the old bridge stated that traffic must be held up for only 36 hours of two nights and one day. Thus it was necessary to prepare the approaches first and leave only what work was absolutely necessary for the 36 hours specified. On Sept. 2 they had two derrick cars on hand and began the removal of the bridge. Traffic was only held up for 57 hours.

Concrete and Excavation

The contract for the concrete and excavation was let Sept. 6, and the Russell Construction Co. began work on Sept. 12 on both bridges. As the engineers had been on the job for a month before and the whole work was staked out and ready, a big force was able to set to work at once and thereafter the work went on for about 18 hours a day till the completion of this contract. The contractor had 21 days to complete the abutments and piers and was able to strip all but the south abutment of bridge No. 5, within that time.

This delay was caused by circumstances over which the contractor had no control. Such rapid construction could only have been accomplished by a contractor with a big equipment. For part of the time there were 4 mixers and 4 derricks in operation, and 50 men at work. At night, search lights and strings of large size electric bulbs were used, and everything done to make the work move along with a swing. In the excavation for the south abutment of bridge No. 5 dynamite had to be used continually, because of the natural cement in the gravel. Water-tightness was insured at the construction joints in the concrete of the abutments above ground line by the insertion of sheets of metal set vertically.

Erection of Steel

On Oct. 11 the bridge company began erection of steel on bridge No. 4. By Oct. 20 the erection was complete, everything fitting nicely into place. One thing which ensured this was the proposal from the bridge company that bolts should not be put into the bridge seats till after the girders were in place, at which time they would themselves drill the holes in the concrete and set the bolts.

On Oct. 20 the steel contractor began the erection of steel on bridge No. 5, and drove the last rivet on Oct. 27. The good time made by the erection gang was rather remarkable when one considers that for about one-third of the time the derrick had to be running about dodging trains.

Road Slabs and Sidewalks

Before the riveters had reached the centre of bridge No. 4 the carpenters of the Russell Construction Co. were hanging the forms for the sidewalks over the sides of the main girders. This is well shown in Fig. 4.

The device used to support the form for the curb in order to allow the sidewalk and floor slab to be poured at the same time is perhaps worthy of note. Small blocks 3 by 3 by 2 in. were made of concrete, having round iron rods sticking up just far enough to hold up the curb form to its proper height while embedded 2 in. deep in the wood. These blocks were set up every 4 ft. along the curb line on boards forming the form work for the floor, and the curb form placed on the top of the short pieces of iron rods. The gutter was laid later when this curb form was removed. This scheme enabled the road and sidewalks to be poured as a monolithic slab. No construction joints other than those in a transverse direction straight across the bridge were allowed. The reinforcing was in the shape of

FIG. 7—ERECTION OF BRIDGE NO. 5 ALMOST COMPLETED

rods laid from side to side of the bridge held in place by smaller rods running parallel to the centre of the road. Every rod was well wired into place. In the placing of these rods one might observe the wisdom of the old saying, "More haste less speed." The concrete of the floor slab was

poured as nearly continuously as possible, the work going on night and day with a mixer at each end of the bridge. The gutters were finished just in advance of the frost.

Handrail

The panels of the handrail were in process of being precast in the plant of the Concrete Pipe and Products Co. near by, while the other work was going on. The first plan was to use red granite chips as a finishing coat, but gray granite was finally decided upon as more in keeping with the appearance of the rest of the bridge. The rubbing up of the panels was left till they were put in place on the bridge.

As soon as the sidewalk would bear it, the contractor began to work on the lower rail and pushed it along as fast as weather conditions permitted. The work only reached the stage of the completion of the lower rail when cold weather prevented further operations. The city engineer therefore ordered the work to be closed down for the season. The uncertainty of the setting because of frost made the rubbing up difficult.

Guniting

Special provisions for the application of gunite were: Sand to be no larger than $\frac{1}{4}$ in. mesh; mixture 1 part of cement to 3 of sand; water pressure to be 20 lb. higher than the air pressure; reinforcing to be expanded metal or equivalent, 34 lb. weight per 100 sq. ft.; expanded metal to be kept $\frac{3}{4}$ in. from the surface of the girders except at the edges where it was to be drawn tight; thickness of gunite to be 1 $\frac{1}{2}$ in. on all main surfaces and 1 in. on all edges; finish to be natural gunite surface without irregularity. As it was a new thing in the neighborhood, 18 months' guarantee of workmanship was asked of the contractor.

The Gunite Co. arrived on the scene and began work Oct. 14. They, like the Russell Construction Co., had trouble with their water supply, and for various causes, were delayed in their work till the frost overtook them, when their part of bridge No. 4 was just completed.

Before the steel shapes left the bridge works, holes were bored in the webs 2 ft. apart in order to permit the expanded metal to be fastened securely. The contractor suggested the use of $\frac{1}{2}$ in. rods wired through these holes, with the expanded metal wired to the rods at intervals of 6 in. to 8 in. This plan was adopted and proved satisfactory. Though the expanded metal proved entirely suitable where no corners had to be turned, such as between the stiffeners on the webs of the main girders, yet where it was necessary to bend it around corners the stiffness made it very difficult to handle. At certain places triangular mesh of 34 lb. weight was used and proved very adaptable and suitable for all corners bending at once to place.

The specified thickness of gunite though easy to put on the webs of all shapes, was found impracticable in the case of the flanges of the smaller members, and 1 in. on the edges was only possible when forms were used. It was noticed that screeding had a tendency to draw the gunite away from its close bond to the steel of the girders and reinforcing. This should therefore be avoided wherever possible.

The contractor on his own initiative placed forms on the outside of the main girders as shown in Fig. 5. This gave a very pleasing result taking away, in some measure, the appearance of the steel member. One thing which is said to be unavoidable, and which is not very pleasing to the eye, is the tendency to form here and there white patches in the natural khaki color of the gunite. Fig. 6 shows the guniting operation on bridge No. 4.

The weather prevented a start in guniting being made on bridge No. 5, but Fig. 7 shows the erection of the steel-work practically complete.

During a large part of the time the contractor had the services of an expert nozzle man whom he secured from the Cement Gun Co., of Allentown, Pa.

The photographs of the work in progress are supplied through the courtesy of a member of the city engineer's staff, by whom they were taken. The history of the project

was obtained from various reports, plans and other sources of information in the office of the city engineer.

The work was carried out by E. R. Gray, city engineer of Hamilton, through members of his staff. H. V. Thompson, consulting engineer, Toronto, was designing engineer. The writer was resident engineer, and in addition an assistant and two inspectors gave their full time to the work, while the deputy city engineer visited the job daily. The Russell Construction Co. were the contractors for the abutments, piers, floors and handrails; the Hamilton Bridge Works Co., Ltd., for the steel work; the Gunite Co. of Canada, Ltd., for the guniting, and the Concrete Pipe and Products Co., Ltd., of Hamilton, for the handrails.

ROADS IN MIDDLESEX COUNTY

THERE are 490 miles of county roads in Middlesex County, which are classified as follows: Suburban area roads, 28 miles; Provincial county roads, 50 miles; ordinary county roads, 412 miles. There are 2,250 miles of roads of all kinds in the county, 98 miles of which are provincial highways.

In connection with the provincial highway work attention is being devoted chiefly to permanent culverts, larger bridges, improvement of grading and resurfacing with gravel. During the year 1921 5 $\frac{1}{2}$ miles of concrete road 20 ft. wide were constructed from London to Lambeth, the cost of which amounted to \$310,000. This work will be gradually extended until the heavily-travelled proportions are paved.

The county road work up to the present has been the extending of the present system of gravel roads to outlying districts and the maintaining of old gravel roads, constructed shortly after the organization of the district, into the county system.

In 1906 the county initiated a county road system and expenditures that year amounted to \$30,000. The mileage of roads in 1906 was 240. Since that time the mileage has extended to the present amount and the cost has increased from \$30,000 in 1906 to \$217,000 in 1921. The same sum as last year will be spent on the roads this year.

The township roads are paid for by a direct assessment on the ratepayers of 80 per cent. of the cost and the balance by a subsidy from the Provincial Government. Sixty per cent. of the county roads are a direct charge against property owners and 40 per cent. is paid by the Provincial Government. On provincial county roads the Provincial Government pays 60 per cent. and the county 40 per cent. The county suburban area roads are paid for by the city contributing 30 per cent., the county 30 per cent. and the Provincial Government 40 per cent.

The provincial county roads in suburban areas are paid for by the city contributing 20 per cent., the county 20 per cent., and the Government 60 per cent. The Sarnia Gravel road west is in this class.

CRAMP CO. NOW OWNS PELTON CO.

CONTROL of the Pelton Water Wheel Co., San Francisco and New York, has been purchased by the William Cramp & Sons Ship & Engine Building Co., Philadelphia. The Pelton company will retain its old corporate name, and no material changes of policy are contemplated, but new officers have been chosen, as follows:

President, H. B. Taylor, vice-president of the Wm. Cramp Co.; vice-president, Ely C. Hutchinson, formerly chief engineer of the Pelton Co.; second vice-president, W. M. Moody, consulting engineer to the Wm. Cramp Co. Mr. Hutchinson will act as general manager.

This merger combines two of the oldest manufacturers of hydraulic prime-movers. The Pelton company's most important work has been the building of impulse wheels and high-head reaction turbines, while the Cramp company's work has consisted mainly of large low-head reaction units.

WATER SOFTENING AS A FACTOR IN MUNICIPAL SUPPLY*

Soft Water Better for Domestic and Manufacturing Purposes
—Soap Consumption Reduced—Lime a Useful
Agent in Water Treatment

By Wm. M. Barr,

Consulting Engineer, Union Pacific System

IT is almost an axiom that a good water supply is essential to the prosperity of a municipality. Great improvement has been made in recent years in the quality of water supplied even in the smaller towns and villages of the country. This improvement has been largely the result of the growing understanding of the direct benefit to be derived in the health of the people by the use of good water. It is natural then that the first great improvement has been along sanitary lines. There is no longer any excuse for epidemics of typhoid resulting from contaminated water supply since modern methods of sterilization are able to assure us a safer water at a nominal expense.

Frequently, however, an adequate volume of water cannot be had except from streams which may not only be polluted by organisms, but usually carry a considerable quantity of suspended matter, which makes the water distasteful in appearance as well as unpalatable. This condition has been improved by filtration, which in combination with sterilization has been brought to such a degree of efficiency that it is within reach of even the smaller communities. As civilization advances our demands are more exacting and all of our requirements reach a higher and higher plane as the possibilities for satisfying requirements are made easier.

While public officials have given considerable attention to sanitation and public health, by delivering to the people a safe water and one of good appearance, it is rare to find city officials considering the comfort of the housewife, the convenience of the manufacturer or the economics of his factory when making provisions for municipal water supply.

Some of our cities have been especially blessed by nature by having a pure, clear, cold, soft water delivered almost at their doors under ample pressure with nothing left to be done but to install the distribution system. Such a city is Portland, Oregon, where the melting snows of Mt. Hood collect in a natural reservoir and discharge into a stream at an elevation far above the city. This stream is well protected and the pipe line collects the water at such an elevation as to give satisfactory distribution. This water is as near to absolute purity as nature can supply.

Soap Consumption and Water Supply

Analysis show less than 1.5 gr. of dissolved mineral solids per gallon with practically no organic matter. This is an ideal water for all purposes and is one of the cheapest supplies in the country. The absence of hardness in this water makes the soap consumption of this city one of the lowest in the country.

Other cities have had to bring their water hundreds of miles at great expense to provide even a safe water supply of ample proportions. Los Angeles brings its water from a source 265 miles distant at enormous cost but has a good sanitary supply. This water contains 1.65 lbs. of soap destroying material per 1000 gal. of water. This will consume 1.1 lbs. of good laundry soap costing 10c or more. If used for household purposes this must be added to the cost of the water.

Omaha city water contains about 3 lbs. of soap destroying material per 1000 gal. of water although it varies considerably with the season and at times contains more than this. For a little more than one cent per 1000 gal. most of the carbonate hardness could be removed and the soap consumption be thereby reduced at least 60%.

The same is true of most of the cities using Missouri

River water and as coagulation is required on this water, demanding large settling capacity, it is only necessary to add proper equipment for feeding lime.

It has been estimated that it would cost the city of Omaha \$150 per day to treat the water as suggested. If 10% of the total supply is used with soap there would be a saving of \$500 per day in the cost of soap, to say nothing of the comfort and convenience derived from soft water.

While waters from middle western streams are looked upon as being unusually hard, there are some towns even less favorably located where underground waters are used. And while the water is perfectly clear and sanitary it carries so much material in solution that the stranger wonders what the people in that locality do when they want a bath.

If a manufacturer is considering the possibility of a new location the city having a pure soft water will be given preference over the one having hard water, assuming that other conditions are equal. It is, therefore, to the advantage of a community as a whole to offer a satisfactory industrial water supply to those who are seeking locations for new industries. But the manufacturer is not the only one to be considered, nor should it be so. If you consider the greatest good to the greatest number, we should reach all classes of citizens and there are few in any community who do not use soap. If there be such I will venture to say he would not object to taxation on that ground.

Many people will say that softening a municipal water supply is too expensive. The city of St. Louis has not found it so, and they produce more than a hundred million gallons of soft water per day. It is a noteworthy fact that people going to that city from many other middle western points comment favorably upon the soft character of that city's water supply. The total hardness is reduced approximately 60%. I do not mean that it would be feasible to remove all of the scale forming salts from the city supply, but the removal of the carbonate hardness makes a vast difference in the washing qualities of water, and adds much to the comfort of the people, and while the people may pay a premium on such a water they are simply transferring the charge to the water account from the soap account. It is certainly cheaper to remove the carbonate hardness with lime than with soap. Most of the cities that treat their water supply in this way do not attempt to remove all the carbonate hardness as some consider it more palatable if all the hardness is not removed. If the water is well aerated, this objection does not hold.

Advantages in Using Lime

In addition to this there are other advantages to be gained in the water purification process itself by the use of lime, which is added primarily for the purpose of softening the water. Omaha has a water system in which filtration does not play a part, and as a result there are times when this water is not perfectly clear. It is possible by using a sufficient amount of lime to remove a large portion of the carbonate hardness, to obtain a clear water even with a reduction of the amount of alum used for coagulation.

My attention was recently called to a small city having a very complete equipment for treating a muddy river water with lime, coagulating it with alum, settling, filtering and sterilizing with chlorine. They were having difficulty in obtaining a clear water and the superintendent had used a considerable excess of alum attempting to coagulate this water and thus clarify it. It was found that by increasing the lime charge the amount of alum could be reduced and a much clearer water obtained than before. It is also worth noting that coagulated waters treated with lime show lower bacterial count than those where lime is not used, thus requiring a lower chlorine treatment.

The up to date industrial plant in this city has provided itself with a complete water softening equipment purely as a matter of economy without any coagulant other than the precipitates formed by the reaction between the lime and soda ash with the scale forming salts contained in the water. This applies to plants using raw Missouri River water as well as those using the clarified city water. Nor does this exempt the municipal industries themselves who

*Paper read before the Iowa Section of the American Water Works Association, at Omaha.

have found it to their advantage to install such treatment. From this treatment a surprisingly clear water is obtained which gives little trouble in boilers from the formation of scale and which yields a substantial return on the investment in the efficiency of operation and economy in maintenance of the power plant.

I do not mean to advocate here that filters should not be used, I believe any city is entitled to the best water that can be produced and therefore believe in filtration following coagulation and softening with ample settling basins to clarify it. Such treatment greatly reduces the amount of filtering area required and therefore the initial cost of filters as well as reducing the operating cost.

There are many people who consider softening of a municipal supply an unnecessary refinement but I submit to you that if a water can be furnished with more than 50% of the hardness removed, at a cost of from one to two cents per 1000 gal., that such an operation would pay and be greatly appreciated by a large number of citizens. This method is particularly applicable to city plants where turbid waters are taken from the streams and clarified by coagulation and settling. The necessary softening equipment can be installed on such a plant at a nominal cost and I know of no improvement involving so small an expenditure that would meet with such universal approval in the community.

Cap De La Madeleine Water and Sewer Systems

Old Systems Became Inadequate as Population Increased — Water Supply From Wells and Surface Drainage Collected in Reservoir — Pumping Plant — Details of Materials Used — Cost of Work

By ROMEO MORRISSETTE
Town Engineer.

CAP DE LA MADELEINE, Que., is located East of the St. Maurice river and North of the St. Lawrence in the neighborhood of Three-Rivers, both towns being connected by bridges which span the river St. Maurice, the main industries are shipbuilding and paper manufacturing. Cap de la Madeleine was incorporated in 1918, the area of the town being 4,235 acres of which approximately 700 are the built-up section through which there is now laid complete water and sewer systems. The town is nearly level with the exception of the Northern section which is at the foot of the Laurentian Mountains and is called the Coteau. The population has grown as follows:

Year.	Population.	No. of Houses	Value of New Construction.	Total Municipal Valuation.
1901	900			
1911	1,464			
1916	3,322	15	\$35,000	\$1,284,905.00
1917	3,825	10	28,000	1,860,895.00
1918	4,235	25	50,000	2,157,270.00
1919	5,555	75	187,000	4,398,715.00
1920	7,315	149	449,175	5,388,189.00
1921	6,730	40	277,000	6,640,351.04

There are approximately 889 houses, 554 tenements, one paper mill, one shipyard, one saw mill, one foundry, three churches, one college, one convent and five schools in Cap de la Madeleine. The municipal valuation is as follows: Assessable, \$3,440,375.06; non-assessable, \$3,199,975.98.

By a by-law dated March 28, 1917, the parish of Cap de la Madeleine granted a franchise of Alphonse Anbin, of St. Jerome du Lac St. Jean, on the understanding that a water supply and sewer system was built. In the same year a company was organized and was called La Campagnie de l'Acqueduc du Cap de la Madeleine Limitee. The parish had become a town and a company's bonds were guaranteed by the new town; they were issued in 1917 and made payable in 1927 with 6% interest.

Original Water and Sewer Systems

In 1918 a 10-in. main was laid for a length of 4,200 ft. also 7,170 ft. of 8-in. pipe 16,540 ft. of 6-in. pipe, 821 ft. of 4-in. pipe and 3,956 ft. of 2-in. pipe. The total length was 32,689. To which were added 28 gate valves and 47 Ludlow hydrants. All the pipes and over 4 in. in diameter were

class C cast iron pipes and the others were galvanized iron pipes. The sewer system consisted of 1,680 ft. of 20-in. clay pipe used chiefly as collectors from the street mains to the river outlets, 14,966 ft. of 12-in. pipe and 2,200 ft. of 9-in. pipe; the slopes varied from 4% to 0.20%.

A reservoir was built at the top of the hill, 900 ft. from the pumping station and at 60 ft. elevation above. It was a circular type, 86 ft. in diameter at the top and 50 ft. at the bottom, and 10 ft. high. No reinforcement was placed in the bottom but $\frac{3}{4}$ -in. and $\frac{1}{2}$ -in. twisted bars were used in the sides. Two single-stage 4-in. Keystone pumps were installed, 6-in. suction and 4-in. discharge. The water was supplied from a series of artesian wells $2\frac{1}{2}$ in. in diameter spaced 10 ft. centre to centre along the intake pipe. This system has given a good service since. The total number of wells is 37.

In 1918 the built-up section of the town was approximately 200 acres stretched all along the Quebec-Montreal road, a distance of approximately $2\frac{1}{2}$ miles. As soon as the development of the town increased the company was unable to carry further works on its own resources and without additional help from the town. Then came the ques-

PLAN OF WATER DISTRIBUTION SYSTEM. CAP DE LA MADELEINE

tion of municipalizing the systems. The error committed by the town at the time was that it did not install them itself. The price asked by the company was \$210,000, the town, as payment assuming the company's 6% bonds. A

already assumed by the taxpayers. However, plans were prepared so that any time the town decides to carry out this plan, it will be easy. The plan called for laying 9,045 ft. of 4-in. pipe and 15,275 ft. of 6-in. pipe. Work was started on that branch September 8 and on January 1, 1922, 7,969 ft. of 4-in. pipe and 13,508 ft. of 6-in. pipe were laid. Twenty 6-in.-13 4-in. and one 8-in. Jenkins gate valves were installed. They were supplied by J. B. Loranger, of Three-Rivers, Que. Also 90 plugs, 41 T's, 12 reducers, 4 bends, 33 crosses and 14 sleeves. The cast iron class C pipe was bought from Canada Iron Corporation, Three Rivers, and supplied by J. M. Bellefeuille, Cap de la Madeleine. The price paid was \$67.50 per ton delivered on the site for 6-in. pipe and \$72.50 for the 4-in. pipe.

About 16,601 lbs. of lead were caulked in the 6-in. joints, an average of 13 lbs. per joint, total, 1,277 joints. There were also 6,515 lbs. of lead caulked in 4-in. joints, an average of 9-lbs. per joint; 714 pounds were melted.

SECTIONAL VIEW OF RESERVOIR, SHOWING REINFORCED CONCRETE BUTTRESSES SUPPORTING NEW PART OF STRUCTURE

vote was called from the ratepayers and was favorable to the purchase, which took effect on April 5, 1921.

Extension Approved

The question of extending the system in order to give service to all the taxpayers was the first thing considered and the writer received instructions from the town council to prepare plans and report on the cost of the proposed extension. An estimate was prepared and submitted to the council on May 27, 1921, and adopted. This was approved by the ratepayers and the Provincial Government. On September 1, 1921, work was commenced, and it is now nearly completed.

The first question to be considered was the capability of the springs to supply water and observations and measurements were made from 37 artesian wells and from the surface water. Each well furnished ordinarily 14 gallons of water per minute. The conformation of the land is as follows: 4 ft. of humus, 6 ft. of alluvial sand and a deep stratum of clay. Many of these wells were disconnected recently and replaced by 3-in. wells. In 75% of them water reached naturally a higher level in the well than the water level of the pond into which they are sunk; the balance flowing over freely. This will give an idea of the quantity of water flowing through the soil if we consider that these wells are sunk in a third of an acre. The total discharge for eight hours' pumping was found to be 250,000 gallons. Secondly, the water comes also from springs and is spread over the soil. The quantity of water which may be collected immediately at the surface is in the neighborhood of 3,000 g.p.m. The writer advised the town to control as much land as possible, to plant trees, so that the ground be kept wet with the least chance of evaporation. This was based on the principle that the humus retains two and a half times its volume of water. Many acres were immediately secured.

Extent of New Systems

A general plan was prepared and a 14-in. main contemplated, but as it would have cost about \$221,400 in addition to the \$150,000 estimated for the extension to service alone, this scheme was dropped on account of the small financial resources of the town and the large indebtedness

Analysis of Cost Per Unit

(A) To lay-in 6-in. pipe per standard length.

Wood to melt lead	\$0.128
13 lbs. of lead at 6 1/2 cents	\$0.845
Jute	0.005
Caulking	0.800
Total	\$1.778
Cost per lineal foot	\$0.148

To lay-in 4-in. pipe per standard length.

Wood to melt lead	\$0.089
9 lbs. of lead at 6 1/2 cents	0.575
Jute	0.004
Caulking	0.567
Total	\$1.235
Cost per lineal foot	\$0.103

(B) To direct the work.

Wages of foreman per lineal foot	\$0.0333
--	----------

(C) Cost of trenches per foot.

Planking or panneling	\$0.0980
Temporary bridges	0.0103
Excavation	0.3761
Filling in	0.1564
Total	\$0.6408
Cost per unit of length	\$0.7408

(D) Laying-down Clay Pipe.

Dia. of Pipe	Lbs. of oak-um per joint	No. of joints per bag of cement	Cost of labor per joint	Cost of oakum	Cost of concrete	Total cost	Cost per lin. feet.
9 in.	0.14	19	\$0.114	\$0.0098	\$0.0432	\$0.1670	\$0.0557
12 in.	0.21	12	0.171	0.0147	0.0700	0.2557	0.0852

12 in.	54	1428
15 in.	35	1424
18 in.	14	1054

Excavating and Filling Trenches

Excavation and filling in of trenches was carried on for a distance of 26,040 ft. The maximum depth excavated

CONCRETE MANHOLE WITH FORMS REMOVED

was 14 ft. and the minimum was 3 ft. 6 in. The average depth to which pipes were laid was 6 ft. 9 in. as per actual measurements on profiles. There were 31,465 cu. yds. of excavated material removed and replaced in the trenches. There were 40,645 hours spent on the job and the total cost amounted to \$13,819. The excavation cost an average of \$0.37608 per lineal foot of trench and the filling in \$0.15637 per lineal foot or a total of 44 cents a cu. yd. The work was done by day labor, men being paid 32½ cents per hour. Two methods of bracing earth in the trench were used, sheet piling and panels and braces placed every 4 ft. centre to centre along the trench. Pile sheeting proved to be the more economical method, principally where soil was alluvial sand which is encountered in great quantities at Cap de la Madeleine; also in the western part of the town where there is water-bearing soil.

The average cost of planking was as follows:

12,230 ft. of studding 3 in. by 4 in.	\$ 520.64
18,019 ft. of 2-in. spruce	759.56
Wages at 2,590 hours	1,285.25

\$2,565.45

The cost per lineal foot of trench being \$0.098.

Manhole Construction

Manholes were built at the intersection of every street. They are 42 in. in diameter inside of circular type, 8 in. thick and made of 1-2-4 concrete. The trouble with the old system was that sand comes in the pipe with the storm water. The manholes in this system are built with the pipes laid flush with the manhole bottom and they are of small size. The sand has no chance to deposit which gives a lot of trouble and costs a great deal in maintaining the system in a good running condition. To obviate this trouble in the new manholes, the pipes enter the manhole 9 in. and sometimes 12 in. over the bottom, depending on the nature of the soil adjacent to the section of the manhole. This will give a chance for the heavy matter in suspension to stay in the manhole and eliminate the chances of decrease in the velocity of the sewer which was computed to furnish at least a velocity of 2 ft. per second when running full. Demountable forms were used for the erection of these. Three of them were built and served for the 37 manholes built during the fall. The covers were furnished by Henri Nobert, Three-Rivers, and supplied by Francis Hankin & Co.,

Montreal. The cost was \$1855.63 including 37,112 hours of labor.

Each man-hole cost \$108.44 which may be summarized as follows: Cast iron cover, \$30.25; Labor, \$50.19; Cement, \$18.00; Sand, \$2.25; Crushed stone, \$7.75; Total, \$108.44. The concrete cost \$22.34 per cu. yd. on an average with forms included. The high cost of the concrete on this job was due to the fact that a small quantity of concrete was mixed by hand at every manhole. The handling of materials and forms was also a big factor in the cost.

Service Pipe Connections

Water supply and sewer service connections were installed on approximately the whole length of the new system. Trenches were excavated at a less depth in the earth and at a time when the earth began to freeze in the fall. For this purpose streets were opened on a length of 4,537 ft. at a mean depth of 5 ft. The excavation and filling in cost 27 cents per lineal foot. The following materials for rock connection were used: ¾-in. galvanized iron pipe, 6-in. clay pipe for sewer, one 6-in. bend, one Mueller curb cock, one Mueller corporation cock and box buried 5 ft. Average length of service pipe laid in was 24 ft. and 6 in. Labor costs per unit, \$5.41; Tools, \$8.72; Materials, \$20.84. As the tools include a tapping machine, etc., which are being retained by the corporation for further work, this item has been deducted from the total cost which makes the cost of each service \$26.25 for clay pipe laid during winter months.

As there was a long stretch of 18-in. clay pipe to be laid through a swamp at a depth varying from 10 to 16 ft. and because many men were unemployed, it was decided to carry this work through the winter months. The results have proved satisfactory as 1,000 ft. have been laid up to January 31, 1922, and the analysis of the cost is as follows: Unit cost per lineal ft. supervision, 0.15; Pipe laying, 0.255; Excavation, 0.905; Total, \$1.310. The filling in was left for the summer months as the earth on the bank was frozen. All the materials were bought by the city. The 18-in. clay pipe cost \$1.40 per foot delivered on site and the 15-in. clay pipe cost 0.965 per ft.

Reservoir Increased in Capacity

The top of the old reservoir built in 1918 by Mr. Arcand was raised 6 ft. As there was no reinforcement in the bottom, the writer was skeptical about adding an overload due

CONCRETE MANHOLE IN DEMOUNTABLE FORMS

to the new mass of concrete. To take care of this buttresses were built 15 ft. centre to centre around the new structure. These buttresses were resting on a rectangular footing 4 ft. by 5 ft. by 2½ ft. Reinforcing rods were connected with the wall and the footing in such a manner that the new structure is completely independent of the old one. The work was started on September 8 last and completed on October 1,

1921. On October 8 the reservoir was filled to its full capacity, 537,330 gallons. The walls of the new structure are 12 in. thick at the top and 15 in. at the bottom. "Pudlo" cement was used as waterproofing in the proportion of four pounds per bag of cement. The reinforcement consisted of $\frac{3}{4}$ -in. twisted bars spaced 12 in. centre to centre crosswise and 8 in. lengthwise. All the work was done by day labor and the concrete mixed by hand. The total cost per cu. yd. was \$19.50, including the forms, labor and materials. An earth embankment was also built afterwards to preserve the reservoir from the frost. This work was also done by

RECONSTRUCTED CONCRETE RESERVOIR—
CAP DE LA MADELEINE

day labor and cost on an average of 30 cents per cu. yd. Cement was supplied by J. B. Loranger and J. M. Bellefeuille, Cap de la Madeleine, lumber by Morin & Freres Ltd., Cap de la Madeleine and "Pudlo" cement by the Spiedman's Agencies, Ltd., Montreal.

Pumping Station

The new pumping station is a brick and reinforced concrete structure. Lumber has been used only in the false roof. Reinforced trusses are 15 in. deep by 12 in. thick. The building is 42 ft. 6 in. long by 20 ft. wide. There will be installed in this building a three-stage automatically balanced centrifugal pump; the intake will be 8 in. and the discharge 6 in. The working pressure at the discharge will be 125 lbs. per sq. in. This pump will be driven by a 150 h.p. electric motor and a 180 h.p. Sterling gasoline engine. A Venturi meter and a pressure gauge register will also be installed.

Hydrants

Thirty more hydrants have been bought and 22 are now in service in addition to the 47 on the old service. They are of the "Ludlow" make with two outlets and a steamer connection. In the old system the hydrants had only the two standard outlets which were not suitable if the municipality decided to buy a fire pump in the future, in which case all the hydrants would have to be changed. Therefore it was decided to proceed immediately to meet future requirements. The price paid for hydrants was \$80.00 each, delivered. They were sold by H. Massicotte & Freres, Ltd., Cap de la Madeleine, Que. They were installed at the unit price, viz., \$18.00 each, the town furnishing all the materials.

Showing the rapid progress that has been made in the development of electricity, J. F. Peters, an engineer attached to the laboratories of the Westinghouse Electric and Manufacturing Co., Pittsburg, Pa., addressing the Hamilton branch of the Engineering Institute of Canada at the Westinghouse auditorium on March 21, stated that it was now possible to transmit power up to 220,000 volts to a distance ranging from 250 to 500 miles. It could be transmitted further even than that, the speaker declared, but the cost was too great to make it of any commercial value over that distance.

SUBMARINE COAL MINING

GREAT technical difficulties have been overcome by Canadian mining engineers in the extraction of coal and iron ore from under the sea, F. W. Gray told the Montreal Branch of the Engineering Institute of Canada, addressing them on April 6, on the subject of submarine coal mining in the Sydney district of Cape Breton.

Mr. Gray gave great credit to the Canadian pioneers of submarine mining, who had made possible still greater developments in the future.

The lecturer referred to the remarkably small number of fatalities that have been caused by inundation of submarine coal mines, a fact which reflected credit on the men responsible for the direction of these operations. Only once in Japan and once in England had the flooding of a submarine coal mine resulted in serious loss of life.

This danger of flooding was the chief obstacle in the engineer's way, in carrying on submarine coal mining. Once the excavation got underneath the bed of the sea, an intimate knowledge of the nature of the sea bottom was essential to safety. Pockets might occur in the sea bed, which if not known might prove disastrous. An intimate knowledge was also necessary of the nature of the strata between the sea bed and the coal, in order to know the extent of the danger of water percolating into the mine, and the steps necessary to guard against it.

The Sydney mines, the speaker said, constituted the largest submarine coal field in operation in the world. Coal was also extracted from below the sea bed at points in Great Britain, Australia, Japan and Chile. Eighty per cent of the Cape Breton coal reserves were under sea, and seventy per cent of those of Nova Scotia were also below the ocean bed. In the case of the Princess Colliery, belonging to the Nova Scotia Steel and Coal Co., at Sydney Mines, coal was being extracted as far as $2\frac{1}{4}$ miles out from the shore. At many other points coal was being worked at distances of one mile or more out from the shore, and at a depth of 1,400 ft. below the bed of the sea.

U. S. GOVERNMENT MOTION PICTURES

IN LINE with its policy of informing the public, especially those who pay the taxes, as to the economies that may be effected in the construction of highways, as well as the proper methods of construction, the United States Government, through the Bureau of Public Roads, Department of Agriculture, has just completed for free distribution and use in motion picture houses as well as at conventions, chautauquas and educational conferences throughout the country, two reels of pictures showing in detail the construction of the various types of asphalt roads. The pictures were exhibited for the first time at the recent American Good Roads Congress in Chicago. The pictures were taken last summer in New York, New Jersey, Pennsylvania and other states under the direction of E. J. Wulff, senior highway engineer, U. S. Bureau of Public Roads, and E. J. Kelly of the Motion Picture Division, United States Department of Agriculture. The pictures were produced particularly for the purpose of showing how the best results may be obtained in asphalt construction. They are loaned to responsible parties free of charge, except for transportation costs. The government pictures offer an interesting and instructive addition to any motion picture program. Each reel is approximately 900 ft. long and about fifteen minutes time is required for its showing.

The sum of \$1,317,508.61 has been paid to the Ontario Provincial Government to date from the grant of \$20,000,000 made by the Dominion Government for good roads. So far the Province of Ontario has not filed for approval under the federal highways act any project for highway construction north of the Severn River. Roads in Northern Ontario were built, and where necessary, maintained by the colonization roads branch of the Ontario government, which is distinct from the Ontario Highways branch.

HIGHWAY ACCOUNTING*

System in Force in Elgin County Highway Department —
Field and Office Reports and Forms Employed—
Every Expense Item Recorded

By G. F. Pince

Road Superintendent Elgin County

WHEN the writer was appointed Road Superintendent of Elgin County we had no regular system of bookkeeping for taking care of our highway accounts. We started out possibly in a crude way; in the first instance each foreman was furnished with a little time book in duplicate. He sent one copy to my office and from that book I copied on to a time sheet the time of every man certified to by the foreman; the other book he kept himself.

Then there was a county road order passed to pay the amount on the paysheet and a cheque for the whole amount was sent to each foreman. Later we adopted the system of sending each man on the highway system an individual cheque.

Various Forms Used

Then we adopted a small pay sheet or weekly report sheet. Form No. 1 of the county highway system is a statement of the travelling expenses of the road superintendent. Form No. 28 is an order for payment on the treasurer. Form No. 2 is an order form that we have always used in the County of Elgin. If supplies are needed for the county I order then and have a copy of that order on the order form which is very convenient to have in the office. We have an ordinary time book which every foreman has to have and in which he keeps his accounts. Form No. 4A is a weekly report of the construction foreman which gives the distribution of all the work he has done. The maintenance form No. 4B is identical with our form. I believe these forms have been recommended by the Department of Highways.

Then we have our order form No. 5A, called the pay list. It contains a duplicate of all time, both construction and maintenance. The order form is folded in four laps and the amount of time the foreman has sent in is placed within the order form, it is then handed to the treasurer with the signature of the county road chairman and myself and on the strength of that the treasurer passes it.

Then we come to the distribution sheet which I always retain in my office. This sheet contains an itemized account of everything, the name of every man who receives a dollar in the county, is placed on that distribution sheet and both the treasurer and I have a duplicate.

On distribution sheet No. 18 we have an exact counterpart of our county road order, therefore it saves some trouble in checking up. For instance we can take our distribution sheets and the county road order, both are identical. I would advise that the distribution sheet be an exact duplicate of the county road order.

Loose Leaf Ledger

Our ledger is also retained in my office and the work is done by my stenographer. This is a loose leaf book with three sheets of different colors, yellow, white and blue. The yellow sheet is used for a general expense account; the white sheet is our construction account and the blue sheet is our maintenance. Each sheet represents one road number. Every road is numbered and is represented by that sheet on the ledger and I can tell exactly every piece of construction work on every road, whether coffer dam, excavating, gravelling, hauling gravel or material of any kind as well as labor, maintenance, dragging of any re-surfacing; every part is specified on that construction sheet in the ledger and can be seen at a glance.

*Paper read at Twentieth Annual Meeting of the Ontario Good Roads Association, March 2.

The towns and villages receive a grant from the County of Elgin equal to the amount they pay in. That money has been expended under my supervision and it is also taken care of in the ledger. I found out at the outset in our county system that we were buying quite a number of tools and different machines. We have three trucks and some gravel outfits but no larger rollers, tractors nor a very heavy nor expensive stock of machinery, but I found it necessary to keep a record of all the machinery and tools we had. I think it is a very important thing for a road superintendent to keep an inventory of all tools and machinery. I have that inventory taken every year. Once I order on my order book a tool or any piece of machinery, I immediately place it on the inventory sheet and charge it up to the special foreman who receives it. From this I can tell in looking over my inventory sheet just where a certain tool should be because we constantly have inquiries and we change these back and forth, and when there is any exchange made I always give one road foreman an order to go and get from the other road foreman whatever he requires in the shape of tools or machinery. That inventory is taken once a year. If a tool is lost I simply remove it and do not have to consider it any further.

Keeping Tool and Gavel Pit Records

In the County of Elgin we have five gravel pits. I keep a separate account of each gravel pit and I have a sheet here for the gravel pit foreman to use. On that sheet is entered the different kinds of work that he will have to do. When it is sent in I immediately take from it and place over on the gravel pit book an exact counterpart of the sheet; therefore, I can compare the cost of stripping one pit against another the other and can tell how much it costs to strip a cord or a yard of gravel. We have a weekly report sheet for the foreman operating the gravel pits and screens. On that sheet he enters the number of men employed and the number of yards or cords of gravel that he has taken out that day or hauled in.

Then we have three trucks and we have a daily report from each truck foreman. The gravel pit foreman's and the truck foreman's sheets must compare as to the number of cords of gravel and so forth that they have removed on that particular day. At the end of the year I can tell our county just what it has cost us for each individual gravel pit.

I do not say it is the duty of the road superintendent to keep up all that office work and look after the roads because that is impossible for him to do, without the assistance of a clerk. You are paying out from \$200,000 and \$600,000 of the ratepayer's money and he wants to know where it goes. We are liable to be criticized but we should be able to protect ourselves and there is no other way of doing that unless we have a strict accounting system.

At the Motor Show at St. John, N.B., recently, an address on "The Value of Good Roads" was delivered by B. M. Hill, chief engineer, Public Works Department, New Brunswick. Mr. Hill outlined the work of the department and urged his hearers to continue their co-operation with provincial authorities for better roads. He explained the necessity of Federal support for the next five years in improving the provincial roads and urged dealers not to encourage purchasers to use any truck heavier than two and a half ton type, as heavier trucks did irreparable damage.

The divisional road engineers of the Nova Scotia Provincial Highways Department held a conference at Halifax recently. Engineers attended from each of the seven divisions in the province. The conference went very thoroughly into the work that had been done, the improvements which may be made upon the experience of the past year, the methods of conducting the work, and the application of their experiences to the programme which is now being laid out for the coming season.

THE RELATION OF CITY PLANNING AND ZONING TO THE SELECTION OF TYPE OF PAVEMENT*

Describes City Maps Prepared at Baltimore — Division of Cities Into Zones — Kind of Pavement in Zone Determined by Traffic

By Jefferson C. Grinnalds

Secretary, Zoning Commission, Baltimore, Md.

CITY Planning is primarily a problem of transportation. Its aim is to provide adequate and convenient arteries for traffic from any part of a town to any other part. Therefore the selection of the type of pavement depends on what sort of service the streets may be called upon to carry, as well as on what will be the volume or density of that traffic. Zoning aims to direct the orderly and logical growth of a city. It prescribes the use to be made of the lands and buildings in different parts of the town, as well as the bulk of the buildings. Therefore the selection of the type of pavement depends also on the use of property because the use will determine the kind of traffic, that is, whether it will be heavy commercial of a local nature, heavy through commercial traffic, light or mixed through traffic or local light pleasure traffic.

Retrospective

Cities used to be planned merely by laying out on paper a lot and street scheme by a land owner or surveyor and the latter probably staked the lines and corners on the ground. The original town sites were comparatively small in area. The situation was probably chosen on the shore of navigable water, at the intersection of two important turnpike roads or later at a promising railroad junction. In early days in the United States the street layout was made by those who were not presumed to have any special skill in design of street systems beyond the knowledge possessed by a surveyor or real estate developer. It is doubtful if any conception of the present day duties of highways could have been experienced then. Converging toward the towns were at first paths through field or forest. Then came wheeled vehicles making tracks over the trails.

The writer has been informed that post roads were the next step to be followed by what were known as turnpikes. Then as the turnpike companies sprang up and developed, not only were rights-of-way acquired, but they were surfaced, repaired and kept in more or less passable condition. Here was the beginning of the selection of a type of pavement ostensibly suitable to the kind and amount of traffic. The turnpikes were to be the forerunner of the major street plan of today. They were generally radial with respect to the centre of the town and the then purlieus. As the town expanded, it tended to grow outward on all radials except where expansion was impossible or impracticable due to topographic conditions or to some natural barrier. The old radial roads were pushed farther out and stretched to other important towns or centres by fairly direct routes. They had fair grades, because there had to be a maximum gradient beyond which it was not possible for horse drawn vehicles to ascend. When traffic had increased and an income for maintenance was assured by collection of tolls, paving in a crude form followed. Crushed stone or gravel was spread over the surface to be worn down compactly by the traffic. John Loudon Macadam and Thomas Telford, the famous Scotch engineers, designed their respective types of pavement and they came to be the best paving practice.

Modern Pavements an Improvement

Paving and city planning have both advanced within the last generation to a high degree of efficiency. In the matter of paving there is a long list of various types of pavement from which to select the material to be laid on any particular roadway. The Macadam and Telford paving of so long ago are even still in use and are appropriate pavements for certain kinds of traffic. The tendency, however,

is to select a water-proof paving material, if possible. Oiled macadam and tar macadam have come into use. Bituminous concrete, bitulithic, sheet asphalt, wood blocks, scoria blocks, asphalt block, vitrified brick, granite block and concrete roadways are all later types of pavement from which the engineer may select that most suitable for any particular roadway which he contemplates paving. Since city planning has reached the present advanced stage, we endeavor to select roadways scientifically in the city which may be expected to become the future heavy traffic streets; the arterial street system of the city. The selection of this major street plan is one of the first steps, after certain basic surveys have been made. It is well here to suggest the proper kind of a survey on which to work out a city plan.

From the experience of the city of Baltimore it has been found that a topographic map on the scale of 200 ft. to one inch, showing contours with five-foot intervals, is a practical map to work on. A map has been prepared to show the present location of industries in the city of Baltimore. There has been super-imposed upon the original industrial location map the tentative arterial street plan which is now proposed for this city, together with a population distribution compiled and tabulated from the census of 1920. It is possible to see at once from this map where the industrial areas are and which streets serve those areas; also where the residential part of the town is located. Since each dot represents 100 people, the map shows roadways which are intended to serve these residential areas, local residential streets not being on this map. It is obvious that there are many radial streets which are at present main traffic streets and, in fact, have been main traffic streets for a long period of years. In almost every case they are coincident with the old main radial turnpikes. There have been some slight changes, of course, in their alignment, in their width and grades. Some of them may even be further widened when traffic demands it.

Before selecting all of these streets as main traffic streets, traffic counts had to be made, the traffic congestion studied, traffic density determined, etc. In other words, it is necessary for the city planner to compute, as accurately as possible, what will be the demands upon a street in a generation or two hence, so that he may plan the street of sufficient width to accommodate the load which it may be expected to carry. It is essential to give thought to the kind of traffic which may predominate on any street under study. For instance, the streets which serve the water front property, those which lead to the heavy manufacturing centres, industrial areas and many of the radials and cross town streets may be expected to carry hauling of the heaviest kind. From study of the map and conditions observed in the field, it is evident that certain streets will carry principally light weight vehicles and not heavy loads. The roadways which will be expected to carry the heaviest loads and large numbers of them, no doubt should be paved with a heavy, durable material of high tractivity on a thick base which is laid on a firm, well-rolled sub-grade. The grades, too, will have their bearing upon the kind of paving material. The writer observes that many heavy haulage highways are paved with sheet asphalt, but that would certainly not be the kind of pavement to be laid on a street having a four or five percent grade and over. Granite block with cement or bituminous filler or hillside vitrified brick might be very appropriate for steep grades. It is not always possible for the city planner to avoid grades of over four or five percent on main traffic streets, but since they must exist, the most suitable pavement should be chosen for them.

Zoning — Planning for the Future

Within the last decade there has grown out of city planning investigation a branch of city planning known as zoning. By it cities are divided into certain districts in which are permitted certain uses of the land and buildings. The heights of the buildings for each separate district are regulated suitable for their prescribed use and the percentage of the area of the lot which they may occupy is limited. Height and area restriction, sometimes known as "occupan-

*Paper read at the City Paving Conference, Philadelphia, Oct. 22, 1921.

cy" are often called by an equivalent designation, such as volume or bulk. Before a zone plan is drawn an accurate survey of all the existing conditions within the city limits is necessary. There must be made a map which shows by a color scheme the use of every parcel of land and every building in the city divided into classes, of course. For example, a color denotes all the property devoted to single family residence use; another color denotes two-family residence use; another denotes property devoted to residence and occupied by three or more families; another color stands for business of a retail type; another color for wholesale business, warehouses and light manufacturing use; other colors denote industrial areas, park areas, cemeteries, etc. A second map must be prepared showing the heights of all the existing buildings in the city, classified by a color scheme. A third map is necessary to show the percentage of area of the lot which is covered by every building. The last of the basic data maps preliminary to drawing a zoning ordinance must show land values usually determined by classifying the assessed land value per front foot.

What Will Zoning Accomplish?

When a zoning ordinance has been in effect for a generation or two, definite results will be noticeable in a city where such regulation is effective. The residential areas will not be invaded by inappropriate business or industrial developments, but will show an orderly growth somewhat uniform, where the people will dwell in the quiet enjoyment of their homes undisturbed by the noisy intrusion of heavy traffic. The business area will be compact within the central part of town and it will reach out, too, along the fronts of the main arterial streets. The retail shop and the office building will not have next door to them factories which emit smoke, gas, fumes, odors, dust and excessive noise. The industries will be grouped where they have adequate rail or water transportation facilities, where they will not be hampered by the restrictive regulation incident to residential property and their sites will not be cut up by useless streets. This last mentioned kind of use will be in locations where investment may be considered safe, where there is room for expansion, where they can enjoy all possible encouragement to grow and to perform their function of increasing the city's commercial greatness.

Zoning Determines Kind of Pavement

What has zoning to do with the selection of types of pavement? It will determine for a long period of years what kind of development may be expected in any part of the city. The paving engineer can refer to the zone plan and the written ordinance. He will know with a reasonable degree of certainty that a street which leads up to an industrial zone is to carry heavy loads in numbers commensurate with the area of that district. From the city plan and the topographical maps, he can determine the grades and width of roadway. Comprehensive city planning studies which include attention to every engineering feature, to every public service structure under ground, on the surface or overhead, will give him the kind of information which he needs. In fact, everything that may have any bearing whatever as far as the city planner can determine, has been mapped and considered in drawing the official city plan.

Another map, for instance, will show the present park system of the city. It is a fact that bordering on our present parks can be found all kinds of use, including residential, retail business, light manufacturing and so-called nuisance industries. The last three are evidently inappropriate uses to make of park front property. So it is hoped by zoning to prescribe as far as possible, residence use for park front lands, in order that the greatest enjoyment and largest return in recreation may be had by the people, secured by parks adjacent to their dwellings or at least nearby. The pavements round about the parks may then be suitable types for through traffic streets intended to carry principally pleasure vehicles and local residential streets. On streets of this nature smooth dustless pavements are suitable that may be laid on heavier grades than would be suitable for

industrial streets. The very qualities which are so adapted to residential streets make them inappropriate for heavy haulage highways; one, for example, slipperiness on smooth streets, especially in wet weather.

Railroad and Water-front Facilities

Any city plan must consider railroad terminals, freight yards and rights-of-way for two reasons. The first is that they must have direct routes to every part of the city. Second, they must not be hampered by too many streets cutting into them and making unnecessary grade crossings. The grade crossing nuisance must be emphasized. Every comprehensive city plan must consider the absolute elimination of every grade crossing on through traffic streets. On the streets leading up to, over, under or through railroad properties, all have their particular kind of traffic. Therefore, the type of pavement must be suitable for the kind of use. It must be of sufficient width; it must have proper material to withstand heavy iron-tired vehicles, as well as the ever increasing motor truck traffic.

The water-front must be served by properly situated water-front streets at suitable distances from the shore line and approximately parallel with it, as also it must have ready access to every other part of town. It is necessary to consider that the streets encircling the water-front would ordinarily carry a belt line railroad, probably municipally owned. Heavy paving material on sufficient foundation is required for the duty of these kinds of streets.

Paving Engineers Welcome City Plan

The city paving engineer certainly should welcome a city plan which is scientifically designed to suit the particular needs of every individual part of the city and of the city considered as a whole. The street plan and the zone plan should be worked out simultaneously and co-operatively. Then it will be known what the streets are to serve, what use may be expected of the property bordering on the streets or at their termini. Population distribution and industrial distribution as anticipated by the zoning plan will give a fair estimate of the amount of traffic which a street may be expected to carry within some definite period of years. It is to be hoped that a city plan and a zone plan will guide the paving engineer so that his streets will give the best services, that his moneys will be expended most judiciously, with reference to a scientific study, that the cost of maintenance will be at a minimum and that tax rates and bond issues may be lower; but if there is a fixed sum available for paving, that he will get more mileage by the added efficiency and economy that might be studied.

FREIGHT TONNAGE TO MILEAGE ON CANADIAN RAILWAYS

AT THE freight equalization hearing before the Railway Commission at Ottawa, statements showing density of freight traffic to mileage were filed by T. Marshall, of the Toronto Board of Trade. The freight tonnage and mileage by provinces from Oct. 1920 to June 1921 inclusive of all Canadian railways were as follows: Maritime Provinces, mileage 3,704, freight tons 6,009,677; Quebec, miles 4,877, tons 12,040,777; Ontario, miles 10,988, tons 32,486,435; Manitoba, miles 4,193, tons 3,452,257; Saskatchewan, miles 6,145, tons 4,313,709; Alberta, miles 4,354, tons 5,795,383; British Columbia, miles 4,287, tons 3,048,588. The total mileage was 38,544 and total tonnage 67,146,766.

The western provinces, with 49.2 per cent. of the total mileage had 24.75 per cent. of the total tonnage, Mr. Marshall's statement showed, eastern provinces with 50.8 per cent. mileage provided 75.25 per cent. tonnage.

British Columbia with 11.1 per cent of mileage provided 4.60 per cent of the tonnage, Mr. Marshall stated, and the Provinces with 9.6 per cent of the total mileage provided, 8.9 per cent of the tonnage. Ontario with 2.86 per cent of mileage provided 48.4 per cent of freight revenue tonnage.

LAND DRAINAGE—By W. L. Powers, M.S., Chief of Soils, Oregon Agricultural College and Experiment Station; Secretary Oregon State Drainage Association 1915-1920 and T. A. Teeter, B.S., Professor of Drainage and Irrigation Engineering, Oregon Agricultural College. First edition, 263 pages, 5 1/4 in. by 8 in. Cloth. Published by John Wiley & Sons, Inc., New York.

This book is one of the Wiley Agricultural Engineering Series edited by J. B. Davidson, Professor of Agricultural Engineering, Iowa State College. It is primarily a text book for students in agricultural engineering, but will also be useful to the student of general agriculture, to the practical farmer as well as the owner of wet, overflowed, marsh, swamp or alkaline land.

The list of references dealing with each division of the subject of Land Drainage, would alone make it worthy of a place in every drainage engineer's library, but in addition there is considerable new data presented in simple form in the text. Much of the original data deals with conditions found in Oregon, but the local material is chosen so as not to restrict its useful application to other areas.

This work is well prepared for use as a text book on land drainage. The subject has been developed largely as one in applied soil-physics, but is arranged in simple form and is divided into three parts, viz:

1. Field Drainage.
2. District Drainage.
3. Special Drainage Problems.

A series of questions are included covering the points dealt with in each chapter which will help the reader to crystallize into a clear-cut thought, the ideas presented on each phase of the subject. Clear diagrams and a most fortunate selection of illustrations assist materially in explaining the subject matter. The illustrations are also well chosen to show the advantages which follow land drainage when applied to the reclamation of arid or wet lands.

This work comes at an opportune time, when the United States Government is considering an appropriation of \$370,000,000 to be expended for the reclamation of arid, swamp and cut-over lands, and when a survey of conditions in Western Canada shows that before any great increased population can be secured in a large number of areas, considerable drainage work will have to be undertaken.

Considered from all angles, the authors, while presenting a book dealing with the fundamentals of land drainage, have at the same time added a valuable contribution to the work on this phase of agriculture and engineering.

MECHANICAL WORLD YEAR BOOK, 1922. Messrs. Emmott & Co., Ltd., of Manchester, have issued the Mechanical World year book which has now reached its 35th year of publication. It is filled with information that will be of interest to mechanical engineers everywhere. The present edition is larger than its predecessor by twenty pages and contains some new sections, such as that on pipes and tubes. A most complete buyers' guide is included which is printed in French, Russian, and Spanish languages and will be of great value indeed to people in the countries named, who are anxious to get in touch with British Manufacturers of all kinds of mechanical equipment. The hand book contains 268 pages, is bound in cloth, and sells for 2/6.

A STUDY OF THE EFFECT OF MOISTURE CONTENT UPON THE EXPANSION AND CONTRACTION OF PLAIN AND REINFORCED CONCRETE—By Torata Matsumoto. Bulletin 126 of the Engineering Experiment Station, University of Illinois, Urbana, Ill. Paper; 6 by 9 in.; pp. 29. Illustrated.

TRUE NET SECTIONS OF RIVETED TENSION MEMBERS—By C. R. Young, Associate Professor of Structural Engineering, University of Toronto. Section No. 5, Bulletin No. 2, School of Engineering Research, Faculty of Applied Science and Engineering, University of Toronto. Paper; 6 by 9 in.; pp. 12; illustrated.

OBSERVATIONS ON RAILROAD CONSTRUCTION AND RAILROAD BRIDGES—By Dr. J. A. L. Wadell, Consulting Engineer, New York City. Prepared for and published by the Chinese Railway Association. Paper; 5 1/2 by 8 1/2 in.; pp. 34. Text of a memorandum prepared for the Chinese Railway Association based upon an address delivered before that body. In it are discussed such matters as Effect of Curvatures and Gradients on Traffic, Improvements, Rolling Stock, Bridges versus Tunnels, Best Kind of Bridges for China, Bridge Approaches, Specifications and Contracts, and many other matters of interest to railway and bridge engineers.

STATEMENT RESPECTING FINDINGS AND OTHER STATEMENTS CONTAINED IN THE MAJORITY REPORT OF THE COMMISSION APPOINTED TO ENQUIRE INTO THE SUBJECT OF HYDRO-ELECTRIC RAILWAYS IN ONTARIO. Observations on the Report by Sir Adam Beck, Chairman, Hydro-Electric Power Commission of Ontario. Paper; 7 by 10 in.; pp. 43; Map.

This brochure contains criticisms of the majority report of the Sutherland Commission with respect to many contentious matters pertaining to Hydro-radials. In it an effort is made to show that the conclusions of the commission were unjust and unwarranted.

ST. LAWRENCE PROJECT IN ABEYANCE

IT IS generally believed that the St. Lawrence Power and Navigation scheme will be held up for an indefinite period. It is understood that the Canadian Government while cordially in favor of the project, does not wish to bring it up in parliament at the present time owing to the prevailing financial conditions. As far as the United States is concerned, it is understood that President Harding has decided that a reciprocity treaty with Canada should precede any St. Lawrence waterway legislation by congress.

BUSINESS OUTLOOK IMPROVES

IT IS reported from Hamilton, Ont., that the outlook for business has improved considerably and that a more optimistic feeling prevails in manufacturing circles. The Dominion Sheet Metal Products Co. is now turning out about 75 tons of galvanized steel sheets daily and orders are being received from all parts of Canada. The Hamilton Bridge Works Ltd. have received orders for five new bridges for the T. & N. O. Railway for its extensions in the James Bay division. This order amounts to approximately \$175,000 and has resulted in additional men being re-employed and the east end plant resuming operations. The company has also received orders for the new grandstands at Scott Park, which amount to about \$25,000.

The Alberta Government contemplates appointing a chief commissioner for the new Highways Commission. A highly capable man is required and it is understood that the appointment will be made as soon as a suitable candidate is found.

MODIFICATIONS IN REINFORCED CONCRETE SPECIFICATIONS

WITH a committee of the Canadian Engineering Standards Association working on the preparation of a specification for concrete and reinforced concrete, attention is being directed in this country to the modifications proposed in the Joint Committee report. While the Canadian specification will no doubt have an individuality all its own, it cannot help but be influenced to a considerable extent by the prolonged and valuable labors of the Joint Committee.

The discussion which has arisen on this report during the few months since its release indicates that there are many contentious matters brought to the fore by it. Last December a two-day discussion occurred before the American Society of Civil Engineers in New York on the proposed specification, and a similar discussion took place at the recent annual meeting of the American Concrete Institute in Cleveland. The Committee which framed the progress report did not regard it as a final document but asked for criticism and suggestions, and these they have received in full measure.

The most criticized clause in the whole document is that referring to the methods of fixing the proportions for the concrete. Three suggested trial clauses covering this matter are framed; the first one providing that the proportions shall be fixed by the engineer from cylinder tests of the concrete, the second that the proportions are to be left entirely to the contractor who must furnish a concrete of a desired strength, and the third stipulating that the proportions shall be determined from a table of the Abrams' type appended to the specification. Quite naturally con-

tractors have generally opposed the second type of clause on the ground that the responsibility for forecasting the appropriate proportions should rest with the engineer who is presumably an expert in these matters. They point out that there is a considerable variation in the 28-day cylinder tests for materials that appear to be similar, and that if the suitability of the concrete is to be determined by such a test, cements giving high initial strength would invariably be used. Such cements, state the contractors, often give a concrete which ultimately is not so strong as that produced by a cement giving a low initial strength. Some construction interests also fear that the first clause suggested would also be onerous to the contractor in that it, in effect, merely transfers the testing from the contractor to the engineer. They allege that the 28-day test would often result in the condemnation of a concrete which would eventually be very satisfactory, and that no doubt many pieces of work have been constructed of concrete that would have been condemned had 28-day cylinder tests been made.

Other clauses on which the commercial interests have taken issue with the framers of the Joint Committee report are those debarring integral waterproofing and those fixing the allowable stress on rail-steel bars at 16,000 lb. per sq. in.

Objection has also been raised by the contractors' committees in New York and Philadelphia on the ground that buildings constructed under the Joint Committee tentative specification would cost more than buildings constructed under the ruling specifications in the larger cities of the United States. For example, it has been calculated that the cost of the steel and the concrete in a reinforced concrete flat slab building designed to the proposed specification would cost 11% more than for such a building designed in accordance with the New York Building Code, and that the cost would be 8% greater than the average cost under eight representative codes in the larger American cities. For a beam and girder building, however, the cost would appear to be some 10% less than the average cost of buildings constructed under these eight specifications. Naturally those who specialize in flat slab construction express opposition to the proposed regulations. It is pointed out, however, that the additional cost arises principally from the revised column specification which is very conservative as compared with similar provisions now in force. This clause, it will be remembered, takes into account the shrinkage of concrete during setting, the initial stress of the steel induced by this shrinkage and the flow of the concrete under load. Undoubtedly allowance for these various effects cause more expensive columns than have heretofore been used and the construction interests are not pleased at the prospect of telling owners that columns in buildings which they have now to erect must be heavier than have been used when many acres of buildings that have been entirely satisfactory have already been built to a much bolder specification.

It is anticipated that in the twelve months or more that may be devoted to the Joint Committee report a great deal of thorough discussion will be given to these and related matters. The facts brought out by such debate will no doubt serve as valuable suggestions to the Canadian Engineering Standards Committee now engaged in the onerous task of framing a representative specification for concrete and reinforced concrete applicable to this country.

FUEL HAZARD STILL EXISTS

ONCE more labor disruption in the coal fields of the United States brings to the attention of Canadians the desirability of a strong policy in the matter of fuel supply for this country. A year ago a Committee of the House of Commons conducted an investigation of the future fuel supply of Canada, obtaining extensive information on the subject and making certain recommendations to the House. So far as is known, no fundamental change in the manner of dealing with this situation has been brought about. Perhaps the improved conditions pertaining to the supply of

fuel which came about with the commercial depression have beguiled us into inaction and it may need a still more powerful stimulus than ordinary strikes to result in effective action.

The facts of the situation have often been stated, but do not appear to have sunk home as yet. At the investigation mentioned it was shown that in the acute fuel area extending from Montreal to a point just inside the boundary between Manitoba and Saskatchewan 94½% of the coal consumption for the year 1920, was reported. For the whole of Canada the importation of coal for the year 1920 was 20,816,000 tons, or 59% of the total consumption. Added to this there was a very considerable importation of coke amounting in value to almost five million dollars.

While it may be impracticable under present transportation conditions to relieve the situation by the use of coal from Nova Scotia or the Prairie Provinces there is a real remedy available in the acute fuel area through the further development of water power. Considering the average coal consumption required for power plants, big and little throughout the country, probably nine tons of coal per horse power year would be required. If the fuel saving for the Chippawa power development alone be computed there would be, assuming the entire 600,000 h.p. to be installed, an annual saving of over five million tons of coal, or approximately 25% of the importation into this country. If, added to this, the possible savings from other water powers in the acute fuel area be considered, it is seen that there is a real remedy for the coal situation and that a much to be desired commercial independence in the matter of fuel could be attained by the greater development of water power.

OBITUARIES

CHARLES E. FIELD, a veteran railway contractor, died at Brockville, Ont., on April 10, aged 86. Mr. Field was for years engaged in railway construction work in Western Canada in partnership with the late H. B. Abbott, and also built the first line of railway across the Island of Montreal.

CHARLES S. BOONE, the well-known dredging contractor, died in Toronto on April 11, after a long illness. Mr. Boone was born in Oakville, Ont., 67 years ago and at the age of 27 started in business as a dredging contractor in Toronto, later becoming president of the C. S. Boone Dredging & Construction Co.

EUGENE T. LUCEY, a prominent contractor of Yorkton, Sask., died at Fort Qu'Appelle. Mr. Lucey was born at Heming, Minn., and when a young man located in the South Quill Plains District. Later he became a contractor and built several bridges in the Province of Saskatchewan. He moved to Canora in 1914, but left in 1918 to reside in Yorkton.

PERSONALS

J. W. THOMPSON has been appointed road superintendent for Wainfleet Township.

ED. HAMEL has been recommended by the Public Works Committee for the position of assistant city engineer of Quebec.

BRIG.-GEN. W. M. B. KING, of Kingston, Ont., will be transferred to London as general officer commanding Military District No. 1. He was a contractor in civil life, and saw active service in the South African and European Wars. He has been in command at Kingston about two years.

ROBERT O. SWEZEY, well-known as a consulting engineer on forestry, hydro-electric and pulp and paper problems, has become a member of the recently organized investment banking firm of Newman, Swezey & Co., Montreal. Mr. Swezey, though giving considerable time to the new financial concern, will continue the practice of his profession.

R. E. CLEATON, president of Cleaton Co. (Canada) Ltd., and of Inventions, Ltd., Montreal, has returned to Canada to resume active charge of affairs of these companies, after having spent the last three years in England in connection with business interest which he has in that country. Inventions, Ltd., are the sales agents for the Rawlplug Co. of Canada, Ltd. The Cleaton Co. (Canada), Ltd., are manufacturers' agents, representing a number of prominent American and English lines of fuel-economy equipment.

GEORGE DEWAR MACDOUGALL, who was appointed last summer as chief engineer of the British Empire Steel Corporation, was born on September 26, 1873, at St. Peters, Cape Breton, N.S. He was educated in the Common School of Oxford, Cumberland County, N.S.; Pictou Academy, Pictou, N.S.; Dalhousie College, Halifax, N.S.; and McGill University, Montreal, where he graduated in 1895 with the degree of B.A.Sc. (with honors) in mechanical engineering. After graduation Mr.

MacDougall entered the employ of the Robb Engineering Co., Amherst, N.S. In November, 1895, he entered the employ of Geo. F. Blake Mfg. Co., East Cambridge, Mass., where he spent three years in the shop and engineering department. After a year with the Fore River Ship & Engine Co., Weymouth, Mass., as chief draughtsman on marine machinery, he joined the staff of the Edison Electric Illuminating Co., Boston, Mass., and in September, 1899, was placed in charge of power house design and erection. From February,

1900, to November, 1921, Mr. MacDougall was with the Dominion Iron & Steel Co. at Wabana, Nfld., as master mechanic and assistant manager of ore mines. He resigned from this position in order to become assistant chief engineer of the Lackawanna Steel Co., at Buffalo, N.Y., later becoming mechanical superintendent of that company. In January, 1904, Mr. MacDougall accepted appointment as mechanical superintendent of the Dominion Iron & Steel Co. at Sydney, N.S. Two years later he was appointed chief engineer of that company. From April, 1909, to November, 1910, he was superintendent of construction for the Canada Iron Corporation, Midland, Ont. In January, 1911, he rejoined the Dominion Iron & Steel Co. as mechanical superintendent, and in October, 1916, was appointed assistant general superintendent in charge of engineering and mechanical departments. In October, 1918, the Nova Scotia Steel & Coal Co., Ltd., obtained Mr. MacDougall's services as general superintendent, which position he retained until his appointment as chief engineer of the British Empire Steel Corporation upon the merger of the Dominion and Scotia companies. Mr. MacDougall is president of the Nova Scotia Mining Society, past president of the Nova Scotia Accident Prevention Association, vice-president for Nova Scotia of the Canadian Institute of Mining and Metallurgy, and a member of the Engineering Institute of Canada, the American Iron and Steel Institute, and the West of Scotland Iron and Steel Institute.

The name of the Barber Asphalt Paving Co. has been changed to the Barber Asphalt Co. Announcement is made by A. W. Sewell, president of the company, that the change involves no alteration in the organization or obligations of the company.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand or proposed, contracts awarded, changes in staffs, etc.

TENDERS PENDING

The following tabulation is presented as a reminder to contractors in regard to tenders that are still pending, other than those reported in this issue. The word "Issue" refers to the issue of "Canadian Engineer" in which there appeared a notice giving details regarding the call for tenders.

Place of Work	Tenders Close	Issue
Toronto, Ont., construction of pavements, curbings and sidewalks	Apr. 19	Apr. 11
Delia, Alta., erection of schoolhouse	Apr. 20	Apr. 4
Halifax, N.S., highway construction	Apr. 20, 22, 24 & 26	Apr. 4
York Tp., construction of watermains	Apr. 22	Apr. 11
Toronto, Ont., erection of church and rectory	Apr. 24	Apr. 11
Prince Edward Island, Province of, grading and concrete structures	Apr. 28	Apr. 11
Prince Edward Island, Province of, road materials	Apr. 28	Apr. 11
Pembroke, Ont., erection of hospital	May 9	Apr. 11
Ontario, Province of, various work on Provincial highways	May 11	Apr. 11

BRIDGES, ROADS AND STREETS

Alberta, Province of.—The appropriations for road work total \$1,520,000 this year, and \$600,000 will be available in addition for bridges. The Highway Department will definitely attempt to qualify for the Federal road grant Sections of main roads in different parts of Alberta will thus be entered for the Dominion funds, and it is expected that a substantial amount will be earned under this scheme.

Halifax, N. S.—Tenders, addressed to the Provincial Highways Board, will be received until noon, April 29, for the construction of three roads. (See official adv.)

Halifax, N. S.—A petition from the residents of Cape Sable Island, requesting the construction of a bridge to connect the island with the mainland, was presented to the house of assembly by Hon. E. H. Armstrong, minister of Public Works and Mines.

Hamilton, Ont.—Estimates prepared by Road Superintendent T. R. Allison of Wentworth County call for an expenditure of \$206,027 on road work this year.

Hamilton, Ont.—Reeve Ray, of East Flamboro, will request Wentworth County Council to take over the road surveyed through the Bolton farm, and which is intended as a link between the Waterdown road and the Provincial highway. Estimated cost of work, \$50,000.

Kingsion, Ont.—City Council voted \$75,073 for construction of pavements. It is probable that the city will spend upwards of \$150,000 on pavements this year. City Engineer, Howard S. Dick.

Lindsay, Ont.—Victoria County Good Roads Board plans an expenditure of \$175,000 this year. New machinery will be purchased. Road Superintendent, E. L. Miles, Lindsay.

London, Ont.—H. A. Brazier, city engineer, states that the supply of Portland cement and broken stone required by the city during the current year will be purchased on the open market.

London, Ont.—Contract has been awarded to the United States Asphalt Refining Co., New York, for supply of refined asphalt and road oil for the current year. Tenders received were as follows: Asphalt delivered in packages,

Imperial Oil Ltd., Toronto, \$29.30; Texas Co., New York, \$27.34; Barber Asphalt Co., Philadelphia, \$31.32; United States Asphalt Refining Co., New York, \$23.38; Sun Co. of Canada, Toronto, \$23.95. Asphalt delivered in tank cars—Imperial, \$29.30; Texas, \$19.37; Barber, \$27.47; U. S. Asphalt, \$19.06; Sun, \$19.80. Light asphaltic road oil (140,000 Imp. gal.)—Imperial 11c; Texas, 9.6c; Johnson Oil Refining Co., Detroit, 11c; Sun, 9.5c; Crescent Oil Co., Hamilton, 11.5c; U. S. Asphalt, 8.05c. Medium asphaltic oil (30,000 Imp. gal.)—Imperial, 11c; Texas, 8.39c; Johnson, 11.5c; Sun, 9.5c; Crescent, 11.5c; U. S. Asphalt, 8.05c. All prices are in Canadian funds, f.o.b. London.

Montreal, Que.—Tenders, addressed to the civic executive committee, for the supply of about 4,000 tons of inorganic stone dust, will be opened at the City hall at noon, April 20.

Niagara Falls, Ont.—Contract awarded to the Dufferin Construction Co., Toronto, to build 6 miles of stone road from Green's Corner to the Welland canal, and work has started.

Oakville, Ont.—Pavements will be constructed on the following streets: Allen, Chisholm, Church and Brant. Clerk, Percy A. Bath.

Ontario, Province of.—Construction work will be resumed on the provincial highways in the vicinity of Hamilton, within the next few weeks, it was announced recently by Hon. F. C. Biggs, Minister of Public Works. Contracts for the Brantford highway, the Hamilton-Winona road and the Binkley subway have been let and the work will be gone on with as soon as the ground is in a workable condition.

Ottawa, Ont.—A large delegation waited upon Premier King and other Government ministers on April 11 to urge the importance of the construction of a bridge between the city of Montreal and the south shore of the St. Lawrence River. The delegation asked the Government to vote \$50,000 to pay the expenses of a commission of engineers to take soundings and report on the feasibility of the project. If this is done, the Government will be asked to authorize the Montreal Board of Harbor Commissioners to issue bonds to cover the cost of construction, the Government guaranteeing these bonds. Premier King in reply stated that all the arguments put forward would receive the most careful consideration of the Government.

Pembroke, Ont.—A movement is on foot for linking up the thirty miles of road lying between Pembroke and Mattawa, as yet unfinished, of the highway running between Mattawa and North Temiskaming.

Queenston Heights, Ont.—Tenders will be received by John H. Jackson, Superintendent, Queen Victoria Niagara Falls Park Commissioners, Niagara Falls, Ont., until 12 o'clock noon, May 24, for the sub-grading and construction of 4,100 ft. of macadam roadway, 24 ft. wide. (See official adv.)

St. Thomas, Ont.—Tenders will be received by W. C. Miller, city engineer, until noon, April 28, for the construction of pavements. (See official adv.)

South Vancouver, B.C.—A delegation of property owners from the district bounded by 25th and 34th avenues and Knight Road and Fraser Street, headed by Mr. Hall, presented to the council a petition asking that a by-law for paving the roads through this area, extending about eight miles, be submitted to the said owners. Estimated cost, \$123,000.

Stratford, Ont.—Contract awarded to W. L. Malcolm Co., Kingston, for \$57,000, for the construction of approximately 32,000 sq. yds. of concrete base for pavement and

approximately 22,000 ft. of combined concrete curb and gutter.

Toronto, Ont.—Advisory Commercial Committee of Board of Education decided to donate to the city a piece of land south of Dewson St., on condition that the City Council straighten Dewson St. and construct a pavement and sidewalks.

Toronto, Ont.—City Council intends to construct concrete sidewalks on Clendenan Ave., Coxwell Ave., Evelyn Ave., Glendonwyne Road and Glenholme Drive at a total estimated cost of \$16,280; also concrete curbing on Fawcett Ave.

Toronto, Ont.—Plans of the proposed new Gerrard St. bridge over the Don were submitted to the Public Works Department at Ottawa for approval. Tenders will be called for as soon as the approval of the Department is obtained. Estimated cost, \$750,000.

Toronto, Ont.—Toronto & York Roads Commission has awarded contract to the Warren Bituminous Paving Co. of Ontario, Ltd., for two miles of work at Sharon; to R. H. Blackwell, of Toronto, a bridge at Richmond Hill, and to Ben Bees, of Newmarket a bridge at Mount Albert, Ont. E. A. James, Engineer.

Unionville, Ont.—Contract for grading the Markham-Whitchurch townline has been awarded to William Faiza, 43 Scott St., Toronto, at 29¢ per cu. yd. The Engineers are James, Proctor & Redfern, Ltd., of Toronto.

Victoria, B.C.—Extension of the Island Highway, from Forbes Landing, was urged upon the Provincial executive council by a delegation from Sayward district. The matter will be considered by the Department of Public Works. Estimated cost of the 40-mile extension, \$250,000.

Wainfleet Tp., Ont.—Council passed by-law appropriating \$9,350 for roads. Road Supt., J. W. Thompson.

Welland, Ont.—Tenders will be received until May 1, addressed to Robert Cooper, Clerk of Welland County, for the construction of 15½ miles of 9-ft. waterbound macadam road, 1¼ miles of 16-ft. water-bound macadam and 2 miles of bituminous penetration road. Plans and specifications may be seen at the County Clerk's office at Welland.

West Hill, Ont.—The Ontario Bridge Co., Ltd., Toronto, who have the contract for the Highland Creek bridge on the provincial highway which is being built here on the Kingston road section of the provincial highway, have the work well under way, excavation being practically finished and material on the ground ready for concreting the foundations.

WATER, SEWAGE AND REFUSE

Halifax, N.S.—City Engineer F. W. W. Doane recommended sewer extension on South St., between Queen and South Park Streets, at a cost of \$7,200. Works Committee approved report and sent it on to City Council.

Kitchener, Ont.—Six-in. water mains will be laid on Louisa St., Dane St. and Crescent St. Mains will also be laid on Victoria and Mount Hope Streets. Superintendent of Water Commission, Mr. Pequegnat.

Montreal, Que.—City Council adopted a resolution favoring the construction of three incinerators.

Montreal, Que.—The construction of three incinerators will be considered by the Public Works Commission. President, Ald. Carmel.

Niagara Falls, Ont.—Tenders were received until April 13 by C. M. Border, architect, for the erection of a pump house for the Water Commission.

Niagara Falls, Ont.—Water Works Commission approved plans prepared by Architect Border for the proposed new "booster" pumphouse for the South end. Tenders will be called.

Ottawa, Ont.—City Council intends to construct 9-in. tile pipe sewers in Harmer Ave. and Lyndale Ave. City Clerk, N. H. Lett.

Petrolia, Ont.—Tenders addressed to John McHattie, Secretary, Water Commission, will be received until 5 p.m.,

May 1, for the supply and construction of steel reservoir, foundation and pump. (See official adv.)

Seaforth, Ont.—Contract has been awarded for the reservoir, pump-house and dwelling to B. & N. Planing Mill Co., Milverton, Ont., and the contract for the elevated tank to the Hunter Bridge Co., Kincardine Ont., James, Proctor & Redfern, Ltd., 36 Toronto St. Toronto, are the Engineers.

Sydney, N.S.—City Council plans installation of several sections of sewer.

Toronto, Ont.—Works Committee approved of sewers being laid on Courtleigh Boulevard.

Toronto, Ont.—City Council intends to construct a sewer in Mount Pleasant Road, from Heath St. to St. Clair Ave., at a cost of \$5,450.

Toronto, Ont.—Ald. Burgess introduced a motion that the Works Commissioner bring in a recommendation to pave Annette St., from Runnymede to Jane St.

York Tp., Ont.—Water mains will be laid on Coxwell Ave.

York Tp., Ont.—Engineer R. O. Wynne-Roberts has requested the Toronto Waterworks Commission to report on the feasibility of supplying the east side of the township with 100,000 gallons of water per day. The allotment is 25,000 gallons, and this has been overdrawn to 50,000, but 100,000 gallons are required.

LIGHT, HEAT AND POWER

Calgary, Alta.—Tenders will be received at the office of J. M. Miller, city clerk, until 1 p.m., April 27, for the supply of an electric arc welding outfit.

Kingston, Ont.—Scheme is under way for supply of Hydro power to Ernesttown, Kingston and Pittsburg Townships.

Mimico, Ont.—Town Council passed by-law authorizing the raising of \$25,000 for Hydro extension purposes.

Port Credit, Ont.—The Council passed by-law authorizing the issue of debentures for \$20,000 for Hydro extension purposes. It is proposed to extend the present system within the town limits.

Windsor, Ont.—Transportation Committee of City Council recommended that the Hydro-Electric Power Commission of Ontario be asked to construct an auxiliary steam plant here.

Winnipeg, Man.—Tenders will be received at the office April 17, for the supply of labor and material required for the construction of conduit runs and manholes. Specifications may be obtained at the office of the Hydro-Electric Department, 55 Princess St.

RAILWAYS

Galt, Ont.—A new joint station for the Grand River and Lake Erie and Northern Railway is to be built on Main St. this summer.

Kitchener, Ont.—Contract for laying of King St. east extension of Kitchener and Waterloo street railway has been awarded to the Standard Paving Co.

London, Ont.—A movement is on foot for the construction of a Union Station. Address Mayor Wilson.

Ottawa, Ont.—A bill providing extension of time for the construction of branch railway lines in Saskatchewan and Alberta by the C.P.R. was before the railway committee of the House recently and was ordered reported. It provides for the construction of three branch lines: from the Manitou Lake branch northwest through Lloydminster to Whitford Lake, Alberta; from near Asquith to Cloan, Sask.; from near Rosetown, Sask., to a point on the Pheasant Hills branch near Keppell.

Regina, Sask.—Delegates have been named by the Boards of Trade of Prince Albert, Melfort and The Pas to go to Ottawa to urge the completion of the Hudson Bay Railway.

Toronto, Ont.—Work will start shortly by the Toronto

Transportation Commission of the construction of a double-track line from Sunnyside to the Humber.

Toronto, Ont.—The Transportation Commission, it is expected, will commence the season's construction work toward the end of this week. The first section of track to be reconstructed will be that portion of King St., between York and Church Streets.

Victoria, B.C.—Mr. Cameron, Vancouver Island representative of the C.N.R., has been instructed to submit a report to Ottawa on the proposed 10-mile extension of the Island railway, to connect the line with the James Logging Co., on Cowichan Lake. Premier Oliver is urging an early start on the work.

Windsor, Ont.—Newhall Construction Co., formerly known as the Marble & Palmer Co., has been awarded contract for the greater portion of the program of construction work which the Michigan Central Railway will undertake this year.

FACTORIES AND LARGE BUILDINGS

Acton, Ont.—Erection of a \$100,000 tannery warehouse is planned by Beardmore & Co. of Toronto.

Bathurst, N.B.—The opera house was complete destroyed by fire. Loss, \$50,000.

Belleville, Ont.—American Optical Co. of South Bridge, Mass., has decided to erect a Canadian plant in this city.

Belleville, Ont.—City Council has authorized Board of Education to erect a school in Coleman Ward to be known as "King George School," at a cost of \$120,000.

Birch Cliff Heights, Ont.—Tenders for the erection of a Public School, including excavation, masonry, stonework, structural steel, steel stairs, steel sash, roofing and sheet metal work, carpentry, electric wiring, lath and plastering, painting and glazing, terrazzo work, plumbing, heating and ventilating, will be received by Burden & Gouinlock & Carter, Architects, 101 King St. West, Toronto, until 5 p.m., Wednesday, April 19. Plans and specifications may be obtained at the office of the architects, or information at the Township Offices.

Brigewater, N.S.—Tenders, addressed to James A. Curll, town clerk, for the erection of a Fire Hall, and also a separate tender for the plumbing and heating, will be received until 4 o'clock p.m., Monday, May 8.

Calgary, Alta.—Contract for construction of home for mental defectives awarded to Thomas, Jamieson & McKenzie, of this city, for \$165,604.

Calgary, Ont.—Separate School Board sold an issue of debentures amounting to \$20,000 for the construction of an addition to St. Anne's School in East Calgary.

Edmonton, Alta.—Contract for erection of \$20,000 building for James McDougall awarded to the Permanent Construction Co.

Edmonton, Alta.—By-law will likely be submitted to the ratepayers providing for the construction of a new market building at a cost of \$16,000.

Edmonton, Alta.—A three-storey block will be erected on 101st St. by Willard Kitchen at a cost of \$60,000. Architects, G. H. MacDonald and H. A. Magoon.

Edmonton, Alta.—Authority for a large extension to the Miseriordia Hospital is being asked, and it is expected that work will commence shortly. It is proposed to build an extension north of the present structure at an estimated cost of approximately \$250,000.

Edmonton, Alta.—Library Board has requested city officials to submit by-law to the ratepayers providing \$37,500 as additional funds for a new library building. City has already received a grant of \$37,500 from the Carnegie Foundation. Chairman, Mr. Barclay.

Edmonton, Alta.—A permit has been taken out for a garage to be built at the corner of 100th St. and 102nd Ave. by the Empire Loan Co., of Winnipeg, the estimated cost being \$15,000. It will be occupied by the Lines garage, Lees, Bigler & Moore are the contractors.

Fredericton, N.B.—Contract for erection of factory here on the Chestnut Canoe Co., Ltd., awarded to Thomas S. Miles, Devon, N.B.

Fredericton, N.B.—Tenders will be received until 12 o'clock noon, April 15, for the moving and repairing of a building at the York County Municipal Home, according to specifications to be seen at the Secretary-Treasurer's office, Fredericton; Town Clerk's office, Devon; and Fred Seymour's store, Nashwaaksis.

Fort William, Ont.—Tenders addressed to R. E. Mason, architect, Fort William, will be received until 5 o'clock, Thursday, April 27, for construction of Crawford Ave. Public School.

Grande Prairie, Alta.—Prominent Chicago financiers are considering the construction of an oil refinery here. Address John Gorman, city engineer.

Guelph, Ont.—A new building is to be erected to replace the present Brooklyn Sunday School building. Cost, \$20,000.

Guelph, Ont.—Contract awarded to the Yates Construction Co., of Hamilton, for construction of Collegiate Institute and Technical School, the contract price being \$262,524. This price is to cover all the construction with the exception of plumbing, heating and ventilating, the contract for which was awarded to W. G. Edge & Co., of Ottawa, for \$53,925. These prices do not include a swimming pool, but this may be included later. Building will be of reinforced concrete.

Hamilton, Ont.—Contract awarded to W. H. Cooper for the construction of a Masonic Temple. Estimated cost, \$300,000.

Hamilton, Ont.—Contract for construction of three more sections to grandstand in Scott Park awarded to Hamilton Bridge Works Co. by Parks Board. Estimated cost, \$16,500.

Hamilton, Ont.—The erection of a hotel on the Dynes property at Hamilton Beach is under construction. Address Beach Commissioners Col. J. J. Grafton and James Crooks.

Hamilton, Ont.—Contract let to W. H. Copper for the erection of an addition to "The Towers," the former Tuckett residence, which was recently acquired by the Ancient and Accepted Scottish Rite. The addition will cost \$150,000.

Kenora, Ont.—Board of Education plans erection of 4-room school at cost of \$25,000.

Lachine, Que.—Board of Railway Commissioners has approved plans for a new railway station to be erected by the city. Work will be started shortly.

Lindsay, Ont.—Sharpe & Horner, of Toronto, have been appointed architects for the proposed additions and alterations to the Collegiate Institute. Estimated cost, \$60,000.

London, Ont.—The Board of Education's expansion program, approved at the March meeting, calls for the erection of an 8-room school on the Dakin and Price St. property; purchase of sites for a public school in West London, for another in East London and for a collegiate in the East End; also improvements and additions to the Technical School equipment.

Mitchell, Ont.—Erection of new High School is projected.

Montreal, Que.—Church of the Sacred Heart, destroyed by fire, will be rebuilt, work to start shortly.

Montreal, Que.—Contract awarded to Anglin-Norcross Ltd., for construction of medical building on southwest corner of Guy and Sherbrooke Streets. Building will be ten stories high.

Montreal, Que.—Tenders will be called this week by the Protestant Board of School Commissioners for the erection of a school in Notre Dame de Grace. Estimated cost, \$350,000. Architect, Kenneth C. Rea.

Montreal, Que.—Catholic School Commission has purchased site for school and sisters' residence in the Parish of St. Anselme, on Forsyth St. Estimated cost of school, \$156,000. The residence will cost \$45,000.

Moose Jaw, Sask.—Work will commence within the

next few weeks on the construction of the new building for the Dominion Express Co.

Newmarket, Ont.—Newmarket Arena Co., Ltd., will build a rink on Cedar St., at a cost of \$30,000. Plans have been prepared by O. E. Tench.

New Westminster, B.C.—Plans are under way for rebuilding the Brunette sawmills, destroyed by fire.

North Bay, Ont.—Plans for the erection of a police station are being prepared. Clerk, William N. Snyder.

Oakville, Ont.—Erection of a new school on site of Central School is projected. Chairman of School Board, William Busby.

Oshawa, Ont.—Tenders, addressed to Dr. F. L. Henry, 28 King St. East., Oshawa, Ont., will be received until noon, Monday, April 24, for the construction of a Maternity Wing to the Oshawa Hospital. Work consists of concrete, masonry, carpentry, plumbing, heating and wiring. Plans and specifications may be seen at the office of the Hospital Treasurer Bank of Montreal, Oshawa.

Ottawa, Ont.—The new Ottawa Arena will cost, it is expected, somewhere in the neighborhood of \$200,000.

Ottawa, Ont.—St. Luke's Church, at Somerset and Bell Streets, will be torn down this spring and replaced by a large brick church. Architect, C. M. Dewit.

Owen Sound, Ont.—Preliminary plans for the proposed addition to the Collegiate Institute have been completed.

Peterboro, Ont.—By-law granting fixed assessment of \$20,000 to the Western Clock Co. was passed by ratepayers. Work on the new plant on Hunter St. east will be started at once.

Quebec, Que.—Building permit for \$55,000 has been issued to the Catholic School Commission.

Quebec, Que.—Public Works Committee let contract to J. H. Fontaine for construction of refrigerator in St. Sauveur, for \$10,160.

Quebec, Que.—Permit issued to the Canadian Royal Engineers for rebuilding that part of the Government Arsenal which was damaged by fire recently. Cost, \$24,000.

Quebec, Que.—Plans for construction of 4-storey building in rear of City Hall to contain three safety vaults, were submitted to Public Works Committee by City Engineer Baillarge. Estimated cost, between \$25,000 and \$30,000.

Quebec, Que.—Redemptorist Fathers will build a rectory on Grande Allee, and members of St. Patrick's church will erect a building connecting the rectory with the church and construct a sidewalk along the parish property on De Salaberry St. Address, Col. J. S. O'Meara.

Richard's Landing, Ont.—Practically the whole business section of the village was destroyed by fire, including the post office.

Rimouski, Que.—Tenders for the construction of the Rimouski Agricultural School will be called shortly by the Provincial Department of Agriculture.

St. Mary's, Ont.—Hurlbut Shoe Co. plans addition to plant.

St. Thomas, Ont.—The installation of an entirely new heating and ventilation system at Myrtle street public school at an estimated cost of between \$6,000 and \$7,000, was recommended to the internal management committee of the Board of Education by Donald Stewart, consulting heating engineer, of Windsor and Hamilton.

Saskatoon, Sask.—Contract for the new chemistry building at the University of Saskatchewan will be awarded to Bennett & White, of Calgary, at a price around \$100,000.

Saskatoon, Sask.—Following contracts have been awarded in connection with the erection of new Chemistry Building at University of Saskatchewan: General contract, Bennett & White Construction Co., Calgary, Alta., \$427,652; plumbing and heating, Green & Litster, Winnipeg, \$153,700; and electrical contract, Wheaton Electric Co., Saskatoon, \$20,930.

Simcoe, Ont.—Board of Education requested Town Council to issue debentures to provide \$100,000 for 6-room addition to south school and erection of 8-room school in north end.

Sharon, Ont.—Division of school section No. 3, of East Gwillimbury, Township and erection of a new school on Cemetery Hill, is proposed.

Straford, Ont.—Separate School Board awarded contract to John Hayman & Son, Ltd., of London, for construction of school, for \$62,300.

Straford, Ont.—Work is to be commenced shortly on the erection of a large Sunday School building in connection with Memorial Baptist Church. The plans call for the erection of a thoroughly modern brick building, two stories high.

Toronto, Ont.—Plans and specifications are to be prepared and tenders called for erection of Moose Hall on Heintzman Ave. Sec.-Treas., Bro. R. M. Ferguson.

Toronto, Ont.—Construction program of the Separate School Board already approved for this year calls for an expenditure of \$356,000. Other work may be approved shortly.

Toronto, Ont.—Bulk and separate tenders will be received until 5 p.m., April 21, for the erection of St. Saviour's Parish Hall, Swanwick Ave. Plans and specifications may be obtained from Mr. Loffree, 99 Main St.

Toronto, Ont.—It is stated that plans have been drawn for a 10-storey building for the Robert Reford Steamship Co. on property near Wellington and Bay streets. This will probably involve the use of between 400 and 500 tons of structural steel.

Toronto, Ont.—Tenders, addressed to W. W. Pearce, Business Administrator and Secretary-Treasurer, Board of Education, 155 College St., will be received until Wednesday, May 3, for the following trades for Riverdale Branch Technical School, Greenwood Ave.:

(1) Masonry, including concrete work; (2) cut stone; (3) structural steel; (4) ornamental iron; (5) steel sash; (6) plastering; (7) roofing and sheet metal work; (8) carpentry work; (9) marble and tile and terrazzo; (10) mastic flooring; (11) painting and glazing; (12) plumbing; (13) heating and ventilating; (14) heat regulation; (15) Refrigeration; (16) hydraulic ash hoist; (17) dumb waiter; (18) electric wiring; (19) local phones; (20) programme and time clocks.

Specifications may be seen at the office of the Architect of the Board, 155 College St.

Vauxhall, Alta.—Tenders will be received by the Board of Trustees of School District No. 4053, at the office of Harry V. Rounds, Sec.-Treas., Vauxhall, until noon, May 1, for the erection of a school building.

Victoria, B.C.—Contract let to Luney Bros., Sayward Building, for alteration on the Vernon Hotel block for the F. W. Woolworth Company's new store. Work was started. Cost, \$60,000.

Weston, Ont.—By-law providing for the raising of \$115,000 for additions to High School will be submitted to ratepayers.

Windsor, Ont.—Windsor Council, Knights of Columbus, plan erection of club house. Architect, John R. Boyde, Windsor.

Windsor, Ont.—Board of Park Commissioners awarded general contract for construction of clubhouse in Wigle Park to the John V. Gray Construction Co. The cost will be \$8,500. R. Paddon & Co. secured the plumbing contract at \$1,160.

MISCELLANEOUS

British Columbia, Province of.—Railway Committee of the House of Commons, Ottawa, approved an extension of time to the Burrard Inlet Tunnel and Bridge Co. in which to carry out the work authorized in 1910. The company was incorporated for the purpose of constructing a tunnel under the first narrows of Burrard Inlet and a bridge over the second narrows for foot passengers, steam and electric railways. The bill granting the extension provides that the work must be completed in five years and that 15% of the amount of the capital stock must be expended on the work within two years.

The Canadian Engineer

A Weekly Paper for Civil Engineers and Contractors

Mechanical Stresses in Transmission Lines

Chart Developed Applicable for any Ice and Wind Loading and Any Temperature for Horizontal Spans of 100 to 1500 ft. and Supports at Same or Different Elevations — Chart Only for Copper Wire

By E. MAERKER

Fargo Engineering Co., Jackson, Mich.

ENGINEERS dealing with transmission line problems have long felt the need of a simple comprehensive chart applying to all cases which are liable to come up. Transmission line calculations pertaining to mechanical stresses are very lengthy and cumbersome and require constant checking in order to avoid errors.

Many tables and diagrams have been published by various writers, usually based on a maximum loading of the wire of $\frac{1}{2}$ in. of ice at zero deg. F., combined with a wind pressure of 8 lb. per sq. ft. of projected area. The chart devised by the writer and presented herewith as Fig. 3. may be used for any ice and wind loading at any temperature, the horizontal distance between supports ranging from 100 ft. to 1500 ft., and the supports being either level or at different elevations. The chart can be used only for hard-drawn copper wire, this being the only restriction. With a different material such as aluminum, steel, etc., all

physical constants will change and a new set of curves will have to be drawn. Similar charts can, of course, be constructed for other materials.

While taking account of practically all variations, the writer has endeavored to make the construction of this chart as simple as possible, so that it may be read by the average trained engineer. The

Fig. 1—Changes in Length of Wire Due to Tension and Temperature

construction is based on the nomographic type, and the various scales are so arranged as to minimize inaccuracies due to reading.

The chart enables the engineer to string the wire with a certain tension at stringing temperature in order to prevent the tension from exceeding the allowable limit at a low temperature, and, on the other hand, to keep the sag or deflection in the wire within the required limits at a high temperature.

Notation

- Let a = area of the wire in square inches,
 W_w = weight per foot of bare wire in lb.,
 W_1 and W_2 = resultant forces acting on the wire in lb. per ft. of wire,
 T_1 and T_2 = tension in wire in lb.,
 P_1 = tension in wire in lb. per square inch,
 l = horizontal distance between supports in ft.,
 d = vertical distance between supports in ft.,
 L_1 and L_2 = length of wire in ft.,

h_1 and h_2 = sag or deflection of wire from midpoint of line joining supports to wire at midspan in ft.,
 e_1 and e_2 = elongation caused by tension in wire,
 m = .0000096, coefficient of linear expansion,
 E = 16,000,000 lb. per sq. inch, modulus of elasticity
 t = temperature in degrees, F.

Assume a wire suspended between two rigid supports, as in Fig. 1. Evidently this wire undergoes a change in length with a change in temperature or a change in loading. The effect of a temperature change is always partly counterbalanced by the effect of the resulting change in tension. A rise in temperature will stretch the wire and increase the sag. This increased sag in turn will lessen the tension and cause a shortening in the length, provided this takes place within the elastic limit of the wire. The algebraic sum of these changes will be the actual change in the length of the wire. A fall in temperature will cause the wire to shorten and decrease the sag, which in turn will increase the tension and elongate the wire. An increase in loading will result in an increase in tension and elongation in the wire and vice versa.

Development of Equations

When a wire be cut to length L .

When suspended this length will change to L_1 due to the stretch in the wire. Furthermore, let a change of temperature and loading take place and elongate the wire to length L_2 . (See Fig. 1). From L_1 we have to subtract e_1 , the elastic change, to get the original length L , and from L_2 we subtract $mL_2 t$, and e_2 , the temperature change and the elastic change to obtain L , or $L = L_1 - e_1 = L_2 - mL_2 t - e_2$, and transposing,

$$L_1 (1 + mt) - e_1 = L_2 - e_2$$

To evaluate e_1 and e_2 , we employ the fundamental formula, Modulus of elasticity, E = Unit stress / unit strain

$$= (T_1/a \div e_1/L_1) = (T_2/a \div e_2/L_2)$$

The above equation then becomes,

$$L_1 (1 + mt - T_1/aE) = L_2 (1 - T_2/aE) \dots \dots \dots (1)$$

According to the parabolic law, a line drawn tangent to the curve and parallel to line AB, in Fig. 2, will meet the curve at point D midway between supports. The lowest point of the wire is at a distance x from point D. The vertical component $T \tan v$ at point D must be equal to Wx , or

$$x = T \tan v / W = Td / Wl$$

Fig. 2—Mechanical Characteristics of Stressed Wire

By taking moments A, and simplifying it is found that

$$h = Wl^2/8T$$

which is equivalent to the maximum sag for level supports.

The length of wire for level supports is expressed as follows,

$$L = 1 + Wl^2/24 T^2$$

The length of the wire in Fig. 2 is made up of segments AC and BC, which when added together give as the total length of wire

$$L = 1 + (Wl^2/6T^2) \left\{ (1/2 + x)^2 + (1/2 - x)^2 \right\}$$

Substituting for x, the value Td/Wl from above and simplifying,

$$L = \left\{ 8 (1^2 + d^2/2) / 3l \right\} \left\{ \frac{3}{8} + h^2/(1^2 + d^2/2) \right\}$$

As seen from this equation, the length of a wire for sup-

ports at different elevations differs from the length for level supports by the term $d^2/2l$.

Substituting the value of L with proper subscripts in Eq. (1), we have

$$h_1^2 E / (1^2 + d^2/2) - \left\{ \frac{3}{8} + h_1^2 / (1^2 + d^2/2) \right\} (T_1/a - E m t) = h_2^2 E / 1^2 + d^2/2 - \left\{ \frac{3}{8} + h_2^2 / (1^2 + d^2/2) \right\} T_2/a \dots (2)$$

Equation (2) is a general equation and the various constants for the particular material of which the wire is composed may be substituted in it and a chart drawn up.

Applying the formula to hard-drawn copper wire, $E = 16,000,000$ and $m = 0.0000096$. The term T_1/a in Eq. (2) represents the tension per square inch and will be denoted by P_1 . For copper, the weight per foot of bare wire $W = 3.864 a$, or $a = W/3.864$, and since $T_2 = W_2 l^2/8h_2$, we may

FIG. 3—TENSION AND DEFLECTION CHART for Hard Drawn Copper Wire, Stranded or Solid, of Any Size, for Any Temperature Range and Any Ice and Wind Loading. Spans up to 1500 Ft. with Supports Level or at Different Elevations.

Modulus of Elasticity = 16,000,000; Coefficient of Linear Expansion = 0.0000096

$W =$ Weight per foot of bare wire.

Subscripts "1" refer to given quantities.

Subscripts "2" refer to quantities to be found, except in case of W_2 , which must be known

- * l and d are in hundreds of feet in the formulae.
- $P_1 = T_1/a$
- $h_1 = W_1 l^2/8T_1$
- * $K_1 = h_1/(1^2 + d^2/2)$
- * $R = W_1 l/W_2$
- * $h_2 = K_2 (1^2 + d^2/2)^{1/2}$
- $T_2 = W_2 l^2/8h_2$
- $x_2 = dl/8h_2$
- $D_2 = (d + 4h_2)^2/16h_2$

Example

Given . 250,000 c.m. hard-drawn copper wire stressed up to 4,725 lb. at zero deg. F. with 8 lb. of wind and $1/2$ in. of ice. Area of wire, $a = 0.19635$ sq. in. Weight of bare wire $W = 0.762$ lb. $W_1 = 1.788$ lb. $W_2 = 0.762$ lb.

Span $l = 800$ ft. Difference of elevations between supports, $d = 100$ ft.

Required: (1) Maximum vertical sag at + 120 deg. F. with no ice or no wind load; (2) Tension in wire; (3) Location of lowest point of wire.

Procedure: Compute P_1 , K_1 and R from above formulae and follow guide lines from 1 to 3. From K_1 , so found, compute h_1 , T_1 , x_1 and D_1 .

Results: (1) $K_1 = 3.90$. $h_1 = 3.90 (1^2 + 1/4)^{1/2} = 31.25$ ft.

(2) $T_2 = (0.762 \times 800^2)/8 \times 31.25 = 1,950$ lb.

(3) $x_1 = (100 \times 800)/8 \times 31.25 = 320$ ft.

$D_1 = (100 + 4 \times 31.25)^2/16 \times 31.25 = 101.25$ ft.

substitute for T_2/a in Eq. (2). If we also replace h_2/l by its approximate value $h_2/(l^2 + d^2/2)^{1/2}$, and we express l and d in hundreds of feet, and P in thousands of pounds per sq. in., we have after simplifying,

$$1,600 K_1^2 - (3570 + K_1^2) (P_1 - 0.1536t) \div 10 \\ = 1,600 K_1^2 - (3,750 + K_1^2) \times 0.483R/K_1, \dots\dots\dots (3)$$

where K_1 and K_2 represent $h_1/(l^2 + d^2/2)^{1/2}$ and $h_2/(l^2 + d^2/2)^{1/2}$ respectively and $R = W_1 l/W_2$

For the case where the supports are on the level K_1 and K_2 will be h_1/l and h_2/l respectively. Eq. (3) also applies if the pull on the horizontal support is in a horizontal direction or acting upward.

The chart shown in Fig. 3 was plotted directly from Eq. (3), only three operations being necessary starting from the left of the chart and working toward the right. One example with explanations is given on chart. The lowest point of the wire is most always at no ice and no wind loading, and for supports at different elevations this point is at a horizontal distance $x = Td/Wl$ from the centre of the span toward the lower support and the vertical distance $D = (d + 4h)^2/16h$ from the top support.

The chart shown in Fig. 4 gives the tension and sag for a 250,000-c.m. copper wire for different conditions of load-

FIG. 4—SAG AND TENSION CHART for 250,000 C.M. Hard-Drawn Copper Wire and 600-Ft. Span, Based on Maximum Tension of 5,900 Lb. at Zero F., 8-Lb. Wind and 1/2 In. Ice

ing and for a range in temperature from -30 deg. to +120 deg. F., the span being 600 ft. The maximum tension was based on 5,900 lb. at 0 deg. F. with 1/2 in. of ice and 8 lb. wind. The values were found from the chart of Fig. 3 and arranged on a tension and sag scale as shown. The boundary of the shaded area represents the limitation of tension and sag. It was assumed here that a wind pressure of 8 lb. per sq. ft. of ice-covered wire is not liable to occur at -30 deg. F., accounting for the upper corner of the diagram being chipped off. The ice limit curve is seen to run at 32 deg. F. until the curve of no ice is reached. From here the boundary line runs to 60 deg. F. and 15 lb. per sq. ft. of wind pressure and then connects to no ice and no wind curve at +120 deg. F. While a maximum tension of 5,900 lb. at 0 deg. F. was specified, it will be well to investigate the tension at the minimum temperature, especially if the span is short.

The chart of Fig. 5 shows the same wire with same conditions of loading for a 200-ft. span, but the tension at -30 deg. F. exceeds 5,900 lb. For this span the tension of 5,900 lb. should be based on 1/2 in. of ice with no wind at a temperature of -30 deg. F.

In transmission line work a uniform span between towers cannot always be adhered to on account of highway crossings, railroads, rivers, etc. For this reason a chart comprising various spans will be found very useful. Furthermore since the charts of Figs. 4 and 5 present a complete picture of the behavior of the wire under different

FIG. 5—SAG AND TENSION CHART for 250,000 C.M. Hard-Drawn Copper Wire and 200 Ft. Span, Based on Tension of 5,900 at Zero F., 8-Lb. Wind and 1/2 In. Ice

loadings, a chart with no ice and no wind loading will be more useful for stringing purpose, including, of course, the usual range of temperature.

Fig. 6 gives a chart which has been drawn up for the same wire and for spans ranging from 200 ft. to 1,000 ft., all based on 5,900 lb. tension at 0 deg. F. with 8 lb. of wind and 1/2 in. of ice. This chart brings out a very important point, especially for lines where post type insulators are used and where the supports are rigid.

Coupling a 600-ft. span with a 200-ft. span, it is seen

FIG. 6—CHART FOR STRINGING WIRE—250,000 C.M. Hard-Drawn Copper Wire for Spans 200 to 1,000 Ft. Based on Tension of 5,900 Lb. at Zero F., 8-Lb. Wind Pressure and 1/2 In. of Ice

that at 120 deg. F. the tension for the 600-ft. is 2,465 lb. and for the 200-ft. span 2,350 lb., a difference of 115 lb. in favor of the longer span. At -30 deg. F., the 600-ft. span has a tension of 4,110 lb. and the 200-ft. span a tension of 6,400 lb., a difference of 2,290 lb. in favor of the shorter span. These 2,290 lb. represent a dead pull along the line

and too great a stress on the insulator and the supporting structure, especially if this particular tower should happen to be at an angle, in which case the insulator would have to bear the stress due to the angle in addition to the stress of 2,290 lb. as mentioned above.

It will be noticed here that although a maximum of

FIG. 7—CHART FOR STRINGING WIRE — 250,000 C.M. Hard-Drawn Copper Wire for Spans 200 to 1000 Ft. Based on Tension of 5,900 Lb. at Zero F., 8-Lb. Wind Pressure and 1/2 In. Ice for Spans 600 to 1000 Ft. Inclusive, and Tension of 3,250 Lb. at + 30 deg. F., with no Wind and no Ice for Spans 200 to 500 Ft. inclusive.

5,900 lb. was specified at 0 deg. F. with ice and wind, the tension for a 200-ft. and 300-ft. span at - 30 deg. F. with no ice and no wind is exceeding this value and the computation for these two spans would have to be altered.

Since unequal spans cannot be avoided in transmission lines, the absolute pull along the line can be lessened materially. This is accomplished by reducing the tension in the shorter spans, i.e., by altering the assumed basis of maximum loading. From the chart of Fig. 6 it will be noticed that for a 600-ft. span at + 30 deg. F. the tension is 3,250 lb. Producing this + 30 deg. F. temperature curve horizontally to the left and rectifying all curves to the left of the 600-ft. span, the stress will be distributed more equally. Accordingly, the new basis to work from for all spans less than 600 ft. is a tension of 3,250 lb. at + 30 deg. F. with no ice and no wind.

The chart of Fig. 7 shows this rectification of spans from 200 ft. to 500 ft. If we attempt to couple a 200-ft. span with a 600-ft. span, we find that at - 30 deg. F. a difference of $4,880 - 4,110 = 770$ lb. in favor of the short span and at + 120 deg. F. a difference of $2,465 - 1,545 = 920$ lb. in favor of the long span, against a former difference of 2,290 lb. The maximum tension for the 200-ft. span computed from the new basis would be 5,520 lb.

In conclusion, it might be said that the chart submitted gives all necessary information to the engineer in the field for stringing wire according to the best engineering practice.

BRITISH TOWN PLANNING CONVENTION

DELEGATES from thirty-six countries attended a Town Planning Convention held in London, England, recently, under the auspices of the International Garden Cities and Town Planning Association. The various Dominions of the British Empire sent delegates, and the Canadian contingent included representatives of Quebec, Ontario, British Columbia, and Nova Scotia. Among the countries directly interested in the conference were Japan, Palestine, China and the new Irish Free State. Belgium, with sixty delegates, had the largest representation outside of Great Britain.

Ebenezer Howard, president of the Association, in welcoming the visitors, made special reference to Belgium, which he complimented on the way in which it had met the replanting and rehousing in the areas devastated by the war. He also referred to France as having done excellent work in its devastated districts. President Howard said that in the Overseas Dominions, the town planning and garden cities movement was growing stronger every day.

MILLION-VOLT SINGLE TRANSFORMER

ENGINEERS of the Westinghouse Electric & Manufacturing Co., Pittsburgh, Pa., announce the construction of the highest-voltage single transformer ever built. With capacity of 1,000 kv-a., it is capable of delivering 1,000,000 volts above ground, and was built for the Westinghouse experimental laboratory at Trafford City, Pa. It is said to be the only single transformer of such high above-ground voltage ever built.

The transformer is built on the principle of distributing electrostatic stress as developed by C. L. Fortescue, of the Westinghouse Co., about eight years ago. The terminal bushing is the largest ever built in the Westinghouse shops, and on this account special machines had to be fitted to turn it. Its length is 19 ft., and it is 41 1/2 in. in diameter and weighs about 9,000 lb. The static shield is 10 ft. in diameter and 20 in. deep.

The construction of this high-voltage testing transformer is the result of research work by Westinghouse engineers. The company states that it has made research a feature of its activities, believing that such work must necessarily precede commercial progress in any line. This has been practically true in the matter of the gradual increase of transmission voltage. Testing facilities capable of producing voltages four or five times as great as the transmission voltages are necessary in connection with development work on insulators and apparatus.

Some testing in the past has been done at voltages approximating 1,000,000 volts, but these tests were accomplished by connecting two transformers in series, grounding the connection between them and using the voltage between line terminals. One million volts was produced first in this way by the Westinghouse Company in 1913. When conducting tests by this method, an artificial ground is used which is one-half of the test voltage below ground. Results obtained by this method, however, are said to be rather questionable, even when conducted with great care. Much more reliable tests, state the Westinghouse engineers, can be made by means of a single transformer capable of delivering the full test value above ground.

Work on the Great Falls hydro-electric plant, 186,000 h.p. capacity, being built by the Fraser-Brace Co. of Montreal, for the Manitoba Power Co., is progressing rapidly. Excavations for the power site are almost completed and by the end of the present month the work of pouring concrete will be started.

SEWAGE DISPOSAL FOR SMALL MUNICIPALITIES

Report of Committee on Sewage and Sanitation Presented at the Convention of American Society for Municipal Improvement, Baltimore.

CHAIRMAN John F. Skinner of the Committee on Sewerage and Sanitation has furnished "The Canadian Engineer" with the following report which is intended to cover villages and small cities.—EDITOR.]

One principle only may be postulated which will apply to all cases, viz.: Each situation is a distinct problem to be studied and solved truthfully, always remembering that the truth upon any subject is obtained by marshalling all the facts in their proper relations. In view of the above it may be helpful to outline the data to be considered, the conclusions therefrom, the resulting type of plant applicable, the elements of disposal plants and certain observations.

Data to be Considered

(1) Physical Conditions

- A. Area of Territory
 - (a) Present
 - (b) Future
- B. Character of Territory
 - (a) Compact or scattered
 - (b) Residential, commercial or industrial
 - (c) Flat or hilly, gentle or steep slopes
 - (d) Low, requiring pumping, or high, allowing gravity outfall
 - (e) Geology, sand, gravel, clay, quicksand, rock
- C. Population, Density and Total Numbers
 - (a) Present
 - (b) Future
 - (c) Resident
 - a. home and business
 - b. home only (commuters)
 - (d) Non-resident (industrial)
 - (e) Seasonal (summer colony)
 - (f) Transient (summer resort)

(2) Sewerage System

- A. Character of Sewer System
 - (a) Separate
 - (b) Combined
- B. Amount of Sewage
 - (a) Dry weather flow
 - (b) Maximum flow (obtained by):
 - a. Amount of water supply and population.
 - b. Sewer gaugings
 - c. Proportion of storm water admitted in case of combined system
 - d. Precipitation, run-off data, per cent impervious, etc.
- C. Character of Sewage
 - (a) Domestic waste
 - (b) Industrial waste
 - a. Solids
 - b. Color
 - c. Odor
 - (c) Ground water
 - (d) Street wash (in case of combined system), quantity of manure, leaves, grit, etc., received through surface sewers
 - (e) Settleable and suspended solids with their settling rates
 - (f) Effect of various precipitants, especially in the case of preponderating trade wastes
 - (g) Oxygen demand, putrescibility

(3) Body of Water Receiving Effluent of Plant

- A. Non-potable, no bathing
- B. Salt water with beaches to protect
- C. Tidal stream, bathing
- D. Fresh water lake
 - (a) Bathing

- (b) Water supply
- E. Fresh Water Stream
 - (a) Large or small
 - (b) Riparian uses
 - (c) Industrial uses
 - (d) Bathing
 - (e) Water supply
- F. State regulations regarding discharge of sewage
- G. Currents — dilution and dispersion
- H. Deep or shallow
- I. Constant or variable level
 - (a) Fluctuation due to tides
 - (b) Fluctuation due to precipitation
 - (c) Fluctuation due to storage
- J. Temperatures — water and sewage
- K. Wind — prevailing direction and intensity
- L. Vegetation
- M. Pollution other than by this effluent
- N. Protection of fish, oysters, etc.
- O. Visual and aerial nuisance
- (4) Funds Available for Sewage Treatment

Conclusion From the Data

(1) Volume of Sewage to be Treated

- A. Dry weather flow — present and future
- B. Maximum flow — present and future
- C. Distribution — through day and week

(2) Character of Sewage

- A. Variation in density
- B. Solids — settleable and suspended
- C. Oxygen Demand — putrescibility
- D. Color, odor, etc.

(3) Character of Treatment Indicated

- A. Discharge into non-potable water
 - (a) Remove floating and coarse suspended objects
 - (b) Remove grit where necessary to prevent deposits in stream, lake or long outlet pipe
- B. Discharge into small non-potable stream
 - In addition to (a) and (b) above treat further sufficiently to prevent nuisance
 - (c) Remove settleable solids and 40 to 90% of suspended solids by tank treatment
 - (d) Oxidize effluent
- C. Discharge into large potable stream or lake where there is ample dilution and oxidation. Treat as in (a) (b) and (c). (c) may be omitted if the effluent does not appreciably affect the receiving body of water
 - (e) Disinfect the effluent when sewage pollution, possible from the effluent, can be detected near bathing beaches or water works intakes
- D. Discharge into small potable stream or lake
 - Treat as indicated in (a) (b) (c) and (e) above.

Type of Plant Applicable

The above operations may be accomplished respectively by means of the following devices:

- (a) Remove floating and coarse suspended objects, by coarse racks, fine racks or mechanical screens
- (b) Remove grit, by detritus chambers
- (c) Remove settleable solids and 40 to 90% of suspended solids, by tank treatment with or without precipitants
- (d) Oxidize effluent, by irrigation, sand filtration, contact beds, trickling filters, or aeration or activation
- (e) Disinfect the effluent, by liquid chlorine or bleach

Elements of Disposal Plants

(1) Removal of Solids

A. Screening devices

- (a) Coarse racks, bars 2 in. to 4 in. apart for large objects in combined sewage
- (b) Fine racks: Bars $\frac{3}{4}$ in. apart for coarse floating and suspended matter in fresh sewage, when followed by tank treatment
- (c) Fine mechanical screens: For coarse floating and suspended matter, particularly in the case of stale

or septic sewage when followed by further treatment. The removal is mainly garbage. Also where no further treatment is required, as above in Section 3-A and C.

B. Detritus chambers: For the removal of grit and heavy (mainly inorganic) solids which will settle from a stream flowing at a mean velocity of one foot per second. This should precede fine racks or screens; more important for combined sewage

C. Tanks: For the removal of settleable solids and 40% to 90% of suspended solids

- (a) Septic tanks, 8 to 12 hours detention
- (b) Biolitic tanks
 - a. Agitation chamber 6 to 8 hours detention
- b. Settling chamber 2 to 3 hours detention
- (c) Imhoff tank
 - a. Flow chamber—3 hours mean detention for best removal
 - b. Digestion chamber—4 to 6 months sludge
- (d) Settling tank—3 hours mean detention with continuous removal of sludge for separate digestion, with or without precipitant

(2) Oxidation of Effluent

- A. Dilution in lake or streams
- B. Broad irrigation: Only applicable under unusual conditions of isolation and cheap land
- C. Sand filters: Only applicable where large areas of natural sand and gravel are available in suitable location
- D. Contact beds: For locations so close to habitations that the spray from sprinklers would cause nuisance.
- E. Trickling filters of broken stone or brush. This is probably the best known method of artificial oxidation of tank effluent. When carefully designed and constructed they have been uniformly successful on well settled sewage which does not contain unusual elements, trade wastes, etc. They are expensive to construct but cheap to operate. They should be followed by settling basins for secondary sludge.
- F. Aeration or activation: The process known as "Activated Sludge" produces a well oxidized effluent by means of agitation and thorough mixing of sewage, air and previously aerated sludge. It is a plant relatively cheap to install but most expensive to operate. It requires less area than any other artificial method of oxidation but it is limited to situations where cheap power is available where fertilizer can be produced as an offset to the expense of operation and upon a large scale. Certain adaptations still in the experimental stages offer promise of success.

(3) Disposition of Solids

- A. Screenings
 - (a) Incineration
 - (b) Composting for fertilizer
 - (c) Treated as garbage
 - a. Buried. b. Burned. c. Reduced.
- B. Grit: Dumped for filling
- C. Sludge
 - (a) With or without digestion
 - a. Dumped in deep water or discharged during flood conditions
 - b. Lagooned or dried in furrows and covered
 - (b) With digestion—drained on drying beds and used
 - a. For fertilizer
 - b. For fertilizer base
 - c. For filling

(4) Disposition of Effluent

- A. Direct into receiving body of water
- B. Through long conduit to avoid local pollution
- C. Chlorination where necessary with
 - a. Liquid chlorine or
 - b. Bleach.
- To Protect
 - (a) Water supply

- (b) Shell fish
- (c) Bathing beaches.

Observations

There are certain details in the construction and operation of disposal plants which are too often overlooked, as they are generally omitted in the literature of the subject.

Provide the plant, where necessary, with:

1. Water under pressure
2. Industrial railway
3. Light
4. Heat in building for cold weather
5. Repair shop with forge, pipe cutter, stock and dies, and bench tools
6. Laboratory apparatus
7. Power for the above and other uses
8. Labor under competent supervision.

The moving of sludge, grit and screenings is often most conveniently accomplished by an industrial railroad preferably operated by storage battery locomotives, as this method obviates the danger of exposed trolley wires.

In fortuitous situations like two of the present and two of the future plants of Rochester, N.Y., power is obtained from the fall of the sewage and fuel is only used for heating, otherwise it must be provided and becomes an important element in the expense of the plant.

A certain amount of labor may be effectively employed in hosing and washing down decks and walls, skimming tanks, agitating scum in gas slots by streams or by the use of tampers to prevent the formation of a continuous crust and afford free vent for the gas.

Labor is also required in operating gates, removing sludge, grit and screenings; raking over the surface of trickling filters when the first "ponding" appears, inspecting and cleaning spray nozzles daily as well as the distributing and collecting pipes. Such operations are most certainly performed when a methodical schedule is maintained and directed by a responsible man on the job.

Flies in large numbers are disgusting around a disposal plant and can be largely avoided by reasonable precautions. As they come to obtain food, they can be discouraged by keeping all surfaces washed clean and by barring floating solids from quiescent water in tanks. In the relatively rapid current of a detritus chamber in advance of screens, it is only necessary to keep the walls washed clean. Grit from a properly operated detritus chamber will not attract flies, neither will well digested Imhoff sludge, whether wet, spadeable or dry.

Fine screens and efficient scum boards, hosing and occasional skimming will minimize the floating solids in a settling tank, or reduce them to such size that they will not support a fly. Screenings attract flies as they are largely composed of garbage. They should be covered with grit, earth or ashes or compacted and sprinkled with borax solution.

Small moth flies which are found in warm weather on and above a trickling filter come from the larvae resident on the stones just below the surface. They do not travel far from the filter and are not objectionable. They may be kept out of other portions of the plant by screening doors, windows and other openings, and by providing curtain walls dipping below the surface of the sewage.

Odors. The best plan is to surround the plant by a large tract of land municipally owned and controlled, but even then certain odors which reach to considerable distances, may produce nuisance unless controlled.

Well digested Imhoff sludge is not objectionable and can be noticed only in the immediate neighborhood. Odor from screenings can be controlled by covering as suggested above. Liquid sewage when undisturbed does not give much offense, but when it is broken up in rapid currents by means of baffles, or tumbled over weirs, it becomes more noticeable.

Odors have been found objectionable at distances of half a mile when sewage is blown into the atmosphere as spray, by air under pressure. This nuisance does not occur

when the wind direction is unfavorable, nor yet when there is perfect quiet. A strong wind or good breeze does not seem to cause trouble to leeward for the water is too attenuated when mingled with a considerable volume of air. Smells seem to be carried further with a scarcely perceptible drift of the air. The remedy for this condition consists in covering so that rising spray or vapor will impinge upon the under-surface of the cover and be condensed.

At the main (Irondequoit) sewage disposal plant of Rochester, N.Y., where the total cost, including the site of 315 acres on the shore of Lake Ontario, was \$975,500, and where 45 feet head is available most of the time, the cost of accessories such as water works, railroad, grading, light and power was \$108,000. In general such accessories, including equipment of shop and laboratory, may amount to 10 or 15% of the cost of the plant.

AMERICAN WATER WORKS ASSOCIATION

ANOTHER successful convention is anticipated when the American Water Works Association meets at Philadelphia on May 15-19, 1922, both dates inclusive. The following tentative program which has been arranged, includes the following papers. Monday, May 15, will be devoted to registration, group and committee meetings, and presidential address.

Tuesday Morning

1. Business Section.
Report of Publication Committee.
Report of Finance Committee.
2. G. W. Fuller—Philadelphia Water Supply, Present and Proposed.
3. F. C. Jordan—Fire Prevention and Fire Protection in Relation to Public Water Supply.

Tuesday Afternoon

1. J. Waldo Smith—Development of the Schoharie Watershed—Catskill Water Supply.
2. M. M. O'Shaughnessy—Hetch Hetchy Water Supply.
3. John H. Gregory—Tentative.
4. Wm. A. McGraw—The Construction of the Loch Raven Dam.
5. G. E. Willcomb—Twenty Years Filtration Practice at Albany.

Tuesday Evening

A.W.W.A. Manufacturers' Program

1. Peter Payne Dean—Short paper on Dean Control Valves, with moving pictures.
2. Thomas F. Wolf—Underground Leakage and its Relation to Mains and Services.
3. John Oliphant—Pneumatic Pumping, Up-to-Date.

Wednesday Morning

1. Report of Committee on Standard Forms of Contract.
2. Report of Council on Standardization.
3. Report of Committee on Industrial Wastes in Relation to Water Supply.
4. Report of Committee on Watershed Protection.
5. George R. Taylor—Problems in the Reforestation of Watersheds.

Wednesday Evening

1. J. W. Ledoux—Some Observations Concerning Wood Pipe.
2. Report of Committee on Standard Specifications for Cast Iron Pipe and Specials.
3. C. E. Inman—Experience with Cast Iron Water Pipe for Pressures Higher than Allowed by Standard Specifications.
4. Peter Gillespie—Centrifugally Cast Iron Pipe (with slides).

Thursday Morning (Superintendents' Day)

1. L. H. Enslow—Water Chlorination Control in Virginia.
2. Report of Committee on Physical Standards for Distribution Systems.
3. M. M. Borden—Air and Relief Valves.
4. Wm. P. Mason—Instances of the Value of a Sanitary Survey.

5. F. A. McInnes—Causes of Failure of Cast Iron Pipe.
6. Topical Discussion, Breaks in Water Mains.

Thursday Afternoon

1. George E. Cripps—Equipment and Shop Facilities for Maintenance of Water Works Systems.
2. Topical Discussion.
3. W. R. Conard—Present Day Tars for Pipe Coating.

Chemical and Bacteriological Section

1. Report of Committee on Standard Methods of Water Analysis.
2. Report of Committee on Colloidal Chemistry in Relation to Water Purification.
3. Report of Committee on Testing Water Works Materials and Supplies, Lime Specifications.

Thursday Evening

1. S. T. Powell—Industrial Water Supplies.
2. David A. Decrow—Reciprocating Pumps.
3. S. P. Felix—Turbo-centrifugal Pumps.

Friday Evening

(Joint Session with Chemical and Bacteriological Section)

1. Frank E. Hale—Plant Control of Chlorination by the Excess Chlorine Method as Employed in New York City's Water Supplies.
2. W. W. Brush—Responsibility of the Water Works Superintendent to Prevent Tastes and Odors due to Microscopic Organisms.
3. W. A. Sperry—Further Notes on Chlorine Control at Grand Rapids.
4. Norman J. Howard—Recent Practice in the Removal of Odors by Aeration, Filtration and other Processes.
5. Wm. J. Orchard—Recent Developments in Chlorination

Friday Afternoon

1. Report of Committee on Meter Schedules.
2. T. A. Leiken—Steel Pipe.
3. G. A. Elliott—Steel Pipe.
4. Wm. A. Megraw—Design, Construction and Operation of a Balancing Reservoir.

Chemical and Bacteriological Section

Symposium on Tastes and Odors

1. From Sewage Pollution.—Leader.
2. H. E. Jordan—The Effect of Wastes from Oil Refineries upon the Operation of the Filter Plant at East Chicago.
3. From Chlorine Treatment.—Leader.
4. F. H. Waring—Tastes and Odors from Decomposition and Putrefaction of Organic Material in the Maumee River Water.
5. George C. Bunker and Henry Schuber—Reactions of Culture Media.
6. Norman J. Howard—Chlorination Prior to Filtration, with Special Reference to Efficiency, Economy and Removal of Excess Chlorine.
7. Edward Bartow and G. C. Baker—Water Softening by Base Exchange.

CALL FOR NOMINATION CARDS

C. D. BROWN, Walkerville, Ont., Secretary of the Canadian Section of the American Water Works Association, is very anxious that the Canadian members should return their nomination cards to him as soon as possible. An effort is being made to send out the program for the forthcoming meeting at Brantford along with the nomination blank in the same envelope. In order to do this the nomination papers will have to be printed by May 1, and for that reason it is most important that the nomination cards be returned to Mr. Brown at the earliest possible date.

DEVELOPMENT IN PAVEMENT CONSTRUCTION*

No Outstanding Changes in Major Methods of Construction — Developments in Details — Curing Concrete Base — Treating Gravel and Sand-Clay Surfaces

By Charles M. Upham
North Carolina State Highway Engineer.

NO GREAT changes have been brought about or new methods introduced in the construction of modern type pavements during the past two years, but rather energy has been expended in the development of many details, which had previously proven to be hindrance in economical road construction. With the present character of road materials, and the mechanical devices now in use, the types of pavements seem to have become established and to have settled within distinctive limits.

For years, roads have consisted of the grading, the construction of the drainage structures, and the surfacing. There have been no great changes in grading other than the more careful selection of materials, and the few mechanical improvements for handling rock and earth. Drainage structures have for a long period been built of wood, steel, rubble or concrete masonry. Road surfaces have consisted of soil, selected soil, or metal composed of artificial aggregates held together with some kind of binding material.

The only recent changes have been in the discovery and development of details, and the methods of handling aggregates. The building of macadam roads marked a great change in highway construction, and for a long time macadam was universally adopted as the standard road surface, since it satisfactorily met the needs of traffic at the time. A few inventions such as the steam roller and the stone crusher assisted the development of road construction at the early part of this period. With the change of traffic demands it was found that this type of macadam, as then built, was inadequate in many instances, and consequently road builders began to devise new surfaces to withstand the new classes of traffic. The result has been that present-day standard pavements are still undergoing changes and developments and, while recent years have seen very few radical changes in the principal characteristics of road surfaces, developments in the details of construction have been numerous, and it is impossible to mention more than a few of the most important ones.

Developments in Construction Details

The construction of half-width roads can hardly be called recent, although they have given satisfactory results. This method of road construction releases traffic from the long rough detours and renders the road available for traffic during construction. The method has been utilized satisfactorily in the construction of bituminous pavements, and, in a few instances, in the construction of water-bound macadam, but it is generally used in concrete road construction. Where this type of road is constructed for heavy duty it is often heavily reinforced, each half of the road being kept separate from the other half, so that the complete pavement really consists of two strips, laid side by side. In this method of construction the heavy reinforcement is longitudinal, on account of the center line joint taking up the vertical movement of the pavement, thus eliminating longitudinal cracking, and the transverse cracking is decreased to a minimum, even in those sections of the country subjected to low temperature.

In other instances "tie roads" have been used to join the two strips of pavement together. This method, however, introduces difficult details in construction, and up to the present time has shown no particular advantage over the other. The practical advantage of the longitudinal joint lies in the fact that the construction joint is easily maintained, and is not objectionable in appearance, while

a jagged, irregular longitudinal crack is difficult to repair and is also unsightly. In some states this longitudinal or center line construction joint is provided, even though the pavement is constructed in one operation, the advantage being the same as when the pavement is constructed in two sections.

Another recent development in road surface is the widening out and the reclaiming of old macadam roads by building a strip of hard surface pavement on each side of the macadam. On either side of the old macadam road varying from 5 to 10 ft. in width, a strip of concrete is placed from 9 to 10 ft. wide; these strips being sometimes reinforced. This method gives a comparatively wide pavement, and makes a road useful which would otherwise be too narrow to be of any service to traffic.

Another development in road surfacing has been the general tendency to increase the amount of reinforcement in concrete roads.

In recent years many engineers were reinforcing their roads with metal wiring, approximately 25 to 27 pounds to 100 sq. ft. Now it is a common practice to use approximately three times this amount, with the tendency to still further increase the weight of material. Specifications of North Carolina for 1921 will undoubtedly call for metal amounting to nearly 100 pounds for each 100 sq. ft. The use of heavier metal has effected a large saving in the cost of roads. The present price of steel has made possible considerable saving in cost by the construction of thinner concrete pavements. Where reinforcement has been used in most cases the road has been constructed of a universal thickness, resulting in a considerable saving of concrete.

Batch Transfer Method

Much progress has been made in the methods of laying concrete pavements, the tendency being not to allow concrete materials to be placed on the subgrade. The batch transfer method which is now becoming a standard form of construction, has proven economical, in most instances, and capable of large yardage. There have been many combinations of this method, such as hauling by industrial railway with the batch boxes carried upon the railway trucks, truck hauling with the batch boxes loaded on the trucks, and trucks provided with batch compartments. In some instances the batches have been hauled a portion of the distance by trucks and transferred to an industrial railway. This has proven a very economical combination in many cases.

The central mixing plant for concrete pavements is now being used on many projects. In most cases the ready mixed concrete is hauled to the job by means of trucks. The only detail in this method which can be considered questionable, is the transferring of the concrete from the trucks, owing to the possibility of the aggregates becoming segregated. This trouble will, no doubt, be overcome, when this method of construction will gain in popularity.

Curing Concrete Base

In a few instances engineers are calling for a piece of bituminous surface road to be constructed of 1-2-4 concrete and requiring that the concrete base be properly cured for a period of at least two weeks. For a long time the curing of concrete pavements has been neglected, and it is only recently that this detail of construction has been given proper attention. One of the most important developments which has been brought about recently is the use of the burlap covering in the early curing of concrete surface. The finished pavement is covered with strips of burlap, approximately 4 ft. wide and extending the entire width of the pavement. This burlap is kept wet and then placed on the finished concrete surface from about 10 to 20 ft. back of the finishing operation; the slight marking of the surface from the burlap being negligible. The burlap should never be allowed to dry out, and thus the concrete does not lack the necessary water for hydration in the early periods, a condition which has often existed in the other methods of curing concrete roads. The writer considers that this is one

*Paper read before the American Association of State Highway Officials.

of the greatest developments, and one which has actually improved the lasting quality of concrete. As soon as the road surface becomes hardened the burlap is rolled up and ready for the next day's work, while the concrete road surface is covered with earth, sprinkled and wet in the usual manner.

Many specifications are now including regulations as to the riding qualities and evenness of the concrete road surface. Ordinarily this cannot be tested until the following day when the concrete has hardened sufficiently to bear one's weight. An appliance was invented recently which consists of an extremely light straight edge, which may be fastened to the end of two handles and extended over the road to test the surface before it has become hardened.

Many other experiments have been carried out for curing concrete pavements, but no definite results have been obtained. One state has used calcium chloride in solution applied on approximately one inch of earth covering. Another method tried has been the covering of the concrete surface with a heavy asphaltic oil. The oil was applied to the road in the proportion of about 6/10 gallon per sq. yd., and after the curing period of two weeks the asphalt was peeled off and again used.

Another extraordinary experiment has consisted of the oiling of the subgrade preparatory to laying the concrete, the object being to prevent mud forming during the light showers. It has been found that when the light truck is used, this oiling proves to be a considerable advantage; no doubt the oil offers some assistance to the stabilization of the subgrade.

New Construction Methods

While for a long time it has been customary to use wire fabric in the reinforcement of concrete highways, steel bars are occasionally used, and while there has been no development in regard to the use of this fabric reinforcement, there is, however, a change in the method of using steel bars. This new method consists of making a mat consisting approximately of 10 to 14 bars laid transversely, and about 5 bars longitudinally. The mat is then wired together and handled as sheet reinforcement.

The use of dowels at the transverse construction joint can hardly be considered new, because this method has been used for several years, and found to be very satisfactory in overcoming the tendency of one slab to rise above the other.

Another construction method is the installation of fibre conduits placed transversely across the road at various intervals, especially in small towns and villages. It is the function of these conduits to provide a means of laying gas, water and electric wiring across the road without breaking up the pavement.

In the construction of sheet asphalt surfaces there is a tendency to be more liberal in the grading of sand aggregates, and the use of a lower penetration asphalt. There is also a tendency to use a 3-wheel roller in compacting the sheet asphalt surface. While this is not absolutely new, its use has never been universal.

Another new development is a combination of a binder course and sheet asphalt surface in the one course, which virtually consists of a stone-filled sheet asphalt; the stone comprising from 25% to 60% of the entire surface. When this surface is used no binder course is laid, and the surface is compacted as an ordinary asphaltic concrete.

Recent developments in brick pavements have shown that the vertical fibre brick laid on a concrete base and sand cushion, grouted with a bituminous material is capable of withstanding the heavy traffic.

Progressive Type Road

The findings of the Subgrade Committee have shown that the traffic bearing properties of a pavement depend greatly upon the stability of the subgrade, and that the subgrade can be greatly stabilized by being mixed or covered with a non-capillary material, such as sand, gravel or top

soil. This has led to the development of what, in North Carolina, has been termed the "Progressive Type" road, which consists, first, of grading the road and building the drainage structures, and then surfacing with gravel, sand clay or top soil, which in effect, is nothing more than the construction of a subgrade for a hard surface pavement which can be constructed in the future. This can be maintained as a subgrade highway for medium traffic at a reasonable cost, and, when occasion demands, it can serve as a subgrade with high bearing value, for any type of surface desired.

Many states are situated similarly to North Carolina to the extent of having a large mileage of sand clay, top soil, or gravel surfaces. There has been much experimenting in the attempt to secure a bituminous material which would satisfactorily preserve this type of road surface. It has been generally found that a bituminous material sufficiently light to penetrate this surface would have practically no binding qualities, and that a bituminous material sufficiently heavy to have binding qualities would form a mat on the top of the road surface, and soon peel off, due to the dusting of the road surface directly underneath the bituminous covering. The weak point in this treatment was not in the bituminous blanket, but in the contact of the bituminous blanket with the road surface.

Treating Gravel Surfaces

North Carolina is attempting to develop a method which will correct this weakness, and provide a contact between the bituminous covering and the road surface. The method consists of softening the road surface by means of sprinkling and then rolling into this surface broken stone or gravel of approximately 1½ in. in size. After this has become thoroughly imbedded in the top soil or sand clay it is allowed to dry out, and subjected to traffic for a short period, after which it is swept clean by brooming. The road surface now consists of a single layer of crushed stone imbedded in the strong and rigid sand clay or top soil surface, and forms a satisfactory bond of contact for the bituminous material. Thus a sufficiently heavy material to have binding qualities can be applied to this sand clay road, and the layer of broken stone will prevent the dusting up of the road surface directly underneath the bituminous mat. By waterproofing the top soil or sand clay in this manner, a strong pavement is preserved and after the first application of the bituminous material a mat can be built by using various types of pavement. While this method has not been in practice long enough to prove its complete success, the developments show that for a slight expenditure, a sand clay or top soil road can be materially improved.

BRITISH RESEARCH IS AMBITIOUS

WHILE an increasing amount of electrical research work continues to be done by individual electrical engineering firms in Great Britain, co-operative research is being developed on an ambitious scale. The Research Association, formed by the British Electrical and Allied Manufacturers, is expending about \$40,000 a year for 5 years on this type of research, which is aimed at the benefit of all concerned in the electrical industry.

Practically every leading section of industry in Great Britain has its organized co-operative research association. In the case of brass, copper and other metals not containing iron, a great deal of very interesting research is now being carried on. The casting of brass, the influence of impurities on the working of copper, the electric melting of non-ferrous metals, and the grinding, jointing and polishing of such metals are being closely studied.

Perhaps the most important part of this research lies in the investigation of corrosion. The production of rustless iron and steel has stimulated the brass and other industries to give attention to the causes of corrosion. It is stated that the examination of tarnishing which is the first stage towards corrosion, has already yielded very interesting results.

PLAN TO BUILD NATIONAL RESEARCH INSTITUTE

Research and the Problems of Unemployment, Business Depression and National Finance in Canada
National Research Institute Proposed

ONE of the serious drains on the strength of the Dominion of Canada is the annual loss of engineers, chemists, scientific farmers, and technical experts, whose training paid for by Canadians in Canadian schools and universities supported by Canadian public money, thus goes out to make foreign countries rich and place Canada further in their debt for foreign goods and services.

Monopolies of Knowledge

Monopolies of knowledge, that is, monopolies of special branches of technical knowledge, constitute one of the most powerful weapons of trade to-day.

Secret agreements, combines, trusts, and the ordinary method of "conspiracies in the restraint of trade," become very mild and impotent weapons when compared to such formidable instruments as, for example, a secret chemical formula that might be scribbled on the back of a calling card.

In the bloodless wars for international trade it is the armies of chemists and engineers that must be mobilized, drilled, and directed against the parapets of unknown scientific facts. Export duties, credit leagues, intelligence departments, persuasive salesmanship, and even the magic of a great flag, cannot win or cannot hold, for long, trade for a country whose producers are not armed with scientific knowledge of their work.

A great camera manufacturing concern in the United States is able to dominate its field in at least half the world because it knows more scientific secrets of that trade than anyone else.

Because, if a new concern started in opposition, it need only reach into its pigeon holes for some new formula, not otherwise convenient to exploit at present, by which to raise its product one step beyond the competition of the would-be rival.

So in steel-making!

So in the manufacture of electrical apparatus!

So in textiles!

So in chemistry!

So in agriculture!

So in every important branch of human industry!

So in Canada, as compared to other Nations, everyone of our industries is threatened and must ultimately fall under the thrall of foreign domination unless it keeps pace with the advances in technical knowledge.

So, unless we master all that is to be known regarding the nature and possibilities of our vast supplies of varied raw materials, Canadians must ultimately find themselves at the mercy of foreigners who know how to prepare our riches for purposes of commerce.

What Other Nations Do!

Fifty concerns in the United States retain research departments at costs ranging from twenty-five thousand dollars to two million dollars a year.

In England, France and Germany, the race for technical knowledge for purposes of trade gathers speed.

The mere digger-out of raw material gets the pay of a laborer.

The nation that can finish its raw materials trebles and quadruples its rewards.

The question is, shall Canada keep reasonably in pace with the modern movement? Shall Canada add to her natural possessions a superior knowledge of how to use them?

Can the needed variety of occupations for ambitious Canadian sons and daughters be maintained unless she does make place for such knowledge and encourages those who extend it?

Can the burdens of Canadian taxation and the evils of unemployment be off-set if Canada, in her struggle for

markets and for good returns on her wares, does not possess herself of the instrument of technical knowledge?

The Government Task

No Government should be expected to bear all the cost of discovering new scientific truths; that of course is paternalism. Most of the cost of this work must be left to private enterprise since it is by private enterprise that the new knowledge will be exploited, properties laid out, employees set to work, and production carried on.

But if every branch of Canadian enterprise starts independently in the pursuit of new scientific information, there is bound to be tremendous waste. Many duplicate laboratories would be required. Much over-lapping of effort would go on. In one laboratory time would be lost in proving or disproving what had already been learned in a laboratory somewhere else, and perfectly willing to share the knowledge.

A vast amount of energy and money would be wasted on ground work, instead of having the ground work done as far as possible in common and the money available for research concentrated on the really new effort. To discover a quite simple formula might cost so much for laboratory and men as to discourage the enterprise. A lack of organization would be, therefore, a drag on the wheel.

What Has Been Suggested

It has been suggested in such circumstances, that the universities should be mobilized. But this view has had to be abandoned, not merely because universities are scattered, a difficulty which might be overcome to some extent by subdivision of subjects, but because university routine cannot meet the requirements of the kind of research the business world needs, without damaging the usefulness of the university to its students.

It has been suggested that the scientific staffs attached to certain government departments, as for example the wonderfully efficient Department of Mines at Ottawa, or the food and drugs laboratory of the Department of Health, could satisfy this need. But the work, which is needed, cannot be done entirely by the Dominion Government. In many cases investigation can be carried out to the best advantage under one or more of the Provincial Governments, or under federal and provincial authorities in co-operation. Moreover it will often happen that the work cannot be completed as a practical and commercial success without calling on the financial and other help of the industries which are concerned. In all such cases the work lies outside the duties of any government department and should be directed by a body with greater independence and freedom from administrative duties.

Thus in England, in the United States, in Germany, and in Japan, the need for some central bureau of research to synthesize the efforts of its individuals has resulted in the establishment of state institutions equipped and endowed by public funds, controlled by Parliament only in regard to the amount of funds made available for its yearly work.

The Present Proposal

It is proposed that the Government of Canada should set aside \$500,000 to erect and equip a building at Ottawa to be known as "The National Research Institute," and that it should make an annual grant for the carrying on of research in the public interest.

In addition to this kind of work special confidential studies of commercial problems would be carried out for persons or corporations or trade guilds willing to pay the cost of such studies.

This organization would provide a Bureau of Standards, that is, a bureau for the making of delicate tests, measurements or analyses of standard articles of Canadian trade, a work for which Canada has now to depend largely on the services of foreigners.

In other words, instead of having to rely on the scattered and unorganized efforts of gallant and public-spirited investigators; instead of having her manufacturers send their money, as happened in at least one case, to a foreign

state institute to buy research, Canada would have her own central Bureau of Standards for Research.

Here, laboratories and a library would be maintained for public use and a continuous study of Canadian materials would be carried on. Here the results of ground work could be pooled and made available to anyone. Here the engineer or chemist might find the last word in common knowledge of a subject and so have a much better taking-off place for his own research.

Here would be men who might be employed, at cost, to make experiments for this concern or that, their finding in such cases becoming the property of the man or the firm or group of firms who paid the cost. Here the finest instruments and apparatus would be available for those who desired to send their experts to explore some branch of knowledge.

Here, in other words, the state would provide at cost, a common working place and a common repository of such new scientific knowledge as had been acquired at public expense. At the same time, secret discoveries made at the expense of private enterprise, would remain the property of their discoverers, so long as used in the public interest, the public at large benefiting by the stimulus to industry and employment which, in theory at least, follows the application of such private knowledge.

This is what has been done in foreign countries. This is what the Council of Scientific and Industrial Research believes should be done in Canada.

Questions to be Answered

Who knows the secret of exterminating wheat rust? No one. Yet by organized and perhaps long sustained research it can be discovered and meantime lack of this knowledge costs Canada and her farmers millions of dollars per year. Valuable work has been done on this subject under the Department of Agriculture and the Advisory Research Council, but much still remains to be done.

What should a black fox eat? How can this precious little fur-bearer be protected from the ravages of worms? — In the answer lies millions of dollars for Canada, and important steps towards the solution of the question have already been taken.

What use can we make of our tremendous supply of Helium? It was greatly needed during the war as a gas for filling balloons. It will not burn, and at war-time prices Canada is wasting \$50,000,000 worth every day of the week.

It is contained in our natural gas and escapes unused into the air. Can we find another use for Helium besides the filling of balloons? Here is enough money to wipe off our railway deficit. The Research Council has promoted the study of this question; the material is available; it is now a matter of finding uses, in times of peace, for this gas of which Canada can become one of the largest producers.

How can Canada be put into a position to meet its own heavy and increasing demands for fuel? How can the great supplies of lignite in the West and peat all over Canada be utilized for this purpose?

The study of these questions, begun by the Department of Mines at Ottawa and pushed on by the Advisory Research Council, has reached a point where success is in sight.

What practical way can be found of developing and using the enormous quantities of low grade iron ore that exists in Canada?

This, too, has received attention. Much has been done, though much remains to be done and the answer cannot fail to be of immense importance to this country.

What can be done with our straw?

What can be done with our sawmill waste?

What should be done with our liquor from sulphite mills?

What about making artificial fertilizers by the use of our waterpowers?

These are some of the problems awaiting Canada's Bureau of Standards and Research; problems which have en-

gaged the attention of the Advisory Research Council, with promising and even valuable results.

Who Is to Do This Work?

The Honorary Advisory Council for Scientific and Industrial Research consists of eleven of the leading scientists and experts of the Dominion. Not one of them is paid, but, at the invitation of the government, gives his scientific services to the public.

The Council has been in existence about four years, has developed its organization and has studied the whole field of Canadian resources and industries. It has found certain problems facing the Dominion which must be solved if the country's industrial development is to be furthered or even maintained. When it was convinced that a problem was one which might be solved, it selected a group of experts, or sometimes a single individual, and appointed them to carry out the work, arranging at the same time for the provision of the funds necessary for this purpose. In this way the various investigations were carried out by the men most competent to undertake them and under conditions most favorable for success.

It is this body of detached and disinterested men that sponsors the idea and requests the support of the Canadian public for a Bureau of Standards and Research at Ottawa.

From Bulletin issued by Honorary Advisory Council for Scientific and Industrial Research.

CANADIAN SECTION A.W.W.A. MEETING

WHAT WILL undoubtedly prove to be the most successful meeting of the Canadian section of the American Water Works Association is scheduled to take place at Brantford, Ont., on May 12 and 13. This is the third annual meeting of the Canadian section, the last convention having been held at Niagara Falls, Ont., last summer.

A new feature this year will be an exhibit of manufacturers' supplies and it is hoped that as many firms as possible will take space in the Chamber of Commerce rooms at the Kirby House, Brantford, where the exhibition will be held. A cordial invitation is also extended to all municipal officials, commissioners and councillors, etc., whether they are or are not members of the American Water Works Association. Norman D. Wilson, engineer for the Water Works Commission, Brantford, Ont., is looking after the exhibit of supplies, while C. D. Brown, of the Walkerville Water Works, Walkerville, Ont., and secretary-treasurer of the Canadian section, American Water Works Association, is arranging an interesting program of papers on technical topics.

One of the papers on the program is the "Control of Sewage by our Governments," by F. A. Dallyn, engineer for the Ontario Provincial Board of Health, while a paper on the "Treatment of Hard Water" will be presented by Wm. Gore, of Gore, Nasmith & Storrie, Toronto. The manufacture of de Lavaud cast iron pipe will be described by a representative of the National Iron Works Corporation Toronto, with lantern slides. A paper on "Filter Plant Construction" will be read by R. L. Dobbin, superintendent of Waterworks, Peterborough, Ont. This paper will be illustrated with lantern slides. A paper on the "Standardization of Hydrant Threads" will be presented by Norman D. Wilson, engineer for the Water Works Commission Brantford. The Austin Machinery Co. will give a moving picture exhibition of their excavators and backfillers in operation while another interesting exhibit will be that of the Thomson Meter Co., who will give an actual demonstration of freezing one of their new frost-proof, fool-proof meters.

In April 11 issue of the "Canadian Engineer," an error was made in the title of the author of the article on "Smoky Falls Development on the Sturgeon River." C. C. Irvine is assistant to the president and not president of the Spanish River Pulp & Paper Mills, Ltd., as stated.

NEW CEMENT SPECIFICATION, CANADIAN ENGINEERING STANDARDS ASSOCIATION

VALUABLE service to the construction industry has been performed by the Canadian Engineering Standards Association, in the preparation and issuing of a new standard specification for Portland cement. The first Canadian specification for this material was prepared by a committee of the Canadian Society of Civil Engineers and approved by that body in 1916. On the reorganization of the C.S.C.E. as the Engineering Institute of Canada, the Canadian Engineering Standards Association was in 1920 requested to take over and revise the E.I.C. Portland cement specification, together with that on concrete and reinforced concrete. A sub-committee on cement was accordingly organized in January, 1921, including representatives of the Canadian manufacturers as well as of large users of cement. The specification now issued is based not only on that of the E.I.C. but also on that of the American Society for Testing Materials and on the British Standard specification for Portland cement. Consequently, the new document may be regarded as taking into account the most modern developments of cement manufacture, testing and use, both on this continent and in Europe.

The new specification is brief so far as the body is concerned, containing only 23 clauses. These outline the chemical properties, physical properties, packing and marking, inspection and rejection. Following this, there are three appendices. Appendix I dealing with standard methods and apparatus for testing cement; Appendix II with recommended methods for sampling cement; and Appendix III with standard methods for the complete chemical analysis of cement. The more notable points of difference between former specifications and the present one are noted below.

Chemical Properties

According to the new specification, the insoluble residue shall not exceed 0.75% as compared with the 0.85% of the A.S.T.M. specification. Sulphuric anhydride is fixed at an upper limit of 2% as compared with 1.75% under the old E.I.C. specification and the present A.S.T.M. specification. The upper limit of magnesia is set at 4%, instead of 5% as under the A.S.T.M. requirements.

Physical Properties

Fineness is fixed by the requirements that the residue on a standard No. 200 sieve shall not exceed 22%. The E.I.C. specification prescribed that there should not be a residue of more than 8% by weight on a No. 100 sieve, or more than 25% by weight on a No. 200 sieve.

It is now provided that the initial set shall not be less than 30 minutes and that final set shall develop within ten hours. This is similar to the E.I.C. requirement, except that the stipulation that final set shall not occur in less than one hour is deleted. No distinction is made with respect to the apparatus employed for determination of set, as is done under the A.S.T.M. specifications where initial set shall not be in less than 45 minutes as determined by the Vicat apparatus, nor in less than 60 minutes as determined by the Gillmore apparatus.

While the E.I.C. specification provided for a tensile test of neat cement briquettes, the new specification is in agreement with the A.S.T.M. requirements in abolishing the neat cement test. The tensile strength requirements are the same as those of the A.S.T.M., but the strength of 1:3 mortar briquettes at 28 days is set at 300 lb. per sq. in., as compared with 275 lb. per sq. in. under the E.I.C. specification.

It is of interest to note that the specific gravity test is not mentioned. In this matter the specification differs from that of the A.S.T.M. which prescribes the method of making the specific gravity test, although it contains the provision that this test will not be made unless specifically ordered.

Packing

The weight of cement per bag is fixed under the new specification at 94 lb. although heretofore the Canadian

bag has contained but 87½ lb. It is of interest to note that the E.I.C. specification also fixed the weight per bag at 94 lb., but the cement companies continued to provide the 87½-lb. bag. It is now understood that the larger content will be provided.

Standard Testing Methods

Standard methods and apparatus for testing cement are very carefully outlined in the new specification. These are similar to the methods prescribed in the A.S.T.M. specification although a number of important departures and improvements are made.

Accuracy in determination of fineness is facilitated by arrangements with the Surveys Laboratory of the Department of the Interior and the Laboratory of the Department of Public Works, (Ottawa). For example, it is provided that standard No. 200 sieves shall be certified by the former laboratory as free from major defects. For the purpose of enabling users themselves to judge from time to time as to the condition of standard sieves in their possession, the Department of Public Works will furnish on payment a standardized sample of cement or other similarly graded material which gives a residue of 20 to 25% on a standard No. 200 sieve.

Mixing

New methods of mixing based on successful laboratory experience in Canada have been prescribed. The following paragraph dealing with this matter is of interest.

"The dry materials shall be weighed out, placed in a suitable metal mixer bowl (preferably enamelled) and intimately mixed dry with a steel spatula to a uniform color. The bowl and spatula shall be similar in form to those shown in Fig. 1, (not reproduced here—Ed.) the edges of the bent spatula blade being formed to fit the curved side of the bowl. The proper percentage of clean water of the specified temperature shall then be added. After an interval of one-half minute for the absorption of the water, the process shall be completed by vigorous stirring with the spatula, working the material back from time to time in the reverse direction by pressure between the back of the spatula and the side of the bowl. During these operations the bowl can with advantage be revolved if tilted slightly and held in the left hand. The mixing processes shall be continued for at least one and one-half minutes.

The temperature of the room shall be maintained above a minimum of 18 deg. C., and that of the mixing water shall be between 20 deg. C., and 22 deg. C."

In place of the standard spatula prescribed by the specification, it has been found in the laboratories of the University of Toronto that large spoons work very satisfactorily when the mixing is done in a metal bowl of a size such as that suggested in the specification.

Soundness

A new steam testing apparatus constituting an improvement over that provided in the specification of the A.S.T.M. has been recommended. Detail sketches of this equipment are included in the specification, so that anyone wishing to adopt it may have the apparatus made up without difficulty.

New photographs of parts of cement which for various reasons have failed under the soundness test are included in the specification.

Sampling Methods

Great care was exercised by the committee in devising satisfactory methods of sampling. The resulting regulations are entirely new and constitute a distinct improvement on anything heretofore published. It is provided that each test sample which shall contain not less than 8 lb. of cement and shall be made up of at least 16 individual samples, which must be taken from separate bags or packages. It is recommended that one individual sample shall be taken from every fiftieth bag, preferably at the point of loading and after loading has been completed. Individual samples are to be taken from the surface of the cement to the centre of the bag by means of a sampling tube 1 ft. 6 in. long, ¾-in. diameter at the small end and 1¼-in. diameter at the large

end. Methods of sampling are also outlined for cement in bulk or on conveyors.

Complete Chemical Analysis

A departure is made in this specification by including as Appendix III detailed outline of the recommended method for the complete chemical analysis of cement. This provides for the determination of all constituents instead of merely the four chemical characteristics covered by Appendix I, that is loss on ignition, insoluble residue, sulphuric anhydride and magnesia.

Personnel of Committee

The work of framing the specification was carried out by a Sub-Committee on Cement of the Sectional Committee on Cement and Concrete, of the C.E.S.A. The personnel of the Sub-Committee was as follows: Professor Peter Gillespie, (Chairman), University of Toronto; Professor J. Watson Bain, University of Toronto; Professor E. Brown, McGill University; E. Brydone-Jack, Department of Public Works (Canada) Victoria, B.C.; A. G. Fleming, Canada Cement Co., Montreal; W. J. Francis, Consulting Engineer, Montreal; J. A. Jamieson, Consulting Engineer, Montreal; A. G. Larsson, St. Mary's Portland Cement Co., St. Mary's, Ont.; P. B. Motley, Canadian Pacific Railway, Montreal; A. D. Swan, Consulting Engineer, Montreal; A. C. Tagge, Canada Cement Co., Montreal; E. Viens, Department of Public Works, Ottawa; R. B. Young, Hydro-Electric Power Commission of Ontario, Toronto.

R. J. Dnrley, as Secretary of the Canadian Engineering Standards Association, was actively in touch with the work of the Sub-Committee throughout and greatly facilitated the preparation and early issue of the specification.

ACCIDENT AT HYDRO POWER PLANT

Two Units of Ontario Power Co. Plant, Operated by Ontario Hydro-Electric Commission, Destroyed Last Week, Wrecking War-Time Extension to Power-House

UNITS 15 and 16 in the Ontario Power Co.'s plant at Niagara Falls, Ont., were destroyed last week, and Units 11, 12, 13 and 14 were flooded when the generator of Unit 15 burst and smashed the roof trusses, bringing down a large section of roof, which broke the turbine casing of Unit 16. The Johnson valve controlling these two units closed in time to prevent flooding of the whole power house, and the four flooded units are now being run to dry and will soon again be under load.

The Ontario Power Co. is owned and operated by the Hydro-Electric Power Commission of Ontario. Units 15 and 16 were added to the plant during the war under the direction of the engineering staff of the Commission. These units were not specially designed for the service in which they were placed but were purchased at second-hand from a power company in Tennessee. The units were originally designed for approximately 14,000 h.p., but have been delivering about 20,000 h.p. under the head at the Ontario Power Co. plant. This 40,000 h.p. extension to the Ontario Power Co. was undertaken by the Commission as a war measure to relieve the power shortage. The design and construction of this extension was described in "The Canadian Engineer," issue of January 16, 1919, by Thomas H. Hogg, assistant hydraulic engineer of the commission.

The turbines were of the double-runner, central discharge type, with spiral casings, and operated at 187½ r.p.m., under 180-ft. head. The extension of the power house was of concrete and structural steel construction, the roof trusses, crane girders and columns being of structural steel. The structural steel portion of the building was self-contained and independent of the concrete walls for stability. In connection with this extension, 1.3 miles of 13.5-diameter wood-stave pipe were built, and also one of the largest differential surge tanks ever constructed.

It is highly probable that Units 15 and 16 will not be

replaced, as the water required for their operation can be used under greater head—producing much more power—at Queenston; so it is likely that the extension to the Ontario Power Co.'s plant will be scrapped and removed in view of this accident, and work on the third unit at Queenston is being pushed in order to relieve the shortage of power caused by the accident.

Investigation into the cause of the accident is being conducted by the engineers of the commission's staff, but due to the very complete wreck of the unit that caused the trouble, it will probably be difficult to determine whether the accident was due to some defect in the generator or shaft, or to faulty operation.

INTERESTING DISPLAY OF WATERWORKS EQUIPMENT

AS WAS intimated in "The Canadian Engineer" for April 11, it is the intention of the committee in charge of the meeting of the Canadian section of the American Waterworks Association to be held in Brantford, Ont., May 12-13 to invite firms in Canada who are manufacturers of waterworks equipment to exhibit their machinery on that occasion. Arrangements have been completed whereby space for this purpose will be provided free of charge in a room convenient to the hall where the regular sessions of the convention are to be held. Not the least interesting feature of the convention of the American Water Works Association is the exhibition of waterworks equipment and supplies. Anyone who has attended these conventions cannot have failed to be impressed with the real interest which the delegates take in the exhibition of machinery and supplies that are always held in connection therewith. While there are not a great many manufacturers of waterworks equipment in Canada there are nevertheless sufficient to form the nucleus for the building up of a very fine exhibit as a regular feature of the annual meeting and it is to be hoped that those manufacturers who have been invited to exhibit on this coming occasion will do so. It will provide an excellent opportunity for placing before the men in Canada concerned with the design, construction and operation of waterworks plants, specimens of their products.

Already a number of manufacturers have signified their intention to exhibit, and those who have not yet sent in their requisition for space should do so as soon as possible so that the necessary provision may be made. There will be no charge for the space. Messrs. Norman D. Wilson, Chief engineer, Waterworks Commission, Brantford, Ont., and Mr. Jordan of the Dominion Steel Products, Brantford, are the gentlemen who have been appointed to look after this phase of the Convention. Consignments of materials for exhibition purposes should be addressed to the exhibitor, care of the Canadian section of the American Water Works Association, Chamber of Commerce, Kirby House, Brantford, Ont.. A most cordial invitation is extended to all Canadian manufacturers of waterworks equipment whether members of the Association or not to get in touch early with Messrs. Wilson or Jordan regarding the matter as those responsible for the meeting are exceedingly anxious that the exhibition should be really representative as far as the Canadian manufacturers are concerned. The present indications are that quite a number of responsible waterworks men of Canada will be present and machinery manufacturers and supply men should not miss this opportunity of getting into intimate touch with them.

The secretary of the Canadian section of the American Water Works Association is C. D. Brown, Walkerville Water Co., Walkerville, Ont., from whom further information can be secured.

Mechanical Working of Iron and Steel, was the title of a paper read by R. E. Buckley, assistant-superintendent of mills at the Dominion Iron & Steel Co., at a meeting of the Sydney, N.S., branch of the Engineering Institute of Canada

MURRAY REPORT ON HYDRO POWER

New York Consulting Engineer Presents Voluminous Document to National Electric Light Association, Comparing Ontario Hydro with Privately Owned Companies

WILLIAM S. MURRAY, consulting engineer, New York City, who conducted the super-power survey for the United States Government, and who was one of the experts who testified for the Hydro-Electric Power Commission in the hydro-radial inquiry, has presented a voluminous report to the National Electric Light Association of the United States, in which he compares the operations of the Ontario Hydro-Electric Power Commission and those of privately owned and regulated electric utilities in the United States and Canada.

Mr. Murray's report consists of 227 printed pages and cover, 8 by 11 in., the principal sections being: (1) Summary of Conclusions, 2 pp; Part One, 19 pp.; Part Two, 202 pp.; Index, 4 pp. Part One constitutes the report proper, while Part Two gives correspondence and facts ascertained in detail, to support the conclusions reached in Part One. In Part Two there are 5 plates, 36 figures and 24 tables, many of the plates and figures being printed in three or four colors.

The following introductory remarks by the National Electric Light Association appear on the cover:

"Widespread interest in the Hydro-Electric Power Commission of Ontario and a desire for authentic and reliable information regarding its working and accomplishments led the National Electric Light Association to have a report made thereon based on impartial and exhaustive study.

"Accordingly the Association enlisted the services of W. S. Murray, who conducted the Super Power Survey for the United States Government on the Atlantic seaboard between Boston and Washington, and who in addition is conversant with Canadian conditions, having acted for municipal and provincial bodies in a consulting capacity. In this work Mr. Murray was assisted by his partner, Henry Flood, Jr., formerly Secretary-Engineer of the United States Government's Super Power Survey organization.

"The report herewith made public by the National Electric Light Association covers the investigations made by Messrs. Murray and Flood from August 22, 1921, to February 10, 1922, and presents in a comprehensive and comparable way the advantages of electric service rendered by privately owned and publicly regulated utilities in the United States and Canada contrasted with that supplied by the most notable government-owned utility in the Western Hemisphere, i.e., the Hydro-Electric Power Commission of Ontario."

Mr. Murray's "Summary of Conclusions" follows.

"After a careful analysis of the governmentally-owned controlled and operated electric utility structure as represented in the Hydro-Electric Power Commission of Ontario, I am of the opinion, firstly, that the principles of its application can find no place in the United States; secondly, that to attempt the substitution of its principles of control and operation within the States would be to strike a blow at economic structures, the present existence of which are not only far better equipped to protect the public interests in their conjunctive relation with the public service commissions of the States regulating their rates, but it would also be to strike an equal blow at the shareholders of the electric utilities which are now serving the American public; and, thirdly, that the Hydro-Electric Power Commission owes its being only to the fact that a public service commission on the order of those operating in the States was not in existence in the Province of Ontario at the time of its creation.

"I support the above statement in the following conclusions:

"(1) Power as applied in Ontario from the governmentally-owned and controlled system in associate relationship with the Hydro-Electric Power Commission to be superior in kind to that supplied by the privately-owned electric utilities of the United States must be more adequate,

more reliable and cheaper. The facts show, however, that the electric utilities of the States hold more power in reserve and sell more energy per capita served, that by that token they can claim a greater reliability of supply and that the supply is cheaper to the consumer.

"(2) At the end of the fiscal year 1920, out of the total power plant capacity operated by the Hydro-Electric Power Commission only 23% of it was constructed by the Hydro-Electric Power Commission; the remainder represents plant capacity constructed at the initiative and risk of private investors, and in acquiring ownership of it, such intangibles as franchise rights, good-will and other intangibles were included in the purchase. This intangible cost, therefore, is represented in power "at cost." If a governmental plan of like characteristics to that of the Hydro-Electric Power Commission is to be inaugurated in the United States, it must include the purchase of or the contracting of power from existing utilities and the same problem of including intangibles will be presented here.

"(3) The building of new power plant facilities under the auspices of governmental ownership, as shown in the cases of Nipigon and Chippawa, both in respect to policy and cost, is not to the economic interest of the people.

"(4) The advocates of government or municipal ownership of electric utilities claim reduction in the cost of power by virtue of: (a) Elimination of taxes; (b) Elimination of Dividends; (c) Elimination of high-salaried executives; (d) More economical wage and higher efficiency in labor scale.

"With regard to (a)—taxes are not eliminated. Just as much money in taxes is paid. The difference is in their distribution. In the case of private ownership, only the users of service pay the tax bill, while in the case of government-owned utilities all the people pay the bill.

"With regard to (b), (c) and (d), notwithstanding dividends, high-salaried executives and the wage and labor claim, the answer is, when the total operations are summed up, the people receive the power at less cost through private ownership under regulation.

"(5) The investment of capital in electric utilities under private interest control is far better protected from extravagance than when that capital is governmentally-owned, for the reason that plans and estimates for such capital expenditures not only must gain the approval of a trained engineering and managerial staff and an experienced board of directors of the company, but it also must have the critical review of the banker and the private financial investor. In the case of governmentally-owned utilities, the directing heads are seldom specifically trained in the business under their jurisdiction.

"Arms, legs and body are useless without the head. A high-salaried executive usually saves many times (his salary included) the losses incurred by the cheaper and less efficient executive. Accomplishment by individuals in control of private enterprise is under keener observation than is the case when those in charge are governmental or municipal officers.

"(6) Governmental ownership eliminates all incentive for gain and throttles initiative. This is evidenced by the far greater growth of privately-owned utilities.

"(7) The Hydro-Electric Power Commission is the judge of its own acts. A commission cannot fairly be the judge of its own (and others') rights in contentions.

"(8) Honesty of purpose does not necessarily reduce the power bill. The structure under which it is administered counts just as much—so far as the price is concerned.

"(9) The American companies in the Niagara district are supplemented by steam power far more than those on the Canadian side, and yet on the American side power is being furnished at less cost to the people.

"(10) The Commissions of the States fully realize that protection to the people lies in protection to the electric utilities from which they are receiving power. The authority delegated to them to regulate rates, and the constitutionality of the law standing behind any action on their part or on the part of the electric utilities, provides a structure constructively balanced to do justice to all parties."

TO INVESTIGATE ONTARIO HYDRO

Premier Drury, of Ontario, Appoints Royal Commission with Wide Scope for Investigation—Includes R. A. Ross and M. J. Haney

PREMIER Ernest C. Drury, of Ontario, has announced the appointment of a Royal Commission to investigate the cause of the increased estimates for the Queenston-Chippawa power development, and the general operation of the Hydro-Electric Power Commission of Ontario. The commissioners are:

W. D. Gregory (chairman), of Trafalgar, Ont., barrister.

R. A. Ross, of Montreal, consulting engineer.

M. J. Haney, of Port Credit, Ont., contractor and civil engineer.

Lloyd Harris, of Brantford, Ont., capitalist.

James A. Ross of Toronto, manufacturer.

The commission is to enquire into and report upon the following:

(1) All estimates submitted from time to time to the Hydro-Electric Power Commission of Ontario for the Queenston-Chippawa power development, and also all estimates for the said work submitted by the said commission to the Government of Ontario.

(2) The reasons for increases from time to time in the estimates for the Queenston-Chippawa power development.

(3) The total cost, when completed, of the Queenston-Chippawa power development (a) with five units installed; (b) with units installed to the full capacity of the canal.

(4) The continuous output capacity of the Queenston-Chippawa power development under the conditions mentioned in clause 3.

(5) The methods of construction, supervision and management which have been employed in the Queenston-Chippawa power development, and whether they can justifiably be continued for the economical completion of the work.

(6) (a) The quantity of water now available for use by means of the Queenston-Chippawa canal; (b) the power that can be developed thereby in continuous output at the Queenston power station.

(7) In what manner and to what extent will the price of Niagara power be affected, if at all, by the cost of the Queenston-Chippawa development?

(8) Any other power development undertaken by the Hydro-Electric Power Commission, and generally all matters of expenditure and administration by the said commission.

The commissioners are also to make such suggestions and recommendations arising out of the subjects indicated as they may deem desirable, and to report the evidence and facts brought out by the investigation.

Robert Alexander Ross, of the firm of R. A. Ross & Co., consulting engineers, Montreal, was born in Woodstock, Ont., in 1865. He was apprenticed to an engine-builder as a machinist for five years, and later was works engineer for the Canadian General Electric Co. for four years. He was chief engineer of the Royal Electric Co., Montreal, for three years. He had been a consulting engineer for 27 years on different projects in various parts of the world. He is a Doctor of Science, University of Toronto, and took his degree of electrical engineer at the University of Toronto. Mr. Ross is a past president of the Engineering Institute of Canada, and is Chairman of the Research Council of Canada. He was for four years a member of the Administration Commission, Montreal.

Michael John Haney, who is a well-known contractor, is also the president of the Home Bank of Canada, vice-president Canada Steamship Lines, vice-president Quebec Steamship Co., director North American Life Assurance Co., president Pointe Anne Quarries, Port Credit Brick Co., Reynolds Co. and Canada Bond Co. He was born in Galway, Ireland, in 1854, and came to Canada in 1873, being educated in Watertown N.Y. He was connected in an engineering capacity in the building of several railways, and was manager of construction of the C.P.R., 1883-87. He

was superintendent of construction of the Crow's Nest Pass Line, C.P.R., and has built several breakwaters and other structures for the Dominion Government since 1904. He built the intake tunnel for the Toronto waterworks in 1909. He is a member of the Engineering Institute of Canada. He has acted as arbitrator in several disputes.

J. Allan Ross is vice-president, treasurer and managing director of Wm. Wrigley, Jun., Co., Ltd., manufacturers of chewing gum. He was born in Chicago, February 11, 1886, and was educated in that city, and is a Bachelor of Science of the University of Chicago. He began his business career as night manager, Bell Telephone Co., Chicago, in 1907. He was university tutor in Chicago from 1907 to 1909, in which latter year he became associated with the Wrigley Co. He started the Canadian business in 1910 as manager.

Lloyd Harris is president of the Russell Motor Car Co., Ltd.; Underfeed Stoker Co. of America; Canada Glue Co.; vice-president of the Willys-Overland, Ltd.; Canada Cycle and Motor Co., Ltd.; Machine and Stamping Co., Ltd., director of the Massey-Harris Co., Ltd.; Steel Co. of Canada, Ltd.; Dominion Power Transmission Co.; American Glue Co.; Trusts and Guarantee Co.; British Foundation Ovens, Ltd. He is a member of the Honorary Advisory Council for Scientific and Industrial Research. He was formerly Canadian Trade Commissioner to Britain, and was vice-president of the Canadian Manufacturers' Association in 1905. He was a member of the House of Commons, as a Liberal, from 1908 to 1911, but left the party over the question of reciprocity with the United States. He was born in Beamsville in 1867.

W. D. Gregory, barrister, is head of the legal firm of Gregory & Gooderham, Toronto. He has already served on two other commissions for the Drury Government, the Public Service Commission and the Commission to investigate the Police Court and police force in the city of Brantford. He was born at Montacute, Somerset, England, and came with his parents to Canada when eight years of age, settling in Oxford county. Mr. Gregory, when 12 years of age, left school and worked on the farm in the summer and in the woods in the winter until he was 19, when he returned to school, passed his entrance and entered high school. Working again on the farm, at the age of 22, he returned to high school and matriculated. He was called to the Bar in 1887.

CONFERENCE ON COMMERCIAL ENGINEERING

CALLED together by the United States Commissioner of Education, the Second Public Conference on Commercial Engineering will be held at the Carnegie Institute of Technology, Pittsburgh, Pa., on May 1st and 2nd. The proceedings are under the direction of the Committee on Commercial Engineering of the United States Bureau of Education and include many addresses by notable engineers, educators and business men. Representatives of the Canadian universities are being requested to attend and take part in the deliberations.

The speakers at the conference include among others, the following: W. F. Rittman, Professor of Commercial Engineering, Carnegie Institute of Technology; Dexter S. Kimball, Dean of Engineering, Cornell University; P. F. Walker, Dean of Engineering, University of Kansas; R. L. Sackett, Dean of Engineering, Pennsylvania State College; D. C. Jackson, Professor of Electrical Engineering, Massachusetts Institute of Technology; H. R. Hatfield, Dean of the Faculties, University of California; F. B. Jewett, Vice-President, Western Electric Co., New York City; W. E. Mott, Director, College of Engineering, Carnegie Institute of Technology; C. R. Dooley, Director, Personnel and Training, Standard Oil Co., New York City; C. R. Mann, Chairman of Operations and Training Division, General Staff, War Department, Washington; Arthur E. Morgan, Antioch College.

The object of the convention is to investigate business training for engineers and engineering training for students in business. It is believed that not all has been done that might profitably be done in the matter of co-ordinating instruction in business and engineering in educational institutions.

OPPORTUNITIES IN 1922

BABSON, the well-known economist of Wellesley Hills, Mass., says: "Every year has its opportunities. Great fortunes are made during periods of depression as well as during periods of prosperity. They, however, are made by different groups of people and in different ways. 1922 will offer wonderful opportunities, but they must be sought for. They will be found by the engineer rather than by the promoter, by the thrifty banker rather than by the speculator, and by the man who creates and upbuilds rather than by the middle-man or trader."

CANADIAN ENGINEERING STANDARDS ASSOCIATION JUSTIFYING ITSELF

WITH the publication of the standard specification for Portland cement mentioned elsewhere in this issue, the Canadian Engineering Standards Association has prepared and made available for the public five different standard specifications. These deal with steel railway bridges, distribution type transformers, galvanized telegraph and telephone wire, wire rope for mining and dredging purposes, and Portland cement. In view of the difficulties involved in creating for such work an organization of technical men working without remuneration, and in overcoming the inertia, and even opposition from certain quarters, the Association has achieved much in its existence of three years.

It has been tacitly assumed by some that the influence of American specifications on this continent would make it impracticable to devise anything different or original applying to construction in Canada. The Portland cement

specification is a clear answer to such an assumption. This document not only makes provision for the particular national conditions existing in this country, but at the same time in a number of ways constitutes a real improvement over the standard American specification, that prepared by the American Society for Testing Materials. There are sufficient experts in the manufacture, testing and use of cement in Canada to give our own views weight and authority. If in any particular we are able to devise specifications that are improvements on the American ones, we should by all means do so regardless of the fact that a certain advantage might accrue from international uniformity.

CONSERVATION OF ELECTRIC ENERGY

UTILIZATION of electric current which otherwise might be wasted is possible in many industries through the generation therewith of steam to be used either in cooking, drying, humidifying or heating of buildings. As was pointed out by F. T. Kaelin in a recent address given at a joint meeting of the Montreal Branch of the Engineering Institute of Canada, and the Montreal section of the Society for Chemical Industry and the Canadian Institute of Mining and Metallurgy, over three hundred installations of electric steam generators are known to exist in Italy, Switzerland, Sweden and France. Although the high price of fuel along with the low price of electrical energy particularly favors such installations in these countries, nevertheless a number of them have already been operated with success in Canada and the United States.

In any ordinary competition of electric energy with coal at reasonable prices, the electric generation of steam is entirely out of the running economically, by reason of the simple fact that the development of one heat unit by the use of electrical current costs a great deal more than the development of a heat unit by the burning of coal, even allowing for the large losses that occur in the latter operation. There are, however, many cases where electric power is paid for at a flat rate based upon consumption at peak load and where the current at off-peak would ordinarily be wasted. If, at the same time, fuel costs chance to be high the electric generation of steam may be practicable. The low capital expenditure incurred in the provision of electric generators, and the small operating charges involved in their operation, favor such procedure.

An interesting case of conservation brought about in this manner was in the case of a pulp and paper mill cited by Mr. Kaelin in which the saving of coal for heating effected on the fifty-two Sundays and three holidays during the year when electrical energy was not being utilized otherwise was more than sufficient to pay for the entire cost of installing the generator in less than one year. It is possible, too, that under temporary conditions of small power demand the power companies might find it advantageous to dispose of excess power at low rates for steam generation. This procedure would, of course, become impracticable as soon as power demands became normal.

The fact that the utilization of unused electric energy has been found commercially practicable in a number of cases in this country ought to encourage engineers in devising means of further conserving our electrical energy.

PERSONALS

D. F. DOWSLEY has been appointed road superintendent for the Township of Front of Escoff.

R. E. McDONNELL, architect, of Montreal, will form a partnership with F. W. WARREN, architect, of Hamilton.

JAMES F. McLAREN has been appointed assistant superintendent of the Island filtration plant, Toronto, Ont., to succeed the late Wm. Scott.

EUGENE LAPOINTE, consulting engineer of Baie St. Paul, Charlevoix County, Que., has been admitted to membership of the Corporation des Arpentiers-Geometres of the Province of Quebec.

GORDON L. SHANKS has just been appointed Municipal Engineer for Rockwood Municipality, near Winnipeg, Man. During the past year Mr. Shanks has been engaged on construction work in Mexico in connection with the Foundation Co.

WILLIAM P. HINTON, formerly vice-president of the Grand Trunk Pacific Railway, who was superannuated after thirty-five years' service on March 1 last, has been appointed vice-president and general manager of the Cadoman Coal Properties in the Rocky Mountain district, south of Edson.

C. H. WITHERS, who has been actively associated with Escher Wyss & Co. interests in Canada for the last nine years, and latterly attached to the staff of the General Supply Co. of Canada, Ltd., will sail next month for England, where he will be a member of the London staff of Escher Wyss & Co.

J. F. PARSONS and GILBERT T. ED, both of Moncton, N.B., have formed a construction company which will be known as the Parsons-Ed Co. Mr. Parsons has been following construction work for over 16 years, while Mr. Ed has been carrying on business as a general contractor in Moncton for several years.

FREDERICK T. KAELEN, chief engineer of the Shawinigan Water & Power Co., Montreal, who, jointly with Julian C. Smith, was in charge of the design of the inter-

esting extension to that company's hydro-electric plant at Shawinigan Falls, Que., described in "The Canadian Engineer" for March 14, 1922, was born on July 30, 1874, in Switzerland, and was educated at the Federal Technical University, Zurich. Mr. Kaelin came to Canada in 1902 and entered the employ of the Shawinigan Water & Power Co. as a draughtsman. From 1905-7 he was designing engineer on the staff of Wallace C. Johnson, consulting engineer, Niagara Falls. He then returned to the Shawinigan Water & Power Co. as assistant chief engineer, becoming chief engineer in June, 1919. Mr. Kaelin is a member of the Engineering Institute of Canada, the American Institute of Electrical Engineers and the American Society for Testing Materials.

OBITUARY

CAPTAIN LEWIS W. KLINGNER, of Toronto, was accidentally drowned in the river Tigris near Bagdad on April 2. Captain Klingner was a civil engineer connected with the Irak Irrigation Co., as officer in charge of surveys for Mesopotamia, with headquarters at Amara. The deceased was born in 1886 and educated at Harbord Collegiate Institute and Toronto University, graduating in 1907 from the School of Practical Science. He was connected with the Canadian Pacific Railway in an engineering capacity for a number of years and also with the Dominion Construction Co. In September, 1914, he enlisted with the Canadian Engineers and served in France with the 4th Division. Capt. Klingner was a member of the American Society of Civil Engineers and an associate member of the Engineering Institute of Canada.

Engineer's Library

CANADA CEMENT CO. ISSUES ATTRACTIVE NEW HOUSE ORGAN

NUMEROUS interesting articles, well illustrated, are contained in No. 1, Vol. 1, of "Municipal Improvements," a new house organ published by the Canada Cement Co., Ltd., Montreal. No definite announcement is made regarding the frequency with which "Municipal Improvements" will be issued, but it will probably be quarterly. The first issue, which is dated March, 1922, contains 24 pages and cover, 8 1/2 by 11 in., well printed on coated paper, with an attractive cover in colors, showing a view of the canal section of the Chippawa power development. The articles describe numerous interesting examples of concrete work in various parts of Canada, including the Chippawa development, St. Margaret's Bay power development, Peterborough bridge, Maryland St. bridge, St. John pipe-line, Point Grey school, etc. It also includes other interesting information, such as yardage of concrete pavements in the United States and the tentative construction program for the coming season for the Ontario Department of Highways.

FIRE PREVENTION AND FIRE PROTECTION AS APPLIED TO BUILDING CONSTRUCTION: A HANDBOOK OF THEORY AND PRACTICE—By Joseph Kendall Freitag, author of "Architectural Engineering," "The Fireproofing of Steel Buildings," etc. Second Edition. New York: John Wiley & Sons, Inc.; Flexible imitation leather; 4 by 6 1/2 in.; pp. 1037; illustrated; \$5.00.

Important changes and extensions have been made in this, the second edition of Mr. Freitag's handbook "Fire Prevention and Fire Protection." With the art developing at a rapid rate, it is manifestly necessary to revise the literature of the subject at frequent intervals, and the author has shown evidence of the desire to keep this work strictly up to date.

The principal revisions relate to design, construction and equipment, although extensive changes have been made in the chapters dealing with theatres and garages by reason of the fact that practice with respect to these classes of buildings has advanced very considerably since the first edition of the work was published.

Annual fire losses for the United States have not been tabulated subsequent to the year 1909, since their relative magnitude was very much obscured by the enormous national expenditure during the war period. It was thought that the normal relation of fire losses to the national budget would be better displayed by pre-war comparisons. The stupendous fire loss sustained is, however, clearly indicated in the fact that for the five-year period from 1915 to 1919 the annual loss in the United States was very nearly three hundred million dollars.

In the present edition references to comparative costs have in the main been omitted by reason of the fact that they fluctuate from year to year.

This work in its revised form furnishes a very convenient manual for those having to do with fire prevention and fire protection. Not only is the question of fire losses and their prevention discussed from a broad and basic standpoint, but a very large amount of practical data are given on fire tests of materials and their permanency. The design of the main structural elements of buildings, as well as of many details affecting fire resistance, is carefully discussed. Consideration of the fire aspect of various structures as a class, such as theatres, schools, factories, etc., form an important part of the work. Of value, too, is the discussion of auxiliary equipment and safeguards for the prevention and fighting of fire.

For architects and engineers concerned with the design and equipment of buildings this work is indispensable.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand or proposed, contracts awarded, changes in staffs, etc.

TENDERS PENDING

The following tabulation is presented as a reminder to contractors in regard to tenders that are still pending, other than those reported in this issue. The word "Issue" refers to the issue of "Canadian Engineer" in which there appeared a notice giving details regarding the call for tenders.

Place of Work	Tenders Close	Issue
Prince Edward Island, Province of, grading and concrete structures	Apr. 28	Apr. 11
Prince Edward Island, Province of, road materials	Apr. 28	Apr. 11
Halifax, N.S., construction of three roads	Apr. 29	Apr. 18
Queenston Heights, Ont., sub-grading and construction of macadam road-way	May 24	Apr. 18
St. Thomas, Ont., construction of pavements	Apr. 28	Apr. 18
Welland, Ont., construction of water-bound macadam and bituminous penetration roads	May 1	Apr. 28
Petrolia, Ont., supply and construction of steel reservoir foundation and pump	May 1	Apr. 18
Calgary, Alta., supply of an electric arc welding outfit	Apr. 27	Apr. 18
Pridgewater, N.S., erection of Fire Hall	May 8	Apr. 18
Pembroke, Ont., erection of hospital	May 9	Apr. 11
Ontario, Province of, various work on Provincial highways	May 11	Apr. 11
Fort William, Ont., construction of school	Apr. 27	Apr. 18
Toronto, Ont., work on Riverdale Branch Technical School	May 3	Apr. 18
Vauxhall, Alta., erection of school building	May 1	Apr. 18
Adamsville, Que., construction of concrete bridge	May 1	Apr. 18
Crystal Beach, Ont., sewer and disposal plant	May 5	Apr. 18
Phillipsburg, Que., gravelling of road.....	May 1	Apr. 18
St. Andrews, Man., maintenance of roads	May 1	Apr. 18
Toronto, Ont., construction of Gerrard St. bridge	May 16	Apr. 18
Guelph, Ont., manufacture and delivery of sewer pipe	Apr. 27	Apr. 18
Guelph, Ont., supply of Portland cement	Apr. 27	Apr. 18

BRIDGES, ROADS AND STREETS

Brantford, Ont.—Tenders will be received by Alan Blair Jackson, Brant County Engineer, Court House, until 5 p.m., Tuesday, April 25, for the supply of an estimated amount of 6,000 barrels of cement in carload lots for the season 1922.

Cameron R.M., Man.—Tenders addressed to T. B. Woodhull, Sec.-Treas., Hartney, Man., will be received until 12 o'clock noon, April 29, for the grading of nine miles of road. Also for the manufacture of concrete pipe culverts required on 38 miles of road. Specifications may be obtained at the office of the Highway Commissioner, Parliament Buildings, Winnipeg, or at the office of the Secretary-Treasurer, Hartney, Man.

Escott, Ont.—Council of Front of Escott Township passed a by-law to provide \$3,000 for construction and \$7,

500 for maintenance of township roads. Clerk, Ernest C. Kelly, Mallorytown, Ont.

Francis, Sask.—Tenders addressed to S. Mars, Sec.-Treas., will be received until 6 p.m., May 5, for all or parts of the following work: Sixty miles of blade grader work, 25,000 cu. yds. grading and 1,200 lin. ft. of pipe (placing and hauling). Plans and specifications may be seen at the office of the Municipal Engineers, Parsons Engineering Co., Regina.

Halifax, N.S.—City Council awarded contract for construction of pavement to Victor Osterburg.

Halifax, N.S.—Representatives of city and Highways Commission will hold a conference regarding the proposed improvement of the Dutch Village Road.

Halifax, N.S.—Provincial Highway Board received tenders from following for construction of Bedford-Waverley road: McDonald Construction Co., Ltd., Engineers & Contractors, Ltd., J. M. McGrath, W. J. Stuart, Naugle, Hiltz & Conrad, Terminals Construction Co., McNab Construction Co., Ltd., Fraser Paving Co. and Provincial Highways Board. It was decided by the Board to carry on the work by day labor under the Board's officials.

Halifax, N.S.—Provincial Highway Board received tenders from following for construction of Irish Cove-Big Pond road: Chisholm & MacMillan, Nova Scotia Road Builders, Engineers & Contractors, Ltd., William Cooke, E. A. Cranston, Provincial Highways Board, John L. Sexton and Charles McKenzie, Nova Scotia Construction Co., Ltd., Graham & MacKay and Israel, McKenzie Bros. & Cunningham. Board decided to carry this work on by day labor under Board's officials.

Halifax, N.S.—Tenders were received from the following by the Provincial Highway Board for the construction of the Kenzieville-Pictou Antigonish County Line road: W. J. Stuart, Chas. McNeil, John Fraser, A. J. Bannerman, Fulton Bros., Chas. Sproull, C. D. Chisholm, Terminals Construction Co., Provincial Highways Board, Williams Bros. E. P. Power and P. Meikle submitted a combined tender, as did also the following firms: Chas. A. Mitchell, A. R. McDonald, T. J. Sears and T. J. Bonner. Contract was awarded to W. J. Stuart, Yarmouth North, whose tender was the lowest received.

Hamilton, Ont.—City Council adopted recommendation for the construction of a sidewalk on the south side of Concession St., from Wentworth St. to Albert St. City Engineer, E. R. Gray.

Hamilton, Ont.—City Council approved the paving of Wentworth St., from King St. to the T. H. & B., and Cumberland Ave., from Gage to Sherman Ave. Petitions were received for the paving of St. Clair Ave. and Eastbourne Ave., from Cumberland Ave. to the T. H. & B. railway.

Hamilton, Ont.—Wentworth County Council made the following appropriations for road work this year: Ninth Concession, \$1,500; Jerseyville, \$4,000; Brock, \$5,000; Sydenham, \$1,000; Dundas, \$19,900; Port Plamboro, \$7,000; Blinbrook, \$25,000; Governors, \$8,000; Mohawk, \$2,000; Green, \$2,400; Kirkwall, \$700; Copetown, \$3,000; Glanford and Blinbrook, \$3,000; Barton St., \$4,200; Tapleytown, \$7,700. Supt., T. R. Allison, Hamilton.

Kitchener, Ont.—Tenders will be called for the construction of asphalt pavements on the following streets: King, from Albert to Hmlts; Frederick, from King to House of Refuge; Wilnot, from King to Strange; Queen, from Ellen to Lancaster; Linden, from Joseph to Michael; Gaukel, from King to Joseph, Victoria from Ahrens to Lancaster; and Weber, from Brethaupt to G.T.R. tracks. City Engineer, S. Shupe.

Leamington, Ont.—Contract for construction of 2½ miles reinforced concrete pavement with curbing and catch basins have been awarded to the Chick Contracting Co., Ltd., Windsor, for approximately \$85,000. Tenders were also received from the following firms: Archibald Construction Co., Ltd., Toronto; Pettipiece's, Ltd., Amherstburg; Cadwell Sand & Gravel Co., Windsor; S. P. West, Sandwich; B. Oldoni, Windsor; McNamara Bros. & Thornton, Sault Ste. Marie; Johnson Bros. Co., Ltd., Brantford; L. J. Looby, Dublin, Ont.; F. Smithson, Leamington; Campbell & Latimore, Toronto; Hamilton Contracting Co., Hamilton; Oakwood Construction Co., Windsor; Merlo, Merlo & Ray, Ltd., Walkerville.

London, Ont.—Bridge Committee of Middlesex County Council awarded following contracts: Culvert at Strathroy, Isaac Drake, at \$1,122; rebuilding Muncey bridge, steel work, W. J. Reader, Alvinston, \$2,049; concrete work, E. Kelly, Lambeth, \$2,090. Caradoc and Ekfrid bridge, concrete work, C. Ferguson, Melrose, \$860; steel work, W. J. Reader, Alvinston, \$399. Caradoc, two bridges, I. Drake, Strathroy, \$1,593. Bridge in East Williams, I. Barons, Nairn, \$915.

Maple Ridge, B.C.—Municipal Council has made arrangements to open up and extend the Jackson Road East to Spillbury Road, and construct bridges, one across a ravine 1,200 ft. long. Clerk, J. C. McFarlane.

Nanaimo, B.C.—The South Forks bridge is to be rebuilt at a cost of about \$7,000, the Provincial Government to pay half the cost. Minister of Public Works, Hon. W. H. Sutherland.

Niagara Falls, Ont.—New tenders on asphalt paving plant of 1,250 sq. yds. capacity were opened on the 18th inst. and contract awarded to Barber Asphalt Co. "Iroquois Plant." Following bids were received on a 1,250 steam melting, oil burning, semi-portable plant without power or boiler: Barber Asphalt Co., \$14,572; Hetherington & Berner, \$15,090; F. D. Cummer & Son Co., \$15,775; Warren Bros., \$12,950; Dominion Industrial Products Co., Ltd., \$13,014.78. All tenders in Canadian funds for plant erected and in running order; duty paid.

Oakville, Ont.—At the next meeting of the Town Council a by-law to provide for a program of road construction will be brought up. Petitions for concrete walks on four streets will also be received. Clerk, Percy A. Bath.

Ottawa, Ont.—At the next meeting of the Town Planning Commission the widening of Besserer St., between Sussex and Mosgrove Streets, was discussed; also the widening of Mosgrove St. to 80 ft.

Owen Sound, Ont.—City Council decided to construct a concrete road on 2nd Ave. E., from 12th St. to 14th St. Clerk, Chas. Gordon.

Palmerston, Ont.—Wellington County Council plans paving of several streets here. Road Supt., John M. Young, Harriston.

Quebec, Province of.—An inspection of the projected Quebec-St. Ann Highway will be made shortly by engineers of the Department of Roads, after which tenders will be asked by Hon. J. L. Perron, Minister of Roads.

Quebec, Province of.—Contract for the Montreal-Mont-Laurier highway was awarded by Provincial Department of Highways to Frank Walter & Co., for \$181,000. The highest tender received totalled \$373,000. The construction work on this contract is divided into two sections, four miles from Janvier to Ste. Therese and 21 miles north of St. Jerome.

Quebec, Province of.—New tenders are being called by the Hon. J. L. Perron, Minister of Roads, for the construction of sections of the Montreal-Sherbrooke and St. Lambert-Levis highways. Those already received were considered too high and were rejected. The section of the Montreal-Sherbrooke highway to be constructed is about 27 miles long. The St. Lambert-Levis highway is about 23 miles long and runs from St. Lambert to Sorel.

Revelstoke, B.C.—Provincial Public Works Department will start work on May 1 on construction of uncompleted two miles of the Revelstoke-Taft link of the Revelstoke-Vernon highway.

St. Catharines, Ont.—Lincoln County Council awarded contracts to the Law Construction Co., Toronto, and Roy Haesberger, Vineland, Ont., for the supply of material and construction of bituminous penetration and macadam roads, and to McIntosh & McDougall, Cornwall, for material and construction of macadam road.

St. John, N.B.—Common Council decided to call tenders for 1,875 lin. ft. of straight curbing and 144 ft. of circular curbing for Waterloo St. Estimated cost, \$5,300.95.

St. Joseph de Chambly, Que.—Tenders were received at the office of L. J. E. Brais, Sec.-Treas., County of Chambly, 130 Chambly Road, Longueuil, Que., until April 22, for the construction of a bridge on Chambly Road, Parish of St. Joseph de Chambly.

Shuniah, Ont.—By-law will be submitted to ratepayers on May 13 to authorize the borrowing of \$10,000 for the construction of roads in the Township of McIntyre. Clerk, H. A. McKibbin.

Toronto, Ont.—City Council referred back the matter of a lane south from College St., between Roxton road and Ossington Ave., for two weeks.

Toronto, Ont.—City Council intends to construct curbing on Hiawatha Road at a cost of \$498, and asphaltic concrete pavement at a cost of \$9,838.

Victoria, B.C.—Provincial Department of Public Works will shortly call for tenders on four or five classes of work in connection with the paving of about three miles of the Pacific Highway, including concrete, Tarvia, macadam and bitulithic. Minister, Hon. W. H. Sutherland.

York Tp., Ont.—Call for tenders for construction of six reinforced concrete culverts has been recalled.

WATER, SEWAGE AND REFUSE

Barton Tp., Ont.—A scheme to install water and sewer connections in the township at a cost of about \$239,000 was outlined by the Mountain Improvement Society at a recent meeting of Barton Township Council.

Bridgeburg, Ont.—Bridgeburg and Fort Erie Councils considering construction of joint sewer in Amigari section at cost of \$40,000.

Chatham, Ont.—Tenders will be received for the supply and construction of steel sheet piling baffling system in water works sedimentation basin up to 5 p.m. Wednesday, May 10. Plans and specifications may be obtained at the office of the City Engineer. Address tenders to the Secretary Board of Works Commissioners, Chatham, Ont., endorsed "Tender for Sheet Piling." C. H. R. Fuller, City Engineer. (See official advertisement).

Hamilton, Ont.—Contract for construction of Section No. 3, Western storm overflow sewer, awarded to J. H. McKnight Construction Co., Ltd., Toronto, at \$192,700.

Midland, Ont.—Construction of approximately three miles of sewers, for which tenders were called, is being carried out by day labor.

Oshawa, Ont.—Board of Works recommended to Town Council that contract for completion of Base Line sewer to the Central Foundation Co. of Toronto, for approximately \$17,000, material for work to be supplied by town.

Ottawa, Ont.—Contract for supply of vitrified clay sewer pipe was awarded to Barrett Bros., of Ottawa, for a term of three months dating from signing of contract, the total amount of their contract being \$18,030. Four tenders were received, two for concrete pipe and two for vitrified clay pipe. The other tenders received were: T. S. Kirby Co., Ltd., Ottawa, vitrified clay pipe, \$18,108; Independent Concrete Pipe Co., Ltd., Toronto, concrete sewer pipe, \$18,768.70; Dominion Concrete Co., Kemptville, concrete sewer pipe, \$8,590. The latter firm did not quote on all the items in the tender form. Both Barrett Bros. and the T. S. Kirby Co., Ltd., bid on Standard Clay Products, Ltd., pipe.

Toronto, Ont.—City Council intends to construct a water main on Cranbrook Ave., at a cost of \$3,063.

Toronto, Ont.—Board of Control decided not to grant the application of the Township of York for an increase in the supply of water received from the city's system.

Toronto, Ont.—A recommendation was made to Board of Control by Street Commissioner Wilson that a piece of land, south of the railway tracks, just west of Dufferin St., be purchased as a site for an incinerator plant.

LIGHT, HEAT AND POWER

Brockville, Ont.—Work has commenced by the Hydro-Electric Power Commission of Ontario on the construction of a new line on the St. Lawrence system between Morrisburg and Brockville.

Niagara Falls, Ont.—City Hydro Commission let contract for new sub-station to the Robertson Construction Co., of this city, at \$67,190.

Paisley, Ont.—A Hydro power line will likely be constructed from Chesley to supply Paisley.

RAILWAYS

Fort William, Ont.—Tenders for Street Railway track construction, addressed to the Chairman of the Public Utilities Committee, will be received by the City Clerk, until 5 p.m., Monday, May 1. Specifications at office of A. L. Farquharson, Manager of Street Railway.

Toronto, Ont.—Board of Control held a special conference with the local Hydro-Commission and the Transportation Commission to discuss the installation of a new connection with the Hydro system for supply of power for the Street Railway after September 1, when the agreement with the Toronto and Niagara Power Co. expires. This action has been taken so that the Street Railway will not be left without power in case the "clean-up" deal is not consummated.

FACTORIES AND LARGE BUILDINGS

Almonte, Ont.—Contract for erection of convent awarded to A. C. Gilmour, for \$14,140.

Barton Tp., Ont.—An early move is anticipated on the part of Barton township trustees to again revive the plan of building a new school on Concession St., mountain top, upon the site owned by the Board of Education.

Barton Tp., Ont.—A meeting of Barton Township School Section 3 ratepayers was held for the purpose of authorizing the issue of debentures for additional school accommodation. The resolution at the last annual meeting calls for the building of an 8-room addition to Lloyd George school, a 2-room addition to Brantdale school and a separate 4-room unit at Wellington St.

Berton, Man.—Contract for school awarded to John Mowat, of Gladstone, Man., at \$4,100.

Birch Cliff, Ont.—Contract for excavation of the new High School was awarded to Torrance Weir, of Agincourt, at 60 cents a yd. Contract calls for the removal of 3,000 cu. yds.

Bolton, Ont.—Plans for the erection of a new Town Hall at a cost of \$5,000 were approved by Town Council. Clerk, F. E. Snider.

Bridgeburg, Ont.—School Board let contract for construction of a four-room addition to the Wintermute Street school, to Somerville & Dilworth, of Welland, at \$2,212. The entire cost will be about \$30,000.

Bury, Que.—Catholic Board of School Commissioners considering erection of school.

Clarkson, Ont.—It is announced that the erection of a plant on the Dundas highway is under consideration by a rubber company. Address E. A. Orr, Reeve of Toronto Township.

Catharines, Ont.—Ratepayers passed by-law authorizing council to provide \$30,000 for erection of High School.

Delhi, Ont.—By-law, providing for the issuing of debentures amounting to about \$15,000, to cover the cost of constructing the proposed continuation school wing to the present public school, will be submitted to the ratepayers on April 26.

Edmondville, Ont.—Tenders will be received, addressed to W. J. Finnigan, Secretary, until Saturday, April 29, for the building of a new brick schoolhouse.

Fort William, Ont.—Tenders will be received at the office of A. McNaughton, city clerk, until 5 p.m., Tuesday, May 2, for placing a tar and gravel roof on the south half of the Central Fire Hall, Brodie St.

Kingston, Ont.—A building will be erected at a cost of \$300,000 to be used as a vocational training school.

Kingston, Ont.—Plans have been prepared for the new Eastern Ontario Dairy School. Address Prof. L. A. Zufelt.

Lambton, Ont.—Tenders addressed to J. H. Dicken, Secretary, Board of Education, S. S. No. 33, York, 43 Eileen Ave., Station D, West Toronto, will be received until 12 o'clock noon, Monday, May 1, for the erection of a four-room addition to the Lambton Park School. Plans and specifications may be obtained at the office of Smith & Wright, architects, Dominion Bank Chambers, 2945 Dundas St. West, Toronto.

Levis, Que.—Fire damaged the factory building of Cote & Jean, Commercial St., to the extent of \$15,000.

London, Ont.—The Tecumseh Amateur Athletic Association is behind a scheme to construct an artificial ice plant at a cost of \$80,000.

Metiskow, Alta.—Work will shortly start on the erection of a school. Also on the erection of new municipal offices.

Mimico, Ont.—Following contracts awarded in connection with erection of 6-roomed school: General contract, Wickett Bros., Toronto, \$45,449; electrical, Warner & Fordey, Mimico, \$1,070; plumbing and heating, James Millen & Co., \$10,174.

Montreal, Que.—Notre Dame Convent was destroyed by fire. Loss, \$150,000.

Montreal, Que.—Work has started on the construction of a four-storey addition to the office building of the Great West Life Assurance Co.

Montreal, Que.—Construction of three schools is being considered by the Protestant Board of School Commissioners. An extension to the Royal Arthur School is also on the program of the Board for this season.

Montreal, Que.—Sketches for the construction of the City Hall will shortly be completed. They will show first the use of the old building, and secondly, the construction of a new building on the old site. The amount available for the work is \$1,500,000.

Montreal, Que.—Tenders for the erection of the Notre Dame Hospital on Sherbrooke St. East, will be received at the office of Stevens, Lee & A. H. Lapierre, Associated Architects, 30 St. James St., until noon, May 15, for the concrete, steel work, masonry, brick work, roofing, sashes, etc., required to carry up and enclose the buildings.

Montreal, Que.—Following contracts were awarded for 12-room extension to Royal Arthur School on Canning St., by Protestant Board of School Commissioners: General contract, Nicholson Construction Co., Ltd., \$112,179; plumbing heating and ventilating systems, D. A. Bethune, Ltd., \$30,300; electrical work, Vincent & Say Electric Co., \$3,750.

Murrayville, B.C.—At a recent meeting of the Langley Council a large deputation presented a petition asking that a school be built at the corner of Hunter and Robb roads.

Nepean Tp., Ont.—New school will likely be erected. Clerk, John Gamble, Westboro.

New Toronto, Ont.—By-law providing for the purchase of a school site will be submitted to ratepayers.

Oakville, Ont.—Plans for the new \$25,000 Sunday School, proposed for the Oakville Methodist Church, have been approved by Board of Trustees. Campaign for funds will start beginning of next month.

Orangeville, Ont.—Orangeville Arena Co., Ltd., plan erection of skating rink, work to start immediately.

Ottawa, Ont.—Westboro-Nepean High School Board plan erection of High School. Tenders will be called shortly.

Ottawa, Ont.—Bulk or separate tenders will be received by the Public School Board until 12 o'clock noon, Thursday, April 27, for the several works required for the erection of additions to Cambridge St. and Glashan Schools.

The Canadian Engineer

A Weekly Paper for Civil Engineers and Contractors

Water Works System at Richmond Hill, Ont.

Eight Million Gallon Capacity Reservoir—Old Earth Dam Rebuilt With Concrete Core Wall — Filters and Pumps in One Building With Coagulation Basin Adjoining and Clear Water Reservoir Under Pump House

By G. H. BAKER

Resident Engineer for James, Proctor & Redfern, Ltd.

CONSTRUCTION of the waterworks system for the village of Richmond Hill, Ont., was started in the fall of 1921. The supply of water is conserved by reclaiming and building up an abandoned earthen dam, and so holding back a stream of considerable flow, to create a storage

with a topography possessing natural advantages for creating a reservoir, and across the mouth of which has been rebuilt the historic dam. This old retaining wall is 400 ft. long, about 12 ft. high at the highest point, and has a roadway across the top averaging 30 ft. wide.

Construction of Dam

Tenders having been called for the work, a contract was let to Reid & Somers, of Guelph, Ont., to reconstruct the dam and build the filtration plant. To put the old wall into a serviceable condition, it was first necessary to make it water tight. To do this, a concrete core wall of 1:4 mix with gravel, was poured, stretching completely across the site and directly in front of the original dam, over which an earth fill with a slope of 2:1 was made to form the face of the wall. The trench for the core wall

GENERAL VIEW OF SITE, SHOWING PUMP HOUSE, EARTH DAM AND CULVERT

basin of large proportions. Dating back to the days when the district was an active and prosperous lumbering centre, this stream, which winds its way through the outskirts of the village about a mile west of Yonge Street, was dammed by the pioneers with an earthen wall, in order that they might secure power for manufacturing their forest products. But the forests were cut down and the lumbermen were forced to move northward to obtain a new supply of timber, leaving this example of pioneer engineering work to gradually fall into ruins. Many years afterwards, around this same spot, a modern waterworks system was built by repairing the old earthen dam, building a sluiceway or overflow outlet, constructing a pump house and filtration plant and erecting an elevated tank. From this supply system about four miles of distribution mains were laid throughout the village, delivering the supply of water for drinking and for fire protection.

The stream had its origin in springs about three miles to the north and with its minimum flow of 330,000 gallons per day, delivers a very generous supply for a village of this size. It flows down through a small valley or basin,

VIEW SHOWING CORE WALL BEFORE EARTH FILL WAS MADE

was about 8 ft. wide and was dug out of the soft marsh soil by a Keystone excavator. Excavation was carried down to a strata of gravel which was struck about 5 ft. below pond level, and which gave an excellent footing to the wall. The whole bottom of the trench was covered

with a layer of concrete 12 in. thick, on which the wall proper rests. The wall is 10 ft. high, measures 12 in. across the top and 3 ft. at the bottom, both sides being battered. As its purpose is to prevent seepage and not to take stress, no reinforcing is necessary. To pour the

mits the drainage of the reservoir when necessary.

Situated on the low land back of the retaining wall, is the filtration plant and pump house, a compact and substantial building, measuring 59 ft. by 40 ft. over all, of reinforced concrete and brick construction, with steel sash and 4-ply tar and gravel roof. The working parts of the plant are located at an elevation below that of pond level, so that the water flows from the 10-in. intake pipe, running out into the pond to the mixing chamber and coagulation basin, through the filters to the clear water well below, by gravity. Below natural ground elevation we have the clear water reservoir, then at ground level are the mixing chamber, coagulation basin, filters, piping for filters, heating plant and pumps, while the upper floor, which is at the same elevation as the roadway over the dam, comprises the office, operating gallery for the filters and alum storage room. The building is efficiently heated by a Pease pipeless hot air furnace.

Coagulation Basin

The coagulation basin takes up the front section of the building and is built with 12-in. thick floor walls and an 8-in. roof, all heavily reinforced. The roof is 18 in. below the roadway over the dam, and is covered over with an earth fill, in order that the temperature of the water might not be greatly effected by the atmospheric temperature. The fill runs out to the dam proper, and so makes this roof as part of the roadway. The sedimentation basin measures 26 ft. by 40 ft. and is divided into four longitudinal sections by partitions 3 in. thick, of concrete plastered on metal "Hyrib," set in a groove left in the floor and ceiling for same. This creates a passage way 140 ft. long, 6 ft. wide and 12 ft. high, through which the water flows during the sedimentation period.

The mixing chamber is a concrete box 6 ft. by 12 ft. partitioned off in one corner of the sedimentation basin by a 12-in. wall, which is again divided into three longitudinal sections, by 3 in. concrete partitions. The 10-in. inlet pipe from the pond leads to the first of these sections, and the incoming water is checked by a float valve, adjusted to keep the water at such an elevation in the coagulation basin, that will assure a head of 2 ft. on the inlet pipes to the filters. The orifice tank also discharges the alum solution into this section. The other two sections contain the baffle boards, which thoroughly mix the alum and water.

Along the east side of the building, three filter beds have been built, each 10 ft. square, designed to filter 200

PLAN AND CROSS SECTION OF COAGULATION BASIN AND PUMPING

concrete in the forms the old retaining wall was an excellent natural platform for the mixer. It was placed about mid-way on the wall, and above it a large wooden bin was built for holding the gravel, with a chute running to the hopper. The gravel was teamed and dumped at the foot of the dam, raised from there in a bucket on a steam derrick, and dumped into the wooden bin. After being mixed, the concrete, from this high point of vantage, could be run in wooden chutes to the forms of the core wall below.

When the wall was completed it was covered up with an earth fill, forming the front of the dam. The material used is a light clay, secured by cutting into the side of a neighboring hill, and teamed to the site. The fill runs out from the original wall at the old road level, to a front 3 ft. north of the core wall, and then slopes down at 2:1 to the floor of the pond, and required some 2,600 cu. yds. of material. This makes a substantial and permanent retaining wall, creating a reservoir of eight million gallons capacity an area of 8 acres. It was necessary to clean the pond of tree stumps and other debris before stemming back the stream.

In providing an outlet or overflow from the pond, a sluice way or culvert was constructed midway across the dam, of the type now generally used in small highway bridges. This culvert has a span of 10 ft., and is designed with a concrete floor in the water way, so that the fall from the overflow might not undermine the footings. Where the wing walls join the main wall on the pond side, a concrete bulk head has been built 4 ft. high, above which slots in the concrete walls allow the placing of 8 in. by 8 in. wooden stop logs, to govern the elevation of water in the pond. At the base a 12-in. pipe and shear gate per-

GENERAL LAYOUT SHOWING POND, DAM AND FILTRATION PLANT

gallons per minute, per unit. Two of these are being equipped at the present time by the Pittsburgh Filter and Engineering Corporation. A layer of gravel 12 in. thick is being laid over the collectors, with 30 in. of sand, 98% silicious material, of a grain size ranging from .40 to .46 millimeters, on top.

Pumps and Tank

Two pumps have been installed, both supplied by the Northern Foundry & Machine Co., of Sault Ste. Marie, Ont. The service pump is designed to deliver 250 gal. per minute against a head of 150 ft. and is run by a 550 volt, 20 h.p. squirrel cage, Westinghouse motor. For fire service, a 500 gallon per minute, 250 ft. head, pump is used, driven by a 100 h.p. Sterling heavy duty gasoline engine.

An elevated tank of unusual height was erected, situated on the same lot as the pump house. From the base of the riser, a 6-in. pipe leads to the clear water well, and by opening the valve the tank can be drained back to the clear water reservoir. This is done when the tank is cut off to give fire pressure, and so increases the fire reserve by the contents of the tank. It was erected by the Canadian Des Moines Steel Co., of Chatham, Ont., is 135 ft. high and holds 60,000 gallons; no leaks developed when tested. It provides a domestic pressure in the village ranging from 40 to 60 lb. per sq. in.

Distribution System

The distribution system consists of 2,593 ft. of 10-in. pipe, 1,658 ft. of 8-in. pipe, 15,263 ft. of 6-in. pipe and 1,944 ft. of 4-in. pipe. The 10-in. and 8-in. mains are used as a main feeder from the pump house to the central part of the town, with the 6-in. mains branching off to serve the different streets; 25 valves being placed and

WEST ELEVATION—PUMP HOUSE AND FILTRATION PLANT

39 hydrants set throughout the system. The F. F. Fry Construction Co. were the contractors for laying the pipes, and did so without having a leaking joint. The only trouble arose from two cracked lengths of 10-in. pipe. The trenching was done by pick and shovel and the filling by a mechanical backfiller.

Cost of System

Construction was started during the second week of August, 1921, and though the plant was not entirely completed, water was supplied to the village on January 31, 1922. The cost of the system includes the following amounts: Pump house and filtration plant, \$16,293; rebuilding of dam, cleaning site of debris, and building culvert, \$10,234; elevated tank, \$8,900; tank footings, \$1,000; filter equipment, \$6,600; pumps, \$5,260; cast iron pipes, \$26,500; laying cast iron pipes, \$12,000; valves, and hydrants, \$3,500. Total, \$90,287.

W. B. Redfern, of James, Proctor & Redfern, Ltd., was engineer in charge of the work. The Council of Richmond Hill, who inaugurated the scheme and were re-elected by acclamation to complete the work, are Reeve, Thos. Trench; Councillors, D. Hill, J. Lunan, J. Batty and J. Monkman.

ENGINEERING IN INDUSTRIAL LIFE

EWART G. HOLMES delivered an interesting address on "Industrial Engineering Service" before the Rotary Club Montreal, recently. Dealing with the function of the modern industrial engineer, the speaker stated that the popular conception of an engineer was that of a man who has the knowledge to design works of large magnitude, while the plans of a building are the function of an architect. The part of the industrial engineer is to close the gap between the two. He must necessarily be an architect, capable of designing and laying out an economical building, and he must also know completely the latest practice of design in lighting and heating. Nor is this all, for he must also be familiar with the scientific requirements imposed by the process of manufacturing.

The development of industry in the last decade has been of a highly competitive and efficient nature. The manufacturer has been forced to give more of his time to economical manufacture of his product, to financing, to credit and sales. This has forced him to seek outside assistance in solving his problems. As a result of this demand there have grown up within recent years organizations which were perhaps primarily architects, possibly primarily engineers, but which have equipped themselves to furnish the manufacturer such assistance as he needs from the point of view of economy of management.

GOVERNMENT HAS NOT CONSIDERED WATERWAY PROJECT

REPLYING to the delegation representing the Montreal Board of Trade, the Shipping Federation and the cities of Quebec and Hull which waited upon protesting against the St. Lawrence-Great Lakes scheme for navigation of ocean boats, Hon. W. S. Fielding acting Premier said the question was important nationally, internationally and financially.

"If you are laboring under the idea that the estimates this year will contain twelve hundred million for this work, I can at once relieve you," he went on. "There is a divided opinion on this project in the States as in Canada."

"The problem has not yet been considered by the Government. I will not say the Government is hostile. If our neighbors want it, the proposals will be fully considered. There will be ample time, however, to receive the representation of all bodies and all currents of view in regard to the principle."

COMMITTEE TO EXAMINE FREIGHT RATES

J. CLARK REILLY, executive secretary of the Association of Canadian Building and Construction Industries, has issued a circular to members of the Association, drawing attention to a recent speech of the Minister of Railways and Canals in which reference was made to the question of freight rates. From a statement made by the Minister, it appears that the Government feels that the matter is of such importance to the people of the country that the entire question should be placed before the members of Parliament in such a way as to enable them to obtain the fullest possible information. The Minister proposes at an early date, to ask the House to appoint a special and representative committee to examine into the question of rates, with power to summon the executives of the various railways and others to place before the committee all available information for the consideration of the members.

Resolutions endorsing the construction of the Water-ton Lakes Reservoir and favoring a Bureau of Standards, were passed at a meeting of the Lethbridge branch of the Engineering Institute of Canada, held recently in Lethbridge, Alta. An interesting address was also given by John Dow, plant chief, of the Alberta Government Telephones, on "Modern Telephone Engineering."

COST KEEPING ON HIGHWAY CONSTRUCTION*

Still in Formative Stage — Some Excellent Systems in Operation — Classification of Cost Keeping Terms Wanted — Basis for Cost System

By A. R. Losh,

Asst. Chief of Construction, U. S. Bureau of Public Roads

FROM an extensive investigation made about six years ago by the Bureau of Public Roads it was found that generally very little cost keeping was done by state and county highway departments on highway work. Where practical and efficient cost keeping existed it was usually found to be on work done by the state highway departments. There was at that time very little interest manifested by public officials in cost keeping on highway work. A similar condition with respect to cost keeping existed to a large extent among road contractors. At this time there had been a long period of almost uniform conditions with respect to labor, materials, types of construction, and processes. The successful contractor had grown up in the business and had rules and methods of his own for estimating, which were based on years of experience and he did not feel the need of cost statistics. The greater portion of the highway work of the time was done by the type of contractor referred to as having his hat for his office and his check book for his cost record of the job. The more substantial contracting organizations and especially those which did not confine their operations to road work exclusively, carried cost keeping records on their road work. As a rule highway engineers attempted to obtain the costs on contract work but generally did not give sufficient attention to the details of cost keeping to obtain complete and reliable data.

It has developed from a recent preliminary study of highway cost keeping conditions that there has been a substantial improvement since the investigations previously referred to were made. In recent years, due to a scarcity of contractors in the highway field, it has been necessary for states and counties to do a large amount of highway work with day labor forces and the value of cost keeping as a check on expenditures and as a guide to efficient management has led to the installation of cost keeping of some kind on this work. In addition to serving these ends, much valuable cost data have been accumulated which form an important part of the fiscal records of the work and have also been used advantageously in placing other work under contract. The advantages of keeping cost of day labor work are generally recognized but there are divergent views with respect to keeping costs of contract work. As a result it will be found that with one state highway department cost keeping of contract work is incidental to the inspection and the resident engineer or inspector is to considerably extent left to his own devices in this regard, while with another state highway department the cost keeping is one of the important functions of the residency and not considered a sideline by any means.

When the cost of contract work is considered advantageously the method followed is either to select the jobs which will supply the information desired or to cover the entire program and keep costs of all contracts. In either case there should be a sufficient force available to handle the inspection and cost keeping properly. It will be difficult if not impossible to secure satisfactory results unless the inspectors or cost keepers receive specific instructions as to what they are to do, are supplied with standard recording and report forms, and their cost keeping supervised as well as their inspection work. It is not meant to infer that cost keeping is of the same importance as the inspection of the construction, but that if cost keeping is to be carried out at all it should have more than casual attention from the administrative authorities.

The advantages resulting from keeping costs on contract work are usually given as follows:

2. The department has available necessary cost data for making settlement with contractor where unforeseen conditions are involved.

3. Engineers and inspectors receive training in use of cost data and making up of estimates.

4. Provides a means for analyzing cost of work which may lead to development of more economical designs and methods.

5. In some cases of assistance to the contractor who may not even have an adequate cost system.

The Bureau of Public Roads has abandoned the practice of keeping costs of all of its contract jobs but is instead keeping costs of all day labor work and of such contracts where it is thought the data will be advantageous to the Bureau. It will prove advantageous to a state highway department to collect cost data on a number of representative contracts each year as a general check on the cost of its designs and also to determine the margin of profit contractors are getting.

The increasing use of cost keeping by contractors is even more pronounced than in the case of the state and county organizations. This is due principally to the unsettled conditions during the past three years which have made estimating more difficult and rendered as practically useless many cost data and hypothetical rules used a few years ago. New construction methods, and especially those processes requiring a more extensive use of equipment have also increased the need of cost keeping. Possibly the increasing number of engineers in the contracting field has had some effect in turning contractors to cost keeping. It will be found that highway contractors are now working individually and through their organizations for more systematic and business-like methods in estimating work and in the keeping of construction costs. While no uniform method for keeping highway costs has as yet been suggested by contractors' organizations, practically all contractors are now keeping costs on their work. Some of the systems are almost of the check book class in simplicity but they vary from this to a codified system of accounts divided and subdivided to collect cost of labor, materials, equipment and supervision on various operations. It appears that the present tendency is for highway contractors to develop cost keeping systems comparable with those in use by the building industry.

Primary Purpose of Cost Keeping

The primary purpose of cost keeping is to ascertain the actual cost of production. Not what the cost should be, but what it is. For a contractor's use the cost system should furnish reliable data on current costs. In this way a periodic check on the cost of the work, which is an indication of the efficiency of the organization, is available as a managerial aid to the contractor or his superintendent. This function of a cost system is of special value on highway work where there are usually a number of operations under way simultaneously on different parts of the job and in consequence all of the workmen are not continuously under the observation of the superintendent. Next in importance to the contractor is the value of cost data as a guide for estimating future work. The increasing complexity of highway construction is making cost keeping of more importance. The large sums of money now involved in road contracts mean more items of work, new processes, and additional operations over former requirements. To estimate the cost involved without comparable cost data is becoming too costly a hazard. It is not enough to know that there was a net profit on the job, but in order to use the data for estimating purposes it must be known by items and operations, the actual cost of production.

In the construction industry it is not practicable to determine unit costs with the precision and refinement that obtains in the manufacturing industry. This is due to the variable nature of the construction product and the frequent change of conditions. Also, since conditions are not identical on any two jobs cost data from one is only an approximate comparison for another. For these reasons cost data must be used as a guide or measure in forecasting

(*) Paper read at American Water Works Convention, Cleveland.

1. Valuable cost data are secured which may be used for estimating purposes. Cost data on new or unusual methods of construction and on the use of various plant units are of particular value as similar conditions are likely to be encountered in the future and a basis for cost estimates is available.

Basis for Cost System

It is believed that the proper basis for a cost system is the four principal elements of cost allocated to the units of production.

- (a) Labor costs.
- (b) Material costs.
- (c) Equipment costs.
- (d) Administration costs or general expenses.

The products of highway construction to which these cost elements are assignable are road parts. Fundamentally these parts are:

- (a) The right of way.
- (b) The roadside, shoulders, and grade.
- (c) The travelled way or roadway proper.
- (d) Drainage channels or ditches and drains.
- (e) Drainage structures or bridges and culverts.
- (f) Supplementary structures or miscellaneous road parts, such as guard rails, retaining walls, guide posts, etc.

Thus, there are six major products on each of which there may be four elements of expense or cost; consequently, we have 24 cost divisions. Since general expense is not ordinarily ascertained directly on production but is prorated to the various operations, the actual cost divisions with which the cost keeper is directly concerned are reduced to 18. It is believed that this is the minimum number of cost divisions which will provide a satisfactory highway cost keeping system. These cost divisions are susceptible of much further analysis by breaking them up into various operations. For example, a square yard of concrete roadway is one of the unit products. The cost divisions for this are three, i.e., labor, materials, and equipment. To these three may be added the prorated general expense. For further analysis, this square yard of roadway may be subdivided into sub-grade finishing, placing of forms, hauling materials, mixing concrete, placing concrete, curing concrete, etc. This illustrates how the system may be expanded to meet the requirements of any desired analysis.

In placing the cost items against the appropriate construction items the greatest difficulty appears to be in correcting with "equipment costs" and "administration costs." It is the experience of the Bureau of Public Roads on its own work that these items are given less attention in the preparation of estimates and in the segregation of cost to construction items than the more nearly definite items of "labor" and "materials."

The handling of equipment costs has been greatly simplified by the use of a rental factor computed to cover fixed charges, depreciation, overhauling, lost time, storage, and supervision. In the case of its own plant the Bureau has prepared rental schedules for all units of equipment having a useful life or more than one working season and costing more than \$25. Small tools and those which are usually worn out on one job are handled the same as materials. This plan has been in operation three years and except for a change from a monthly to a daily basis it is practically the same as originally developed. It has proven satisfactory on both day labor and contract work of the Bureau. A rental factor of this kind is necessary where current costs are determined for purposes of management. If greater accuracy is desirable for fiscal purposes and annual appraisal of the equipment may be made and the depreciation, repair, storage and other charges prorated to the projects which have used the equipment.

As general expense is not usually assignable directly to units of construction and many of the expenditures do not come to the attention of the cost keeper on the job there is a tendency to overlook this element until the project nears completion, at which time the cost is prorated to the work completed. The result is a sudden jump in unit costs. Even with this apparent defect this may prove the best method

to adopt as it greatly simplifies the handling of general expense items. Where limited funds require careful attention to gross expenditure on a project this method is not recommended. Occasionally it is found that the general expense is quite high in starting a job and if this is prorated to the small accomplishment during the first few weeks of the work there are shown abnormally high unit costs which are not a true indication of conditions. Two suggestions are offered for the handling of general expense. First, it will be found advantageous to divide general expense into two parts, one of which includes those costs which are assignable directly to the project and the other the general administration costs of the organization which must be prorated to all its various projects. This latter part need not be considered in current cost reports as it does not in any way affect the efficiency of the construction organization on the project. This part of the general expense may be apportioned to the project upon its completion. The second suggestion is that the amount of general expense (project) taken up and prorated on current reports be a percentage of the total probable general expense, which percentage to be not greater than the percentage of the project completed. For example, if the project is only 10 per cent complete, prorate to completed work not more than 10 per cent of the total probable general expense. On projects where the cost of "moving in," "camp installation," "organizing," and "disorganizing" is of a considerable amount the unit construction costs are liable to be materially affected if this entire cost is distributed before the work is well under way.

Fundamental Principles of Cost System

A cost keeping system to be successful must be based on certain fundamental principles. First of all it must be designed to furnish the particular information sought. This feature can not be too strongly emphasized as not infrequently much more time is spent in perfecting quasi-scientific forms, codes, and procedure than is given to working out a cost system for getting at the cost of doing work. The system devised must be reliable and accurate to a practical extent. In-so-far as field procedure is concerned simplicity is a very important consideration and it should be such that the required data can be successfully compiled by foremen and timekeepers. The effectiveness of the system will depend to a great extent on the celerity with which the unit costs may be ascertained. Unless the cost of doing the work can be determined easily and promptly its value as an aid to efficient management is lost. Some consideration should be given to making the cost system adaptable to the general work of the organization and not design it entirely for an individual job or set of conditions. It requires time and considerable patience to get a system in working order and frequent changes in forms and instructions should be avoided as they are generally disconcerting to the men in charge of construction work. It must be understood that cost keeping lies in the general book-keeping scheme of the organization and is not to be operated independent of the regular accounting. While the cost-keeper and bookkeeper make different use of the information, the basic data used should be the same. One of the reasons cost keeping has not received more encouragement in the past from engineers and contractors has been the question of its cost. A system laid out along the lines indicated and designed to give the information needed for the proper supervision and administration of the work of an organization need not be expensive considering the volume of business it handles. It is when a system is developed beyond the requirements of the organization that cost becomes an important consideration.

A review of the present status of cost keeping on highway work indicates that it is still very much in a formative stage. There are some excellent systems in operation in many of the state highway departments and among the larger contracting organizations, but on the larger part of the extensive highway program cost keeping as practiced leaves much to be desired. A great step forward would be accomplished by a general classification of cost keeping terms. Many of these as are used are subject to several in-

interpretations. Engineers and accountants could materially improve the situation by reaching a common understanding in this regard.

As an indication of the present interest in highway cost keeping it is interesting to note that since the publication by the Bureau of Public Roads of its Cost Keeping Bulletin more than five thousand copies have been distributed.

TOWN PLANNING INSTITUTE MEET

PRELIMINARY arrangements have been made for the Third Annual Meeting of the Town Planning Institute of Canada which takes place at the Chateau Laurier Ottawa, on Friday and Saturday, May 12 and 13. The tentative program is as follows:

Friday, May 12

2:30 p.m.—Council meeting.

5:00 p.m.—Registration and annual business meeting.

Reports.

Constitution.

By-laws.

7:00 p.m.—Annual dinner.

President's Address: In the absence of the President, Dr. E. Deville, the address will be delivered by the first vice-president, Noulan Cauchon.

Brief Addresses by: Mayor Plant of Ottawa; Hon. Rodolphe Lemieux, Speaker of the House of Commons; Senator Fowler; Thomas Adams, past president of the Institute.

Announcement of election of new president and officers.

J. P. Hynes, Chairman of the Ontario Town Planning and Housing Association—"Where the Responsibility for Town Planning Belongs."

Saturday, May 13

10: a.m.—Papers.

(1) "The Suburban Problem," W. E. Hobbs, director of town planning, Province of Manitoba.

Discussion.

(2) "Town Planning Point of View," T. D. Le May, City Surveyor of Toronto.

Discussion.

(3) "Zoning," Thomas Adams.

Discussion.

Lunch: Round Table.

3:00 p.m.—Open.

CANADIAN SECTION A.W.W.A. BRANTFORD MEETING

SEVERAL interesting papers are on the program which has been arranged for the annual meeting of the Canadian Section of the American Water Works Association which meets at the Kirby House, Brantford, Ont., on Friday and Saturday, May 12-13. The program is as follows:

Friday, May 12

2:00 p.m.—General Business.

Election of Officers for 1922-3.

3:30 p.m.—"Government Control of Sewage," by F. A. Dallyn, sanitary engineer, Department of Public Health, Ontario.

4:30 p.m.—"Filter Plant Construction," by R. L. Dobbin, Waterworks Superintendent, Peterboro, Ont.

6:30 p.m.—Banquet at Brantford Golf and Country Club.

Saturday, May 13

9:00 a.m.—"Treatment of Impure Hard Water," by William Gore, of Gore, Nasmith & Storrie, Toronto.

10:00 a.m.—"Manufacture of de Laval Cast Iron Pipe," by Professor Gillespie, Toronto University.

11:30 a.m.—"Standardization of Hydrant Threads," by Norman McL. Wilson, chief engineer, Brantford Water Works.

In connection with the convention, manufacturers of water works equipment and supplies are putting on an exhibition in a room adjoining the convention hall. Those

manufacturers who have not yet sent in registration for space (which space is to be provided free of charge) are advised get into touch with Norman McL. Wilson, chief engineer, Brantford Water Works, or Mr. Jordan, of Dominion Steel Products, Ltd., Brantford, who are in charge of this feature of the convention.

DIESEL ENGINE EQUIPPED SHOVEL

AFTER a long period of thorough experimentation, the Bucyrus Company of South Milwaukee, Wis., has developed a Diesel engine equipped shovel. The importance of this announcement lies principally in one outstanding fact, the fuel cost. This shovel, known as the Bucyrus 30-B oil shovel, will use as fuel, any cheap low-grade oil of high heat value which will flow freely.

The saving in the cost of fuel thus obtained is considerable. This machine has been under severe test for several months, under strenuous winter conditions, both as a shovel and as a dragline. These tests have shown that with fuel oil at 6c. per gallon this machine will consume 1 1/4 to 2 1/4 gallons of fuel oil per hour. This means a fuel cost of 10 1/2c. to 13 1/2c. per hour, or, roughly, between \$1 and \$1.25 per day of average operation.

The economies thus made possible to a shovel or dragline operator may be realized by comparison with a steam shovel of the same size. All practical men know that the fuel cost of any shovel differs widely in different sections of the country. Conservatively stated, however, such a shovel will burn about 1 1/2 tons of coal in 10 hours. With coal at \$6 per ton delivered, this means a daily fuel cost of not less than \$9. A saving of \$8 per day on fuel alone is thus possible. To this figure may be added the saving made possible in not having to pay for hauling water and coal.

The engine is of the full Diesel type, known as a mechanical injection engine, developing 55 h.p. at the conservative speed of 360 r.p.m. The cylinders are 8 in. by 10 1/2 in. It is a heavy duty, slow speed engine of particularly rugged and heavy construction, adapted well to the severe service it must undergo in excavation work.

The Diesel type engine differs from the gasoline engine principally in that it is a constant pressure engine, the fuel being burned directly in the cylinders without the aid of a carburetor, spark plug or outside heating appliances. In the gasoline engine the mixture is taken into the cylinders, compressed, and then ignited by some auxiliary mechanism. The pressure then rises in the nature of an explosion. In the Diesel type engine the fuel is injected into the cylinders at a constant pressure in an atomized state. It is fired by the heat developed by the compression of air in the cylinders on the previous stroke. Thus the sudden pressure due to the explosions in the gasoline engine is eliminated, making the engine steadier running and easier to maintain. The 30-B oil machine, equipped with a Diesel engine, may be furnished either as a shovel, a dragline, a clamshell or a locomotive crane. The Bucyrus shovel is handled by Musens Limited, Montreal.

EXPENDITURE ON MANITOBA ROADS

FROM a report of the Manitoba Good Roads Board, recently issued, it is shown that expenditures to the amount of \$906,244 were made by the municipalities and the Province of Manitoba on roads which are entitled to Federal aid under the Canada Highways Act from the inception of the act in July, 1919, to September 30, 1921. Nearly all of this sum has been approved by the Federal auditor for payment to the Province of the Dominion's share of 40 per cent.

The report states that Manitoba's share of the \$20,000,000 appropriated by the Parliament of Canada to aid Provinces under the act, is \$1,602,265, but according to the terms of the act no portion of this money can be received by the Province on expenditures on roads which have not been placed under agreement for improvement by the Minister of Railways and Canals, Canada, and the Minister of Public Works of the Province.

BRADFORD, ENG., WATER SUPPLY

Supply From Impounding Reservoirs — Economy of Soft Water For Industrial Purposes — Comparison of British and American Consumption.

IN dealing with the history of the Bradford (England) water supply, Lewis Mitchell, water works engineer, gives some very interesting data. The water supply of Bradford has been municipally owned since 1855. The city originally obtained its supply from the Aire Valley, going further afield as the necessity arose. The corporation tapped sources in the Wharfe Valley, and finally the valley of the Nidd. The Nidd River rises in Great Whernside, one of the highest peaks of the Pennines, and the supply is drawn from a point of high altitude from which the water can be delivered by gravitation to a high level in Bradford.

The area of the corporation's watersheds is 26,080 acres. Six reservoirs, viz., Angram, Upper and Lower Barden, Chelker, Thornton Moor and Stubden, are used solely for impounding water for city supply; and seven reservoirs, viz., Hewenden, Grimwith, Silsden, Doe Park, Leeming, Leeshaw and Gouthwaite have been provided to compensate the owners and occupiers of lands and mills and other parties interested in the sources from which the water has been diverted. With the exception of the water drawn from Stubden Reservoir and Manywells Springs, the whole of that supplied by the corporation is filtered before it is delivered to the city. The Barden supply is filtered at Gilstead, the Nidd supply at Chellow Heights, and the Thornton Moor Supply at filters which are contiguous to that source.

All sources of supply are initially dependent upon the rainfall. There are no fewer than forty gauges on the Bradford Corporation catchment areas. In Britain the rainfall varies from about 20 in. in the eastern counties to 130 in. per annum in the hills of Cumberland, Wales and Scotland. On the corporation's watersheds it ranges from an average of 32 in. to 54.4 in. as compared with the average of 39.5 in. for the British Isles.

The water thus obtained is comparatively soft, having only 2.5 degrees of hardness as compared with 1 degree in Glasgow, 3 degrees in Manchester, 7 degrees in Edinburgh, 15 to 20 degrees in London, and 30 degrees in Sunderland. This is an important characteristic, because when trades such as wool-washing, dyeing, bleaching, tanning and calico printing are extensively conducted, a soft water is a necessity. For trade, manufacturing and boiler purposes, it is unrivalled. When it is remembered that iron conducts heat eighteen times better than calcium carbonate, and fifteen times as readily as calcium sulphate, and that 1/6 in. of scale on a boiler necessitates the use of 16% more fuel ¼ in. 50%, and ½ in. 150% additional coal, the value of a soft water will be appreciated. The only manufacturers who require a water with permanent hardness are the brewers, who, for brewing light colored beers, actually add gypsum when the water is deficient in that ingredient. For domestic use a soft water has also many advantages, there being a considerable saving effected in the cost of soap, soda and tea required.

In a surface water supply which is close to inhabited centres, it is difficult to prevent pollution at the source. Consequently many large towns and cities have gone considerable distances for supply rather than use one of doubtful purity. Manchester went to Thirlmere and Haweswater (a distance of 100 miles), Glasgow to Loch Katrine, Liverpool to Vyrnwy (66 miles) and Birmingham to the Elan Valley (80 miles).

There is little question as to the desirability of filtering a surface water supply before delivering to consumers. Manchester and Glasgow are the only large water authorities in Britain that have not made this provision. Prolonged storage has undoubtedly a beneficial effect, but in relatively small reservoirs the clarification effected is far from adequate. In Bradford the total extent of the filtering area is in excess of 8 acres. The filters in use are of the

slow-sand type, and consist of a water-tight basin containing a layer of fine sand from 2 to 3 ft. in thickness, supported by a layer of gravel or broken stone in graded sizes from 6 to 12 in. in depth, below which are the underdrains.

The action of the filter is entirely biological, depending on the thin, slimy and gelatinous film formed on the surface. The lowest chemical and bacteriological efficiency is recorded immediately after cleaning, and if the rate of filtration is regular and continuous, the degree of purification effected gradually increases. The rate of filtration is two million imperial gallons per acre per day.

From the filters the water is discharged into service reservoirs, of which at present only three are covered. The covering of these reservoirs was found necessary to prevent the growths of algae and infusoria, and their subsequent entrance into the city supply. From the service reservoirs the water flows by gravity to the distribution system.

Water supplied for domestic purposes is charged for by a rate levied upon the gross annual value or rack rent of the premises so supplied. The water used for other purposes, such as trade or manufacturing, is metered, a charge being made for each thousand gallons so delivered.

In Bradford with a population of 400,000, the consumption is now 18 million gallons per day, with an average daily per capita consumption of 46 gallons. Of this latter amount one-half is used for trade and manufacturing purposes. In London the daily consumption is 34 gallons, in Manchester 36, and in Glasgow 60. The average for the principal towns in Britain is 35 gallons, ranging from 18 in Norwich to 80 in Paisley. New York requires 100 gals. and Washington 150 the average being nearly three times as high as in Britain.

CHANGE OF DATE FOR GOOD ROADS MEET

IN order to make it concurrent with the provincial meeting of the Engineering Institute of Canada, the date of the ninth annual meeting of the Canadian Good Roads Association has been advanced one day. The good roads convention will now be held at the Empress Hotel, Victoria, B.C., on Monday, Tuesday, Wednesday and Thursday, June 12, 13, 14 and 15, while the meeting of the Engineers will be held at the Vancouver Hotel, Vancouver on June 16 and 17. The members of the Engineering Institute will attend the Good Roads Convention in Victoria and the delegates to the latter will at the conclusion of their labors return to Vancouver and assist at the Engineering meeting, it being realized that the two organizations have much in common, and can be of much assistance to each other.

The special summer tourist fares will be in effect so that the railway fares will be much less than the ordinary rates. The return fare from Halifax will be \$170.75, Charlottetown, P.E.I., \$169.55, St. John N.B., \$163.25, Quebec City, \$142.45, Montreal, \$132.30, Ottawa, \$126.55, Toronto, \$109.55, with pro rata rates through the prairie provinces to the coast. These fares will be on either the Canadian National Railway or the Canadian Pacific Railway, while those delegates wishing to return via San Francisco can do so at an approximately additional cost of \$20, or via Prince Rupert for an additional \$13.

The Canadian Good Roads Association officials have been assured that every province in the Dominion will send official delegates to the convention, while many of the municipalities that have participated in past conventions, and realized the great value of the papers and discussions that take place at them on highway problems, are sending their officials to Victoria, feeling that the expense incurred will be more than offset by the savings they can later effect in road construction and maintenance through the knowledge gained at the convention.

The President of the Association, the Hon. S. J. Latta, Minister of Education in the Saskatchewan Government, will preside at most of the sessions, and so important are the subjects chosen for discussion that the Executive have for the first time extended the convention, from three to four days.

2000 feet of cast iron or steel pipe near the lake and the balance of the pipe line of woodstave pipe. An intermediate reservoir was to be provided at a point about two miles south of the City. This was to be a reinforced concrete covered reservoir with a capacity of 300,000 gallons. Its purpose was to equalize the load on the pumps and to provide for keeping the wood pipe line full of water at such times as the present plant would supply all the water necessary.

The general idea of the scheme was based on the fact that the existing water supply of the City could be depended on for a minimum of 1,500,000 gallons per day for five months of the year, during the other seven months the supply being ample for present needs. Lake Erie

FIG. 3—KETTLE CREEK DAM, DIAGRAM, SHOWING PROFILE OF CREEK BED AND CORE WALL EXTENDING INTO BANKS

scheme therefore would act as an auxiliary supply the raw water being pumped untreated and would be filtered in the present filtration plant.

The capital cost of the scheme including pumping plant, intake, intermediate reservoir, pipe line and right of way was estimated at \$450,000 with annual charges for interest, sinking fund, and operation and maintenance of \$59,000.

As the present annual revenue from all sources is only \$60,000 per annum, it is seen that water rates would have to be at least doubled to finance the Lake Erie scheme. Consideration was therefore given to the development of the Kettle Creek watershed.

Precipitation and Run Off Investigations.

As in common in most smaller cities the officials had never seen the necessity of keeping records that would be of value in investigating a problem of this kind. The only really authentic information available being the pumping records during the dry summer of 1919. It was known that during this season the storage was being slowly reduced. Considering the dependable flow from the wells at 1,000,000 gallons per day it was estimated that the minimum flow of the creek during the summer was approximately about 500,000 gallons per day or less than one cu. ft. per second.

The paucity of information with which to work compelled Mr. Lea to make a most exhaustive inquiry into the subject of rainfall and run off in Western Ontario. Records were kindly furnished by the City of London, Hydro-Electric Power Commission, Water Power Branch of the Dominion Government, and the various Meteorological stations in Western Ontario.

Records of the monthly precipitation at Paris, London, Guelph, Georgetown and Port Stanley from 1893 were compiled and studied carefully in conjunction with the run off records for the period 1914-18 inclusive of the Speed River at Hespeler, the Thames River at Ealing, the Grand River at Belwood and the Credit River at Cataract Junction.

It was found that for the four years the total run off varied on the different watersheds from 12.23 inches to 14.79 inches, the average of the four watersheds for the five years being 13.23 inches.

The lowest run off recorded for any one year was for the Grand River at Belwood it being 6.15 in. for the year, 1.41 in. for nine months and 0.42 for six months. Assuming that the monthly records of run off for this low year would apply to the Kettle Creek watershed, the average flow in gallons per day of Kettle Creek would have been

June 780,000, July 260,000, August 520,000, September 520,000 gallons per day.

Having regard for the fact that the run off of the Grand River as compared with the next lowest run off recorded in Western Ontario is less than one third for the six months period, less than one half for the nine months period and about 80% for the year, and also having regard for the fact that the lowest recorded monthly run off of the Grand River little more than half of the lowest known runoff for Kettle Creek in proportion to the watershed area Mr. Lea assumed that the run off for the Kettle Creek watershed could be safely assumed to be at least as great as that of the Grand River at Belwood.

Total Daily Supply.

A detailed analysis on this basis gave 25,000,000 gallons per day as a yearly average, with a safe average of 2,000,000 gallons per day over a nine months period. To supply an average annual demand of 4,000,000 gallons per day would require about 4,500,000 gallons per day during the summer months. Allowing for evaporation and other losses, it was proposed, therefore, to provide a storage of 350,000,000 gallons. This, together with the 1,500,000 gallons per day already available, would give a minimum daily supply of 4,000,000 imperial gallons. The construction of a dam at some point north of the city, therefore, became necessary.

Jas. A. Bell, who has had long experience with the geology of this district, was called in at Mr. Lea's suggestion. Mr. Bell located a suitable foundation at a point about one mile north-east from the pumping station. Here an underlying strata of very hard blue clay, known locally as hardpan, was encountered a few feet below the creek bed. Artesian wells in the vicinity shewed this strata to be about 70 ft. deep.

Two Steel Bridges Raised.

The selection of this location made necessary the raising about 10 ft. of a 90 ft. 80 ton steel highway bridge located about 120 ft. upstream. It was first thought that the approaches to the bridge might be used as an earth section, and that the spillway might be constructed immediately under the bridge. Investigation shewed, however, that the concrete section of the work would thus have been made unduly expensive.

One mile upstream a second steel bridge was dismantled. This bridge served only one farm and the acquisition of that farm by the city, offered the easiest solution here. A second highway bridge about two miles

FIG. 4—KETTLE CREEK DAM—POURING NORTH CORE WALL

upstream, could not be so easily disposed of. The raising of this bridge a distance of seven feet involved the reconstruction of the abutments and the making of about 8500 cu. yds. of embankment.

The width of the basin averages about one-quarter mile from top to top of hill, the top land being about 70 ft. above the creek. It was necessary for the city to purchase the total width, resulting in the acquisition of

about 450 acres of land requiring about 1400 rods of fencing to enclose. The actual flooded area is about 160 acres, most of which required considerable clearing.

Figure 3 shows a profile of the creek bed and the materials encountered at the site of the dam, all being exceptionally suitable for the foundation of the structure.

Details of Dam.

To take care of the greatest possible flood flows, a spillway section 90 ft. wide and 8.5 ft. high, was decided upon, with the crest of the spillway at elevation 48.50. This was calculated to provide a storage capacity of 400,000,000 gallons and had the effect of raising the water 17½ ft. at this point and created a reservoir extending 3½ miles upstream from the dam.

The dam consists of an earth embankment with a 12 in. concrete core wall on either end of the spillway section. This is of the ordinary type of gravity section and is designed to give a maximum toe pressure of 2½ tons per sq. ft., with piers and stoplogs, these latter being required when additional storage has to be provided. The ends of the embankment, both up and down stream, are supported by reinforced concrete wing walls. These are shown in detail on Figure 1. The water course is paved immediately down stream from the spillway, the paving or apron terminating in a down stream cutoff.

Figure 3 shows the core wall cut-off extending into the banks, at the same elevation as the cutoff across the bed of the spillway, and then sloping up at a depth of 2 ft. below the hardpan or blue clay. The top of the earth section is at elevation 57, providing a 6 in. covering over the core wall, and is 12 ft. wide on top, with 2 : 1 slopes and paved on the up stream side adjacent to the south wing wall.

No sluiceway section is provided, control of the water being accomplished by the operation of flanged sluice gates with non-rising stems, located in the 4 ft. x 8 ft. gate chambers in the abutments. In the south chamber are one 16 in. and three 12-in. valves as inlets at elevations 31.5, 34, 40 and 46 respectively, and one 16 in. outlet valve at 29.5. In the north chamber is one 24 in. valve controlling the inlet at 31.4, while the 24 in. outlet at 29.7 has no valve.

Cost of Construction.

The contract was let on a unit price basis, to the Webster Construction Co., of London, Ont., the lowest

materials were washed away. The loss at the pumping station a mile below, was very heavy, as the creek broke through its banks and rushed 3 ft. deep over the pump house floor, only subsiding after about six hours.

The coffer dams were rebuilt and the creek flow taken care of by a diversion dug along the north bank, as shown on Fig. 1. This width represented one cut of the Keystone excavator with dipper attachment, and the flow of the water soon doubled the width.

Excavating in the base of dam and wing wall footings was carried out with the Keystone excavator. The material was exceedingly hard, and from July 28, to Aug. 22, was required for this work, the material being hauled into

FIG. 6—KETTLE CREEK DAM ON JAN. 19-1922

the embankment of the approaches to the bridge, just above the dam.

Progress of Concrete Work.

1 : 2 : 4 concrete with 1½ in. stone was used in wing walls, footings, apron, in the faces and top 6 ft. of spillway, and in the core walls, while 1 : 3 : 6 concrete with 2½ in. stone was used in the cutoffs, and interior of the spillway, the base to elevation 28, and the core wall footings. An 11 cu. ft. steam-driven batch mixer turned out 10 cu. yds. of concrete per hour under good conditions.

The first concrete in the dam was poured in the south wing wall footings on Aug. 23, and by Sept. 2 all the wing wall footings and base of dam were completed. The south wing walls were poured to elevation 48.5, the south-west wing and gate chamber walls being poured monolithic with a 5 ft. section of the spillway. This method was also employed on the north side. The central part of the spillway was poured in three sections, each about 27 ft. long, each section being poured in three lifts and completed to the crest before another section was started.

6 in. x 12 in. keyways were left and a crimped copper strip was placed 12 in. from the face, in all vertical joints. By September 30, the spillway was completed and on Oct. 14, the wing walls and gate chamber were poured. The valves were then placed in the gate chambers, the diversion closed off and the core walls proceeded with. The first concrete in the core walls was poured on the north side on Oct. 17, the last section being completed in the south core wall on Dec. 2. As the walls went up the embankment was built from material excavated from borrow pits.

An unfortunate feature of the work was that the year decided upon for construction brought not only the greatest flood on the Creek in the memory of any one now living, but floods in greater numbers than for several years. Five floods washed over the coffer dam in September, rising rapidly during the night.

The total excavation involved the moving of 11,000 cubic yards of earth work, while 2300 cubic yards of concrete and 23 tons of steel were required.

The total cost of the Dam, including engineering, was approximately \$70,000. The raising of the two bridges involved an expenditure of \$11,000 each.

The design of the dam was made by W. S. Lea and Messrs. James A. Bell & Son, the latter firm supervising

FIG. 7—KETTLE CREEK DAM PART OF FIRST SECTION SPILLWAY POURED

bidder in a field of seventeen. Approximate quantities for the eight main items were supplied the tenderers, and on these the bids ranged from \$44,738 to \$105,830. The contractor began work on July 4, 1921, and was practically complete by the first week of January, 1922. Earth coffer dams were started across the creek and these were about 30% completed when the greatest flood in the history of Kettle Creek took place, the creek rising 10 ft. in twelve hours, reaching a flow of 7000 sec. ft. on the morning of July 10. The coffer dams and a considerable quantity of

the construction. The raising of the bridge immediately upstream from the dam was also carried out by James A. Bell & Son, while the second bridge was raised and abutments re-constructed from designs prepared by W. C. Miller, city engineer of St. Thomas. George H. Chalmers was resident engineer on all three projects. The Water Commission consists of Albert Roberts, Chairman, George Geddes and the Mayor of St. Thomas.

REGULATION AND TESTING OF LARGE MODERN HYDRAULIC MACHINERY

AT THE symposium of hydraulics recently held at the University of Toronto, two lectures were given by Norman R. Gibson, hydraulic engineer of the Niagara Falls Power Co. His first lecture dealt with the regulating and testing of hydro-electric machinery, and his subject was presented in a very lucid and entertaining manner. He pointed out how regulation of the power-house machinery is a very vital requirement of a company delivering power, as both variation in voltage and frequency may be the cause of considerable loss to the customers. This is especially true in the case of paper manufacturers.

When the governor of a turbine adjusts the speed for any given load change, it performs the function of acceleration or retardation of the water column in the penstock; in this it is assisted by the fly-wheel effect of the revolving parts of the generator and turbine.

In reference to the testing of installed apparatus, Mr. Gibson pointed out how this is not so much a necessity for checking up the manufacturers' guarantees as it is for indicating to the owner of the plant how the machinery is standing up under service; testing thus becoming a periodic requirement of any operating plant. Results of periodic tests indicate the advisability of making repairs, renewing runners, and in every way keeping the plant up to its maximum state of efficiency.

The difficulty of making exact measurements of any physical quantity was discussed by Mr. Gibson, and where the quantity to be measured is in three dimensions, such as the quantity of water, the problem is correspondingly more difficult. When the time element is also introduced, such as is required when the rate of flow has to be measured, further complications are encountered. The accepted method of measuring flow, such as by venturi meters, pitot tube, weir and chemical gauging, are all capable of giving satisfactory results, said Mr. Gibson, but when it came to determining the flow in the large modern plants, these methods are often both expensive and difficult. The necessity for obtaining accurate means for readily determining the efficiencies of large turbines, led to the investigation which resulted in Mr. Gibson's invention for measuring the flow of water in penstocks.

The arrangement of the measuring apparatus and its connection to the penstock were described and shown by slides. The method consists in obtaining an accurate photographic record of the change of pressure in a penstock when the flow is shut off, the rise of pressure for a period of time being an exact measure of the velocity of water flowing up to the time it was shut off. A photographic record obtained by the apparatus indicates the pressure-time area, and at the same time the scale of time is accurately shown by means of a record of a swinging pendulum obtained simultaneously with the photograph of the pressure rise.

UTILITIES COMMISSION WATER WORKS PROJECT.

FROM a report upon the water works project submitted to the Essex Border Utilities Commission by J. Clark Keith, it is understood that filtered water could be supplied to the property owners of Windsor, Ont. at 2½¢. per 1000 gallons in excess of the rate in effect at present. The report will be considered at a special meeting of the Commission at which representatives of the Walkerville Water Co. and the Windsor Water Commission will be present.

It is proposed to have the border municipalities submit three questions to the ratepayers if it is decided to go through with the scheme. The first so far as Windsor is concerned, would be, in effect: Do you want filtered water; if so, do you want Windsor to instal a filter of its own; or, do you want the city to enter the union scheme advocated by the commission?

The report deals solely with the cost of supplying filtered water at the pumping stations of the Walkerville Water Co. and the City of Windsor.

In making this report there has been no departure from any of the principles adopted by the board, nor any changes in the quantities involved, except in minor instances. The board included in its figures the cost of a high lift pumping station at Strabane avenue for purposes of comparison with that of a complete filter plant and high and low lift station at the Windsor waterworks. Until the expiry of the franchise of the Walkerville Water Co. in 1952, or unless a fusion of all the border municipalities shall have become an accomplished fact before that date there will be no change in the operation of the existing waterworks system prior to that time. For that reason, a low lift station only, would be constructed at Strabane avenue at the present time, and either oil or gas would be utilized as a standby, instead of steam.

A revision of the estimates submitted by the engineers' board on the cost of an intake, low lift pumping station, filtration plant, and pipe line for conveying filtered water to the suction wells or piping systems of the Walkerville Water Co. or Windsor Waterworks has been made in detail in accordance with present day prices. Before adopting any of the unit prices used in this report, conferences were held with officials of the Walkerville Water Co., and they concurred in the basic figures used.

An effort was made to effect a similar arrangement with the Windsor Water Commissioners, but they were not in a position at the present time to discuss any elements of cost.

NEW PUMPS FOR CITY OF MONTREAL

THREE single-stage centrifugal pumps, each having a capacity of 30,000,000 Imperial gallons per 24 hours, are being built for the Montreal Water Board at the shops of the Dominion Engineering Works, Ltd., Montreal. These pumps will be installed in the Atwater St. Pumping Station and will operate against 250-ft. static

SHOP VIEW SHOWING PATTERN AND CORE BOX FOR UPPER AND LOWER CASING OF 30,000,000 GAL. SINGLE-STAGE CENTRIFUGAL PUMP FOR MONTREAL WATER BOARD

head. They will be driven at 625 r.p.m. Each pump will be direct connected to a 2,000-h.p. motor. Among other equipment which the Dominion Engineering Works are supplying to the Montreal Water Board are 4,000,000 lb. of special 36-in. cast iron flanged pipe and fittings and 42-in. pipe and fittings, and six 42-in. gate valves

ELECTRICAL OPERATION OF GATE VALVES*

Valves Closed Quickly in Emergency — Prevents Flooding and Consequent Damage to Property — Description of Dean System of Valve Control.

By Peter Payne Dean

FIVE years ago the electrically operated valve was almost a thing of the past, its development having entirely stopped in favor of cylinder operation, but since that time it has again come to life and is now making rapid strides, threatening seriously to eliminate cylinder operation for almost every use, and entirely, where distant control is required.

A large gate-valve, after having been installed for some years and without much care, becomes exceedingly hard to operate and sometimes requires the efforts of six or eight men to close. Being difficult, and requiring so much physical effort it is consequently avoided and gradually gets in worse condition, so that when it is required in an emergency, it usually fails to function. Valves of this type are always a source of worry to the waterworks superintendent.

Shut-offs take considerable time and in the event of a break much damage may be done by an uninterrupted flow. To be able to close a pair of 36 or 48 in. gate valves, in say 10 or 12 minutes, with only one operating man, would at least save a bad wash-out and considerable property damage.

Standpipe valves, to operate from a remote point, are also of importance, as by certain operation high pressure may be pumped directly into the mains. Pump discharge valves are very frequently electrically operated, allowing different pumps to be put into service very quickly.

With electrically operated pumps of the centrifugal type, the failure of the check to close, when the pump is shut down, would probably cause considerable damage, and by applying electrical operation to the discharge valve next to the check the pump and motor may be afforded additional protection.

Danger of Flooding.

Breaking of mains is undoubtedly the most important consideration for electrically operated valves and by choosing a combination system of electric control for the most important valve and a portable automobile type of control for outlying districts and smaller valves, a shut-off may be effectively made.

We have certain extremely congested business centers in our large cities that would suffer untold loss and inconvenience if badly flooded. Public buildings, such as art museums and libraries, housing some of the most valuable works of art in the world, would be seriously threatened if large volumes of water were to get at their foundations. Underground railways usually suffer most from this kind of flood, as they are below the street level and while the third rail is submerged, the system is out of commission.

These and hundreds of other reasons for flood protection should receive serious consideration from municipal authorities. Strange to say, however, they admit the seriousness of the situation and yet do not seem to make much of an effort towards finding a remedy. One reason, perhaps, is the lack of information on power operating devices for attachment to existing valves, and then again the valve manufacturers have never actively pushed any form of mechanically operated valve.

The superintendent is thus left to his own resources and knowing the conditions under which such valves are expected to operate, perhaps does not believe that there is anything available to do the work.

A few well-placed electrically operated control valves would afford, no doubt, ample protection to a congested district. But, of course, the number would have to be limited

on account of the expense. Since I have never yet found any water works man to argue against power operation of valves but on the contrary readily admit their value, I would like to explain here, why in my opinion, electrical operation is the only system that fulfills all the conditions.

Electric Motors Reliable.

Electricity is now available at practically every point and is the most reliable power known. The electric motor has so advanced in construction and design as to be adaptable to any and every possible use. It can be made water-tight and to work submerged, or in the open, exposed to snow and ice. The apparatus is ruggedly constructed and foolproof and can be placed at remote points.

Conducting cable is now made with a lead and steel covering, suitable for laying in an open trench or being submerged without additional protection. Indication of the position of the valve gate may also be shown at any distant point by the aid of a few wires.

Last, but by no means, least, an electrical unit may be attached to the valve without in any way disturbing it and without shutting off the supplies, which is the most important consideration.

Operation of large gate valves in street vaults usually presents the greatest difficulty, for these reasons:

The valve may be very old and exceedingly hard to operate.

It must be closed under a velocity in the line due to a break.

The control unit must be of such size as to pass through the ordinary man-hole.

The unit must be absolutely water- and damp-proof and stand partial submergence, caused by volumes of water passing through the man-hole covers.

It must be constructed to be left inoperative for long periods but always ready to operate in case of emergency.

It must not be affected by extreme cold, must be self-lubricating and must have a positive stop at both ends of the gate travel to prevent jamming.

Such operating conditions call for an entirely special device and the Dean Control was designed with entire regard for operating under such conditions.

Dean Valve Control.

The Dean System of Valve Control, which is the outcome of these observations, is built on somewhat radical lines with five particular features incorporated, namely:

1. A single unit system
2. Can be attached to existing valves with a minimum of effort and without shutting down the line
3. Is positive in operation and does not depend upon momentum or drift of moving parts to seat
4. Has ample unseating and seating torque
5. The whole unit is enclosed and waterproof.

The system consists of a single unit in which is incorporated the driving motor, reduction gears, and limit trip mechanism. The feet of the unit are provided with four, holding down bolt holes of standard dimensions for a given range of valves. Four standard units cover the complete line of valve sizes in use.

The motor is totally enclosed and waterproof and possesses an extremely high torque. It is connected to a system of combination worm and planetary gearing for the necessary reduction in speed. The motor speed is normally 1600 r.p.m. and the slow speed shaft 40 r.p.m., the gear reduction being 40 to 1.

The motor shaft is coupled to the worm shaft, both running on ball bearings, and the worm wheel is keyed on to a sleeve forming the sun pinion of a planetary gear. The planet pinions revolve on large studs forced into a flange on the slow speed driving shaft and these pinions mesh into the internal gear forming the outer member of the planetary.

The system is built for either alternating or direct current for voltages up to 220. pressures beyond this being unsafe.

*Paper read at American Water Works Convention, Cleveland.

LOCAL MINERAL AGGREGATE IN BITUMINOUS MACADAM ROADS*

Practically Any Clean Stone or Gravel Can be Used for Aggregate—Many Surface Failures Due to Poor Subgrades or Improper Mixing

By Major W. A. Welch

Chief Engineer, Palisades Interstate Park Commission.

PROPER use of local mineral aggregate in bituminous road construction means great economy in these days of high transportation and labor costs. It is possible to build good bituminous macadam road surfaces with practically any stone or coarse gravel found in the United States, provided this aggregate is free from loam, dust or silt when used.

The bituminous mixture is, at best, a wearing surface like the rails of a railroad, and it must be thoroughly and properly supported by the subgrade or it will fail. The subgrade is the real road, it must be properly placed, thoroughly drained, well settled and compacted and, on such a subgrade, a bituminous surface can be laid successfully with a mineral aggregate of comparatively low crushing strength, except on trunk roads. It is, of course, very necessary to thoroughly bond this aggregate and keep it free from moisture, dirt or dust, for these are, in my opinion, the greatest enemies of proper bonding.

Compares Highways With Railways

A railway engineer establishes the size and weight of his rails in accordance with the weight and speed of his traffic. On main trunk lines, these rails are made heavy enough to carry the heavy fast traffic, in spite of minor defects in the subgrade, but on the branch lines and feeders these rails are lighter for the sake of economy. Experience has taught these things and many others to the railway builders, and the highway engineer should profit by these years of experience and experiment, for our highways have become very like our railways. Your main trunk lines should have wearing surfaces which will carry any traffic and any speed, without failure, in spite of minor defects in the subgrade, but such surfaces are not necessary on minor roads and it is not economy to build them.

The safe crushing strength of trap rock or basalt averages approximately 350 tons per sq. ft.; granites, 350 tons per sq. ft.; limestones and marbles, 300 tons per sq. ft.; sandstones 215 tons per sq. ft.; good air-cooled slag, 300 tons per sq. ft. and ordinary chalk, 15 tons per sq. ft.

Practically all the stone in the United States comes within these limits and all of it, save the chalk and very soft sandstones, will make good bituminous macadam road surfaces. Specifications must vary with the types, the softer aggregates must be used in larger sizes, greater care exercised with them to keep out the dust and the rolling must be governed by the type of aggregate. The harder stone can be thoroughly compacted by heavy rollers and still be penetrated and thoroughly bonded by the asphalt or tar, but the softer stones, when used in penetration work, must not be rolled as hard or they will not allow the binder to properly fill the voids, and care must be taken to keep the aggregate even, as many quarries have seams or stratas of soft shaley stone, which, if put in with the better material, will cause trouble. More care must be taken with the top course or seal coat when the softer aggregates are used to insure a thorough coating on the actual wearing surface.

Causes Subgrade Failures

There is little accurate data obtainable on this subject, few experimental sections of such surfaces have been laid and watched. Of all the failures of bituminous macadam surfaces, which have come to my notice, none have been due in any way to the character of the mineral aggregate. By far, the greater number of these failures are due

to bad subgrade and the others to poor workmanship, dirt and dust in the aggregate or poor binding, due to improper rolling and penetration.

Many of these failures are due to frost action in the subgrade, or improper drainage, which permits this frost to heave up the surface, or the gradual accumulation of moisture in poorly drained places in the subgrade, which destroys the support of the wearing surface through no fault of that surface.

Other failures were plainly due to improper mixing or penetration, from careless workmanship; others to the careless use of dirty aggregate, so full of loam, silt or dust that the binder was not able to reach the stone, or the aggregate was badly graded; and some other failures are entirely due to bad or improperly heated binder. One sheet asphalt failure was due to the use of glacial silt, ground as fine as cement as the only aggregate.

I know the one piece of penetration surface, in which three experimental sections were laid, each of about 500 ft. In these sections were used trap rock or very hard basalt, limestone, just as average grade and sandstone of good character, while on all the rest of the road, granite of good grade was used. This surface was laid in three layers of 2 in., 2 in. and 1 in. Two years after opening, a seal coat was put on and nothing has been done with it in the past six years. The same materials were used on the seal coat and I can distinguish no difference at all in these four sections of pavement. This road has carried up to 400,000 cars and trucks per season of eight months and the pavement is in perfect condition; but, it is laid on a perfect subgrade and 18 in. of Telford.

Between the entrance to a ferry slip and the foot of a hill 1½ miles long, brick paved, on concrete base, with grades from 5% to 8%, there is a rock fill 300 feet long. As this fill was expected to settle, it was decided to lay a temporary cinder surface on it. Three inches of clean steam cinders were spread and rolled with a 1000 lb. roller and one gallon per yard of bituminous binder was applied and lightly covered with cinders. Two years later, another application of ½ gallon per yard of binder was made and lightly covered with cinders and at the end of another two years, this 300 ft. of temporary surface is in perfect condition and more than 330,000 cars and trucks used it during the last eight months, and yet, the crushing strength of cinders is not great.

In eastern Ohio and Western Pennsylvania, much slag has been used and when treated about like limestone, has made good surfaces. Many surfaces have been laid with crushed gravel, which is, of course, just like good crushed stone, if properly screened and washed before crushing. The usual specification for this aggregate being 60% more, of material to have angular fragments. But, some surfaces have been laid with gravel without crushing and when this aggregate was clean, properly sized and bonded, these surfaces have been good. In Massachusetts, and other New England States, this uncrushed gravel aggregate has been extensively used, in the so-called tar concrete pavements, with success when the workmanship was good, and many old gravel roads have been successfully surfaced with only gravel aggregate. Good workmanship means more in bituminous macadam surfaces than mineral aggregate does.

It would seem much wiser for the engineer to carefully study all available local mineral aggregate and prepare his specifications to permit the greatest possible use of it in his surfaces, than to fall into the easier method of copying standard specifications and so compelling contractors to import these aggregates and so greatly increase costs. Better put this extra money in your subgrade work, for that is really your road.

The Carmichael Waterproofing Co. of Toronto has been awarded the contract for the roofing and sheet metal work for the new Mount Royal Hotel, Montreal. This firm has completed similar contracts to numerous large buildings in Canada from coast to coast. A built-up Barrett Specification bonded roof 70,000 sq. ft. in area will be installed on this hotel.

GOVERNMENT OWNED AND CONTROLLED COMPARED WITH PRIVATELY OWNED AND REGULATED PUBLIC UTILITIES IN CANADA AND THE UNITED STATES—Report made to the National Electric Light Association by William S. Murray, of Murray & Flood, Consulting Engineers. Paper; 8 by 11 in.; pp. 223; profusely illustrated.

Mr. Murray, who was in charge of the super-power survey for the United States Government on the Atlantic seaboard between Boston and Washington was retained by the National Electric Light Association to report on the operations of government owned public utilities with special reference to the Hydro-Electric Power Commission of Ontario. The results communicated in this elaborately gotten up report are hostile to government operation.

PRELIMINARY TOPIC OUTLINE OF THE ECONOMICS OF HIGHWAY TRANSPORT—By Lewis F. McIntyre, Assistant Professor of Civil Engineering, University of Pittsburgh. Paper; 6 by 9 in.; pp. 59.

This Bulletin forms a part of a topical outline in the economics of highway transport and is issued by the Highway Transport Education Committee of the Society for the Promotion of Engineering Education as a part of their work in furthering highway transport education. It is hoped that it may assist engineering students in forming a more definite idea of the field of highway transport and aid them in getting a vision of the opportunities for future employment in this field. It is also hoped that in those colleges where courses in highway transport are being given, or are contemplated, it may assist teachers in this subject in the formation of adequate courses with a minimum of duplicated effort on their part.

TRANSACTIONS AND YEAR BOOK OF THE UNIVERSITY OF TORONTO ENGINEERING SOCIETY—Published by the Society. Paper; 6 by 9 in.; pp. 166; Illustrated.

This is the second number of the revived Transactions of the University of Toronto Engineering Society following the suspension of the monthly journal "Applied Science" published for several years prior to and during the war. This volume which is dedicated to the School of Science men who gave their lives in the great war, contains a dozen or more papers presented to the Engineering Society and its constituent clubs, or specially contributed to the Transactions.

The papers comprise the following: Provincial Highways, by George Hegarth, Chief Engineer of Highways, Department of Public Works of Ontario; Engineering and Trade Within the Empire, by Brig.-Gen. C. H. Mitchell, Dean of the Faculty of Applied Science and Engineering, University of Toronto; The Engineering Institute of Canada, by George T. Clark, Designing Engineer, Toronto Harbor Commission and past chairman of the Toronto Branch of the Engineering Institute of Canada; Organization, by Professor E. A. Allent; American Architecture, by John M. Lyle; Artistic Design of Bridges, by Charles Fowler, Chief Engineer of the Detroit-Windsor Bridge; The School of Engineering Research, by Professor M. C. Boswell; Special Water Power Lectures, a review by Professor R. W. Angus; Some Principles Controlling the Use and Design of Hydraulic Turbines, by Lewis F. Moody, Philadelphia; Essay on Fire Prevention, by T. S. Glover, Class of 1922; The Canadian Institute of Chemistry, by Professor J. Watson Bain; Stress Analysis, by Professor T. R. Loudon.

In addition to the technical papers there is a great deal of information concerning the operation of the clubs and societies connected with the Faculty of Applied Science and Engineering.

MECHANICAL ENGINEERS MEET IN ATLANTA

ATLANTA, Ga., will be the convention city of the American Society of Mechanical Engineers, who will hold the 1922 annual Spring meeting in the South, May 8-11, inclusive. Three days will be given over to technical sessions and visits will be paid to various points of interest in the district, such as the University of Virginia, textile mills at Greenville, S.C., steel mills at Birmingham, Ala., and Muscle Shoals. The program of papers to be presented includes a variety of subjects of interest to members, such as textile machinery, material handling equipment, fuel wastes, boiler tests, water power development, steam engine efficiency, centrifugal castings, welding, etc. The headquarters of the convention will be at the Piedmont Hotel.

Letter to the Editor

CLAIMS TO BE VALID MUST BE PROVED.

Sir—The article entitled "Developments in Photographic Surveying" by M. P. Bridgland, which appeared in the "Canadian Engineer" April 4, 1922, may possibly be of some interest to photographers, but the system described cannot be applied to topographical surveying in a practical way unless by eliminating the two main objectives of such surveys—efficiency and economy. The foremost reason for stating this goes beyond mere discussion or individual preference and is found in the many years of continual test and observation which have shown the impracticability of photographic "surveying." The "Engineering News-Record" in an editorial in the issue of April 6, 1922, tells us that engineers are the principal map-using class and they are the people most directly concerned in the matter of how our maps are made. If this is true then engineers are in the best position to judge of map requirements—and not photographers.

The most important part in Mr. Bridgland's paper to which I desire to direct the attention of your readers is where reference is made to the superiority of the camera method as compared with the plane table. Professor Anderson, in a previous article on the same subject, arrives at the same conclusion. The former sums up with the following statement:

"The precision is that of a good plane table survey but with the advantage that many more points are plotted and the contouring is done by the surveyor in the office, with views of different stations continually before him, while with a plane table this comparison is entirely wanting."

The article by Professor G. R. Anderson was published in the "Canadian Engineer" under the title "Stereographic Measurement," as long ago as March 28, 1912. His concluding remarks were as follows:

"The great simplicity of this method as compared to that of plotting by means of the plane table will be at once apparent, and the precision secured is much superior and comparable to that of any other method of survey in ordinary country."

These two gentlemen presumably hold responsible positions and documents signed by them and published in an engineering journal will naturally be accepted as authentic and reliable. I have good reasons, however, for questioning the above two statements, and would respectfully ask Mr. Bridgland and Professor Anderson if they are prepared to support them by a practical test in the field? If they have sufficient confidence in their instrument to prove by actual demonstration its superiority to the plane table? I will even encourage them to the extent of entering the contest without a fully equipped plane table merely using a military traverse instrument minus telescopic alidade and stadia. There are no insuperable difficulties to arranging such a trial; both instruments could be given a fair chance under engineering supervision and an impartial judgment arrived at without endless discussion.

CHLORINATION, TASTES AND ODORS

IN OUR issue of last week there was included the tentative program of the 42nd annual convention of the American Water Works Association. The question of tastes and odors in water supplies has been regarded as of such importance that a symposium has been prepared. Several technical papers will be presented at the meeting and leading sanitarians of the day are expected to take part in the discussion.

One of the chief questions that sanitarians are called upon to investigate is the occurrence of taste and odor in water. Taste resulting from excessive algae growths are not common in this country, because storage and impounding reservoirs are not extensively used; and the waters of the Great Lakes, on account of the continuously moving currents, do not favor the growth of these organisms in sufficient numbers as to cause taste. The chief problem, which at times is a very real one, is the taste in water following the application of chlorine for sterilization purposes. The cause of this is not definitely known, but recent researches have indicated that it is the result of the formation of chemical compounds designated as chloro-phenols. The discharge of industrial effluents containing phenols into rivers and streams from which municipal water supplies are drawn, is held to be largely responsible for this. Assuming that this is the cause, legislation should be framed to prevent such indiscriminate discharge of effluents into city sewerage systems. It is likely that many industrial plants could recover by-products from their trade wastes which would not only compensate them for labor and expense involved, but might actually be instrumental in preventing taste in water treated with chlorine.

In the last report of the Milwaukee Sewage Commission, the question of the relationship of phenols and chlorine to taste was given considerable space. It was demonstrated at Milwaukee that a combination of these two chemicals produced a water practically undrinkable, and after an exhaustive survey had been completed, it was found that the effluents from the gas and coke plants in the city contained phenols in large quantities, and that under certain meteorological conditions the river waters containing these wastes mixed with the lake water and ultimately caused objectionable taste in the city supply. By diverting the flow of the effluents, taste was completely removed.

No figures appear to be available as to what amounts of phenol and chlorine are necessary to produce taste, and it would appear to offer considerable scope to research chemists, particularly on water works plants. It is interesting to recall that in dealing with the New York supply, Brush recently found that tastes and odors were overcome by the use of excess chlorine as advocated by Houston in England. In New York, where taste occurred following the presence of algae in the reservoirs, the chlorine dose was raised from 0.3 to 0.7 parts and taste practically eliminated.

It may be found that when taste occurs from chloro-phenols, there are definite quantities of each reagent which combine and cause taste, and that a decrease or increase of chlorine may be the solution. In England, Houston definitely recommended super-chlorination, followed by de-chlorination of the excess chlorine with neutralizing reagents as a solution to taste problems. It is safe to state that with so many of our leading chemists working on this interesting problem, the solution will ultimately be forthcoming and a further advance made in the field of sanitary science.

RAILWAY ELECTRIFICATION DISCUSSED AT OTTAWA

ELECTRIFICATION of railways as an issue to be faced in the near future in this country was brought vividly to the attention of the House of Commons recently by Mr. Deslauriers, member for St. Mary's. In addition to pointing out the magnificent electrical resources of this country and their bearing on the solution of the fuel problem, Mr. Deslauriers called the attention of the House, and of the country generally to the fact that there is an annual fire loss in forests of from ten to fifteen million dollars arising from forest fires many of which are kindled by sparks from locomotives. Such losses, said the speaker, might be completely abolished under electric operation.

Mr. Deslauriers made the assertion that for an identical trip under the same load occupying the same time, the cost of the motive power for an electric locomotive is as 88 to 200 compared with that for a steam locomotive and that the maintenance costs are as 8 to 18. He wished to know why the railways in the valley of the St. Maurice having 800,000 h.p. available should not be electrified. In view of his understanding that the Canadian Pacific Railway a couple of years ago almost concluded a contract with the Shawinigan Water & Power Co. for the electrification of its Montreal to Quebec line, he asked why the lines in the neighborhood of Montreal had not been converted to electric operation.

The declaration of Hon. W. C. Kennedy, Minister of Railways, in concluding the debate, to the effect that the Board of Management of the National Railways is keenly alive to the situation is of interest. The Board feels, however, that in Canada the change at the present time would entail a very large expenditure, which the result of investigations so far made would scarcely warrant. It thus appears that those in charge of the National Railways are entirely sympathetic, and that, when the right time comes, they will do their part.

In view of the economic condition of the country and the large capital expenditure involved in electrification, amounting to from forty to fifty thousand dollars a mile, the attitude of the government and of the directing heads of the National Railways is none other than sound. For some years the Canadian Pacific Railway has been consid-

ering the question of electrification, but so far has not discovered any one section of its line on which electrification might profitably be made. In this finding we have, therefore, corroboration of the views of the Board of Management of the National Railways.

WINNIPEG AQUEDUCT UNDERDRAINAGE

AT A recent meeting of the city council of St. Boniface, Man., there was some discussion of the effect of alkali on certain portions of some of the sewers in that city. Some members of the council expressed an opinion that the damage was due to poor workmanship rather than to any other cause. The city engineer and one of the aldermen, in order to combat this statement, referred to the fact that the Shoal Lake aqueduct of the Greater Winnipeg Water District, one of the best examples of concrete construction in Canada, had suffered from alkali action.

A reporter who was present at the meeting and who apparently was poorly informed regarding the history and extent of the Winnipeg aqueduct alkali troubles, wrote an article intimating that alkali is destroying the entire aqueduct and this article was reprinted by numerous daily newspapers throughout the country, with the result that many engineers who know the history of Winnipeg's past alkali troubles received the impression that fresh and more serious difficulties had been encountered. This is incorrect, and the engineers in charge of the District's affairs have reason to believe that the type of underdrainage constructed last year has proven effective in preventing alkali-bearing groundwaters coming into contact with the concrete.

It is possible that additional drainage may be required this year or next, depending upon further observations that will be made within the next few weeks, but if the commissioners in charge have to undertake this additional drainage, it can be considered as nothing more than the logical step that they should take to protect the structure.

PERSONALS

ALEX. KOIVU has been appointed road commissioner for McIntyre Township.

J. J. C. BRADFIELD, chief engineer of the proposed bridge over Sidney Harbor, Australia, is visiting Canada on route to England. Mr. Bradfield will visit Ottawa for the purpose of interviewing representatives of Canadian firms who may wish to bid on the work. Tenders for the construction of the bridge will be received until October 31, 1922.

J. B. IELME of Smith's Falls, Ont., who graduates this year in architecture from the Faculty of Applied Science, Toronto University, has been awarded a Provincial Scholarship in town planning by the Department of Education. The award which is tenable for one year, provides for travel and study in France on the subject of Town and Regional Planning and Housing.

H. P. BORDEN has opened an office in the Hoppe Chambers, Ottawa, as a consulting engineer, specializing in bridges and structures in steel and reinforced concrete. Mr. Borden graduated from McGill in 1902 with the degree of B.Sc., his first position after leaving college being in the Bridge Department of the C.P.R. He was later assistant chief engineer of the Locomotive & Machine Co., Montreal, and architectural engineer for the C.P.R. In 1908 he joined the staff of the Board of Engineers, Quebec Bridge, as assistant engineer and secretary, and was later appointed assistant to the chief engineer. On the death of C. C. Schneider in 1916, Mr. Borden was appointed to fill the vacancy on the Board of Engineers, which position he held until the completion of this work in 1918. From 1919 to 1921 he was engaged by the Dominion Government in a consulting capacity.

HON. DR. JAMES H. KING, the new Minister of Public Works in the Dominion Government is a doctor by

profession, practicing at Cranbrook, B.C. The new minister who was born at Chipman, N.B. on January 18, 1873.

was educated at St. Martins Academy, and graduated from McGill University, Montreal. Dr. King first began practicing at Andover and St. John, N.B., but after three years he left the Maritime Provinces and went West to Cranbrook, B.C., where he has resided ever since. Dr. King began his political career in 1903 when he was elected to represent Cranbrook in the Provincial Legislature. He represented this constituency until 1907. He was liberal candidate for Kootenay at the general elections in 1911, but was defeated, however, in September 14, 1916, he was again returned to the Provincial Legislature and accepted the portfolio of Public Works in the government formed in November 29, 1916. The appointment was confirmed in December, 1916, when he was re-elected member for Cranbrook. At the general election last December Dr. King was elected member of Dominion Parliament and last February was appointed Minister of Public Works. He has always taken a deep interest in educational affairs and is one of the founders and governors of the American College of Surgeons, Chicago.

He has always taken a deep interest in educational affairs and is one of the founders and governors of the American College of Surgeons, Chicago.

POWER SITUATION ALONG THE T. & N. O. Ry.

COMMISSIONERS of the Temiskaming and Northern Ontario Railway are taking every precaution to retain control of the necessary rights to assure the full amount of energy that may be required at some future date in connection with the electrification of their road, but they have no desire to stand in the way of the Hollinger Consolidated Gold Mines of Porcupine being given rights to develop whatever additional hydro-electric energy which may be required by that company.

It is stated there is more energy running to waste at the present moment on the Abitibi River than will ever be required by all three concerns now involved, namely: the T. & N. O. Railway, the Hollinger Consolidated Gold Mines, and the Abitibi Power and Paper Co.

In the meantime, the Northern Canada Power Co. is rushing work in connection with developing an additional 7,000 h.p. on the Matagami River, with which to supply the mines of the Porcupine. If this will meet the full requirements of the Porcupine field, it may not be necessary for the Hollinger to engage in power developments on its own account.

Thomas Adams, town-planning expert for the Dominion Government, is in London, Ont., drawing up a city plan. Mr. Adams, in conjunction with city engineer H. A. Brazier, will make a general survey of the city in connection with the proposed zones.

The Canadian Bridge Co., contractors for the steel highway portion of the Johnson Street bridge superstructure, will shortly commence the erection in Victoria of one of the largest steel cranes ever placed in operation on the Pacific Coast. The crane has a 90-ft. boom and a sweep of 180 ft.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand or proposed, contracts awarded, changes in staffs, etc.

TENDERS PENDING

The following tabulation is presented as a reminder to contractors in regard to tenders that are still pending, other than those reported in this issue. The word "Issue" refers to the issue of "Canadian Engineer" in which there appeared a notice giving details regarding the call for tenders.

Place of Work	Tenders Close	Issue
Queenston Heights, Ont., sub-grading and construction of macadam road-way	May 24	Apr. 18
Bridgewater, N.S., erection of Fire Hall	May 8	Apr. 18
Pembroke, Ont., erection of hospital ..	May 9	Apr. 11
Ontario, Province of, various work on Provincial highways	May 11	Apr. 11
Toronto, Ont., work on Riverdale Branch Technical School	May 3	Apr. 18
Crystal Beach, Ont., sewer and disposal plant	May 5	Apr. 18
Toronto, Ont., construction of Gerrard St. bridge	May 16	Apr. 18
Francis, Sask., road work	May 5	Apr. 25
Chatham, Ont., supply and construction of steel sheet piling baffling system in water works sedimentation basin	May 10	Apr. 25
Montreal, Que., erection of Notre Dame Hospital	May 15	Apr. 23
Ford City, Ont., erection of school	May 10	Apr. 25
Lachine, Que., supply of stone, sand, cement, clay pipe, bitumen and paving of 18th Ave.	May 4	Apr. 25
Newmarket, Ont., erection of arena building	May 10	Apr. 25
P. E. I., Province of, grading and concrete structures	May 19	Apr. 25
Quebec, Province of, road construction	May 12	Apr. 25
Winnipeg, Man., three 1000 k.v.a. transformers	May 15	Apr. 25
York Tp., Ont., concrete culverts	May 13	Apr. 25
York Tp., concrete sidewalk and grading	May 6	Apr. 25

BRIDGES, ROADS AND STREETS

Berthier, Que.—Tenders for the construction of the Ralston bridge in steel and concrete, will be received at the office of J. A. A. Lavallee, Sec.-Treas., Berthier, until 12 o'clock noon, Wednesday, May 3. Plans and specifications at office of secretary-treasurer.

Bonaventure, Que.—Town Council considering the travelling of roads.

British Columbia, Province of.—Tenders for construction of approximately nine miles of the Ymir Road South of Nelson, will be received until noon, Wednesday, May 3, by Hon. W. H. Sutherland, Minister of Public Works.

British Columbia, Province of.—Tenders for new formation and paving of the Trans-Provincial Highway, Chilliwack district (2,074 miles), will be received at the office of Hon. W. H. Sutherland, Minister of Public Works, until noon, May 9. Plans and specifications may be seen at the office of P. Philip, Public Works Engineer, Department of Public Works, Victoria, and at the District Engineer's office, Court House, New Westminster.

Chatham, Ont.—Road construction program of Kent County Council for this year includes 12 miles of pavement to be located near Pain Court, Wallaceburg, Thamesville,

Dresden, and along the Dover-Chatham Townline. All of these pavements will be of permanent concrete. Road Supt., L. A. Pardo, Chatham.

Cobalt, Ont.—Mining interests in this district are taking steps to encourage the Ontario Government to improve the road to the South Lorrain area.

Cornwall, Ont.—Doran Construction Co., of Ottawa, has been awarded contracts for building roads and culverts east and west of Cornwall, and also two bridges in the township of Charlottenburg and north or Elmsley in the vicinity of Perth.

Fredericton, N.B.—Provincial Government will carry on permanent road construction this year between Musquash and Lepreau, between Nerepris and Welsford, and near Buctouche. Repairs to the Rothesay road will be made at an early date.

Halifax, N.S.—Contract awarded by City Council to the Stephen Construction Co., of this city, for the construction of curbing and sidewalks between \$125,000 and \$150,000.

Hamilton, Ont.—City Council plans to pave one side of Main St. City Engineer, E. R. Gray.

Hamilton, Ont.—Capitalized at \$150,000 the Albion Paving and Construction Co., Ltd., has been granted a Dominion charter. The company, incorporated for the purpose of carrying on a general contracting and construction business, has for its incorporators A. M. Spafford, W. H. Latimer, D. Morsman, M. A. Gallagher and A. H. Joyce, all of Toronto. The head office of the company will be in this city.

Kenora, Ont.—Peter Heenan, M.P.P., announced that an effort will be made this summer to grade several miles of the highway west from Keewatin.

Kingsville, Ont.—Contract for labor and materials necessary for the construction of reinforced concrete base and stone filled asphalt, together with necessary excavating curbing, etc., has been awarded to Merlo, Merlo & Ray, Ltd., Ford City, Ont.

Kitchener, B.C.—Plans for road construction in this vicinity are on file at the Provincial Department of Public Works. District Engineer, William Ramsay, Nelson.

Kitchener, Ont.—Tenders will be received by S. Shupe, City Engineer, until 5 p.m., Monday, May 8, for the construction of approximately 10,000 sq. yds. of bituminous penetration pavement, on a crushed stone base. (See official adv.).

Lindsay, Ont.—Tenders closed May 1 for the construction of granolithic sidewalks for the year 1922, said sidewalks to comprise 5,000 lin. ft. or upwards, as authorized. Town Clerk, W. R. Alley.

London, Ont.—Superintendent Charles Forrester, of the Grand Trunk Railway, announced that construction work on the overhead bridge on the north road to Springbank will be started immediately by the company.

Loretteville, Que.—Town Council plans construction of concrete bridge.

Malahide Tp., Ont.—Tenders, addressed to Jas. A. Bell & Son, Civil Engineers, Courthouse, St. Thomas, will be received until noon, Friday, May 5, for grading Silver Creek Hill. Approximate quantity of excavation, 13,000 cu. yds. Plans and specifications may be seen at office of the engineers, or at the office of Frank Pineo, county road superintendent, Courthouse, St. Thomas.

Matsqui, B.C.—Council considering construction of concrete walk on St. Olaf St. Clerk, John Le Feuvre.

Montreal, Que.—The laying of concrete blocks as a temporary sidewalk in the outlying wards of this city has

been recommended to the City Council by the executive committee.

Montreal, Que.—The opening up of St. Joseph Blvd., from Henri Julien Ave. to Papineau Ave., will be considered by City Council, the road to be of asphalt with a concrete base.

Montreal, Que.—The paving program for this year will be ready shortly and it is anticipated to total over a million dollars. \$41,900 has been voted for the paving of Wellington St., from St. Patrick to Congregation Sts.; \$140,000 is available for the completion of the paving of St. Denis St., from Carrieres to Isabeau Sts.; \$70,000 for the paving of Cote des Neiges Road; and \$32,000 on the appropriation made for paving Laurier Ave.

Ontario, Province of.—Construction work will shortly be resumed in the Hamilton district on the provincial highways. Contracts on the Winona-Hamilton road and Brantford highway have already been let.

Ontario, Province of.—Tenders will be received by W. A. McLean, Deputy Minister of Highways, until 12 o'clock noon, Wednesday, May 10, for the supply of 40 and 60 per cent road oil.

Ottawa, Ont.—Ald. McElroy presented a petition to City Council for the paving of Renfrew Ave.

Owen Sound, Ont.—Contract has been awarded by the Provincial Highway Department to W. C. Chambers, of Harrison, for grading the Provincial highway north of Owen Sound to Dornoch, work to start about May 1.

Owen Sound, Ont.—Suburban Area Commission plans construction of a high level bridge at the point on the North Gravel Road where Maxwell's creek crosses, and also the construction of a 9-ft. concrete roadway. Commission also plans to repair other sections of roadway, including the St. Vincent, Sarawak and Leith roads.

Portage la Prairie, Man.—Tenders will be received by D. McGowan, Sec.-Treas., until 2 o'clock, Tuesday, May 2, for hauling materials and building six timber bridges.

Quebec, Province of.—Provincial Government has been asked to construct a bridge over the Saguenay, near Chicoutimi.

Quebec, Province of.—The preliminary plans for the Vaudreuil bridge, one of the Perrot Island bridges, have been fully studied by the engineers, according to Ivan Vallee, chief Engineer, of the Department of Public Works. The Provincial Cabinet will now take up the matter and decide when tenders for the bridge will be called for.

Regina, Sask.—Approximately \$1,570,000 will be spent by the Provincial Government this season on roads and large bridges, according to J. G. Gardiner, Minister of Highways, the expenditure to be apportioned as follows: Roads constructed under the Federal aid scheme, \$900,000; large steel and concrete bridges, \$120,000; main market roads, \$550,000.

St. Hyacinthe, Que.—Council contemplates construction of pavements and sidewalks.

St. Jacques, Que.—Council will call tenders for construction of bridge estimated to cost \$18,500.

St. Thomas, Ont.—Wellington St. is soon to be repaved with asphalt. Hughes St. north will also be paved with asphalt. City Engineer, W. C. Miller.

Sherbrooke, Que.—Ratepayers approved of by-law passed by City Council providing for the borrowing of \$75,000 for the levelling and paving of King St. West, from Montcalm bridge to the city limits. Sec.-Treas., E. C. Gatien.

Sherbrooke, Que.—By-law passed by City Council providing for borrowing of \$55,000 for reconstruction of Dufferin bridge in concrete and steel, has been approved by ratepayers.

Shuniah, Ont.—Municipal Council proposes to expend approximately \$22,000 on road improvement this summer. Road Commissioner, Alex. Kolva.

Stratford, Ont.—The firm of W. L. Malcolm, of Kingston, has been awarded the contract for concrete curb and gutter construction. Prof. Lindsay Malcolm, of Queen's University, will supervise the work.

Sydney, N.S.—City Council may erect a bridge at Argyle St. at cost of \$12,000.

Three Rivers, Que.—An expenditure of \$50,000 on street improvements is planned by the Council.

Tillsonburg, Ont.—Lisgar Ave. will be paved. Clerk, A. E. Raynes.

Toronto, Ont.—Board of Control recommended to City Council the adoption of the Provincial good roads scheme for this district which calls for an expenditure of \$5,000,000, of which the city would have to pay \$1,000,000.

Toronto, Ont.—Following contracts awarded for construction of pavements: Asphalt-Austin Crescent and Austin Terrace, Godson Contracting Co., Ltd., Toronto; Beachview Crescent, Gerrard St. East, George St., Hillingdon Ave. and Fairmount Crescent, Kilmer & Barber, Ltd.; Blackthorn Ave., Godson Contracting Co., Ltd.; Cluny Drive and Dewson St., Constructing & Paving Co., Ltd., Toronto. Bitulithic—Beachview Crescent, Belhaven Road, Brookside Drive, Caithness Ave., Glebeholme Boulevard, Glebeholme Ave., Wrenson Road, Warren Paving Co. of Ontario, Ltd., Toronto; Bowmore Road, Commissioner of Works. Concrete—Briar Hill Ave., Commissioner of Works.

Victoria, B.C.—City Council awarded contract for completion of the Johnson St. bridge to the Canadian Bridge Co., of Walkerville, Ont., for \$213,600.

Waterloo, Ont.—Town Council adopted recommendation of the Board of Works for the laying of pavements on nine streets. Town Engineer, Chas. Moogk.

Whitby, Ont.—There is a strong movement here to go ahead this year with the paving of the two portions of Brock St. now forming part of the Provincial Highway from Whitby to Lindsay, between the Canadian National and Canadian Pacific stations.

Winnipeg, Man.—City Council referred back for further consideration recommendations for the construction of six crossings on Sherbrooke, Maryland, Graham and Rupert Sts.

Woodstock, Ont.—G.T.R. has decided to make extensive improvements this spring to the three bridges which span its tracks. Six-ft. steel bridges are to be added to the Wellington and Bay St. spans, and concrete abutments are to be added to the latter.

Woodstock, Ont.—By-law was introduced at Council meeting providing for the construction of a 4-ft. concrete sidewalk on the south side of Anne St. Tenders will be called for concrete walks, curb and gutters to be constructed this year. Clerk, James C. Haight.

WATER, SEWAGE AND REFUSE

Brockville, Ont.—Town Council intends to construct a sewer on Front Ave., between Park St. and Ormond St., at a cost of \$2,400. Town Clerk, Geo. K. Dewey.

Chatham, Ont.—Board of Water Commissioners are receiving tenders until May 10 for the steel sheet piling in connection with the baffling system at the sedimentation basin of the water works.

Goderich, Ont.—At the instance of the Provincial Board of Health a formal order has been served on the civic authorities demanding the improvement of the town's water supply system.

Guelph, Ont.—Plans for the proposed new trunk sewer from Gordon St. to the disposal works have nearly been completed by City Engineer F. McArthur.

Halifax, N.S.—City Works Committee on April 22 received and opened ten tenders for the laying of a new water main from the corner of Quinpool Road and Robie St. in and down Cogswell St. to Brunswick. Tenders were referred to City Engineer Doane.

Hamilton, Ont.—City Council intends to construct pipe sewer on King William St. at cost of \$1,460. City Engineer, E. R. Gray.

Hamilton, Ont.—The superintendent of the water commission has been instructed to secure estimates on the cost of extending the intake pipe at the lake 150 ft.

Hamilton, Ont.—Tenders will be received by S. H. Kent, City Clerk, until 5 o'clock p.m., Monday, May 22, for the construction of Section No. 4, Western Storm Overflow Sewer. (See official adv.)

Kamloops, B.C.—Contract for construction of east end sewer awarded to the Kamloops Plumbing & Heating Co. the contract price being \$47,980. Following tenders were also received: Vickers Contracting Co., Ltd., \$98,600; Cotton Co., Ltd., \$72,000; Broley & Martin, \$48,287; A. D. Creer, \$68,040; Nick Cosco, \$56,900; Robertson & Rendell, \$59,149; G. K. Williams and J. W. Bye, \$51,457; Dominion Construction Co., Ltd., \$89,964; Nickson Construction Co., Ltd., \$68,50; G. Woodward, \$63,450; G. C. Hopper, \$56,873.

Ladner, B.C.—Contract for supply of pipe for the Westham water supply awarded to Clement and Lambert by Council.

Midland, Ont.—Following is a list of the tenders received for construction of sewers on William and other streets: J. Toole & Son (catch basins not included), vitrified pipe, \$67,000; P. Molran, London, concrete, \$53,185.37, vitrified, \$56,125.58; Ruscie Bros., Toronto, vitrified, \$53,981; Bath & Anderson, concrete, \$51,174.72, vitrified, \$53,674.72; Bumbaca Bros., concrete, \$48,392.75, vitrified, \$49,392.75; Trew Bros., concrete, \$44,237.70, vitrified, \$46,737.70; Curran, Briggs Co., Toronto, concrete, \$43,645.50, vitrified, \$46,418.12; Town of Midland, concrete, \$43,558, vitrified, \$45,850.36; F. F. Fry, Toronto, concrete, \$39,214, vitrified, \$41,714.32.

Montreal, Que.—Contract for the construction of sewers on Park extension awarded to Fillon & Brothers, at approximately \$100,000.

Montreal, Que.—A proposal to spend \$4,000,000 on the construction of a huge main sewer, that would serve the whole of the northern section of the city will come before the Council on a motion prepared by Ald. Bray.

Montreal, Que.—City Council has approved construction of following sewers: Lanoraie St., from Cremazie Road to Abraham St., \$19,842.50; Birman St., from Cremazie to Beaumont, \$29,381.52; Ball St., from O'Shaughnessy St. to Stuart St., \$1,785.25; from O'Shaughnessy to St. Adele St., \$796.50; and from St. Adele to Bickerdike, \$776.25. Another street from St. Adele to Lanoraie St., \$1,950; and Hopper St., from Birman St. to Allen St., \$783.50.

North Bay, Ont.—Board of Works recommended construction of storm sewer on McPhail St., Whitson St., from Rock to McIntyre St., and from Rock east of Metcalf St., along McIntyre St. to T. & N. O. Railway. Clerk, Wm. N. Snyder.

Ottawa, Ont.—An immediate start is to be made on the excavation work of the addition to the Lemieux Island water supply pipe.

Quebec, Que.—Waterworks Committee awarded contracts for supplies amounting to \$50,000, including following: Valves, Drummond, McCall & Co., Ltd., at \$9.85, \$16.85 and \$28; cast iron pipe, Canada Iron Foundries, 4-in., \$54.50, 6, 8 and 12-in., \$50; lead pipe, Mechanics Supply Co.; pig lead, Crane, Ltd.; clay pipe, Standard Clay Products; cast iron, Terreau & Racine.

St. Raphael, Que.—Council plans construction of an aqueduct at a cost of \$12,000.

Saanich, B.C.—Municipal Council plans to submit sewer by-law to ratepayers about the middle of July. Clerk, H. S. Cowper.

Sherbrooke, Que.—Ratepayers approved of by-law passed by City Council providing for borrowing of \$115,000 for the construction and laying of sewers. Sec. Treas., E. C. Gatién.

Toronto, Ont.—Construction of sewer in Richard Ave. is proposed.

Toronto, Ont.—Contract awarded to A. Cavotti, Toronto, for laying and jointing of 6-in. water pipes in Nursewood Road.

Toronto, Ont.—Contract for construction of sewer in Strathmore Boulevard, from Woodington Ave. to Glebe-mount Ave., awarded to W. E. Taylor, at \$2,387.

Toronto, Ont.—Works Commissioner Harris recommended the laying of water mains on Bellefair Ave., St. Clair Ave. east of Hudson Ave., Edna Ave., Morton road, Bingham Ave., Davenport road, east of Greenlaw, Regal road, east of Oakwood Armadale Ave., and Wolverleigh Boulevard.

Toronto, Ont.—Tenders will be received, addressed to C. Alfred Maguire (Mayor), Chairman, Board of Control, City Hall, until 12 o'clock noon, Tuesday, May 16, for one four-million Imperial gallon centrifugal pump. Specifications may be obtained at the Works Department, Room 12, City Hall.

Toronto, Ont.—Tenders will be received, addressed to C. A. Maguire (Mayor), Chairman, Board of Works, until noon, Tuesday, May 9, for the laying and jointing of 6-in. water pipes in the following streets: Claude Ave., Elmer Ave., Garfield Ave., Glendale Ave., Haslett Ave., Merrick Ave., Patterson Ave., Rhyt Ave., St. Germain Ave., Simpson Ave., Mount Pleasant Road, Lighthouse Ave. and Ingham Ave. Specifications may be obtained at Room No. 320, City Hall.

Toronto, Ont.—Tenders will be received, addressed to C. A. Maguire (Mayor), Chairman, Board of Control, until noon, Tuesday, May 9, for the construction of the following sewers: Western Harbor Development Drainage System—Section 1—2000 ft. east of Parkdale Drive to 1,478 ft. farther east; Section 2—Parkdale Drive to Jane St., Section 3—Parkdale Drive to Jane St.; Margueretta St., from College St. to Bloor St.; Ardagh St., Durie St. to Jane St. Specifications may be seen at the Works Department, Room 6, City Hall.

Vancouver, B.C.—Plans for a storm sewer, running along the Collingwood Valley from Earls road to Aberdeen St., in South Vancouver, were approved by the Vancouver and Districts Joint Sewerage and Drainage Board. The board's engineer was instructed to make an estimate of the cost.

Waterloo, Ont.—Water and Light Commission will be asked to extend the water main on Rathbourne Ave., from Arthur St. to Blandford St.

West St. Paul R.M., Man.—Tenders will be received by H. I. Thompson, Sec. Treas., Middlechurch, Man., until May 10 for drilling two wells on Rossmore Ave.

Winnipeg, Man.—City Council authorized construction of sewer in Balfour St.

Winnipeg, Man.—City Council authorized water main construction aggregating approximately \$36,000. City Engineer, W. P. Brereton.

York Tp., Ont.—Following contracts awarded for construction of 6-in. water mains: Bickness Ave., Peter Mohan; Dunvegan Road, A. Cavotti; Russell Hill Road, A. Cavotti; Forest Hill Road, A. Cavotti; Lacey Ave., W. E. Taylor; Schell Ave., A. Cavotti; Burgess Ave., Peter Mohan; Nealon Ave., Peter Mohan; Logan Ave., Peter Mohan; Don Mills Road, Gordon Thompson; Leroy Ave., Peter Mohan.

LIGHT, HEAT AND POWER

Cloverdale, B.C.—Plans are being prepared by Municipal Engineer J. O'Hara for a street lighting system.

Donnacona, Que.—The construction of a storage dam is planned by the Donnacona Paper Co.

Edmonton, Alta.—Tenders addressed to the city commissioners will be received until 1 p.m., Monday, May 15, for the supply of two automatic induction feeder voltage regulators, 2,300 volts; two 2,000 k.v.a. 13,200-6600-2200 three phase, 60 cycle, w.c. transformers. Specifications may be obtained at the office of the Superintendent of the Electric Light Department, Second Floor, Civic Block.

Halifax, N.S.—Following tenders were opened by the Civic Works Committee for installation and supplies for the new street lighting service, some of the tenders being for complete installation and others for partial installation and fixtures, etc.; Northern Electric Co., Ltd. (a) \$85,750.72, (b) \$72,344.06, (c) \$75,354.06, (d) \$82,700.13; W. W. Hoyt, \$112,054; Canadian General Electric Co.,

\$48,050; Farquhar Bros. \$56,875 (no wire included); Jas. Graham, Windsor Foundry Co. and F. S. Coombes, detailed prices on standards, etc. Tenders were referred to City Engineer Doane.

Niagara Falls, Ont.—Hydro-Electric Power Commission of Ontario awarded contract for construction of intake and ship channel in connection with the Chippawa-Queenston power development to Tomlinson, Macaw & Macdonald, of Winnipeg. The price is in the neighborhood of half a million dollars. There were 12 tenders submitted.

Ottawa, Ont.—Tenders will be received by the Ottawa Hydro-Electric Commission until 12 o'clock noon, May 12, on the following material: Approximately 46,354 ft. of fibre conduit, 7,400 lbs. of "T" beams and 27,310 lbs. of cast iron manhole covers. Specifications may be seen at the Construction office of the Commission, 75 Laurier Ave. West.

St. John, N.B.—Contract for erection of a transmission line for the distributing of power to the city has been let by N. B. Hydro Commission to the Canadian Bridge Co., Ltd., Walkerville, Ont., who will build the foundations for the towers, fabricate and erect the towers and stretch the cables. The location survey of the proposed line to Moncton has been completed. A test for rock bottom has been commenced at Sherwood Lake, West Branch of the Musquash, preparatory to the construction of an important storage dam in that area.

Vancouver, B.C.—A proposal to construct and operate a central steam heating plant capable of supplying steam heat and power to buildings in this city has been received by the city clerk from the contracting firm of Adkinson and Dill. Permission to lay conducting mains through the city on the same basis as granted similar concerns in Portland and Tacoma is also asked by this firm. The matter will be brought before the City Council.

Winnipeg, Man.—Contract for construction of an addition to the McPhillips St. sub-station of the Hydro-Electric system awarded by City Council to Foster & Henson, at \$6,859.

RAILWAYS

Earnestown, Ont.—Grand Trunk Railway plans to have new steel laid in this vicinity.

Hamilton, Ont.—Plans for the Ottawa St. incline railway provide for a feeder line—a single-track trolley line from King St. to the foot of the incline railway. Application for a charter is now before the bills committee of the Legislature.

London, Ont.—Approximately 400 extra men will be employed in the London division of the Grand Trunk Railway this summer laying new steel rail and rebalasting the right-of-way. New steel rail is to be laid in the vicinity of Merriton and also between Hyde Park and Sarnia.

Oakville, Ont.—Town Council decided to install an auxiliary gasoline engine pumping plant of 150 h.p. Estimated cost, \$32,000. Clerk, Percy A. Bath.

Quebec, Que.—A. E. Robert, president of the Quebec Railway, Light & Power Co. announced that a number of extensions of the system to points in the vicinity of Quebec will be completed in the course of the next few years.

FACTORIES AND LARGE BUILDINGS

Birch Cliff, Ont.—Ratepayers authorized the school trustees to construct four additional class rooms to the present school in S. S. No. 15, at a cost of \$40,000.

Brockville, Ont.—J. Areno, of Smith's Falls, plans erection of business block on Beckwith St.

Brockville, Ont.—Plans are being prepared here for the construction of a consolidated eight-room school at Mountain, Dundas county.

Calgary, Alta.—Work will proceed at once on erection of new church building for Central Christian Church.

Calgary, Alta.—Tenders closed April 23 for alterations and additions to the General Hospital, Bridgeland. City Clerk, J. M. Miller.

Chapleau Tp., Ont.—Township Council passed a by-law providing for the raising of \$75,000 for the purchase of a site, the erection of a school and purchase of equipment. Clerk, T. R. Serre, Chapleau.

Chatham, Ont.—Pennington and Boyd are architects for the new Blessed Sacrament Church which will cost about \$65,000. Tenders have been called.

Cranbrook, Ont.—Board of Education will either erect a new 8-room school or an addition to the Central School. Ratepayers authorized \$60,000 for the work.

Delhi, Ont.—Ratepayers passed by-law to borrow \$15,000 for construction of a two-room continuation school. Clerk, James A. Lawson.

Drumheller, Alta.—Fire destroyed the power plant of the Drumheller Land Co. and the power plant and tippie of the Callie Mine. Loss, \$125,000.

Drummondville, Que.—Contract for structural steel for \$500,000 factory for Dominion Silk Dyeing & Finishing Co., Ltd., and for structural steel for large warehouse for Butterfly Hosiery Co., Ltd., awarded to the Walsh Plate & Structural Works, Ltd., Drummondville.

Fort William, Ont.—Contract for erection of four-roomed brick addition to the Ogden St. school was awarded by the Board of Education to Russell Bros., at \$24,969. Other tenders received were: Klomp & Hardy, \$24,980; Russell & McMahon, \$25,156; Cox & Wilcox, \$25,984.

Fredericton, N.B.—Contract for removing and repairing a building at the York County Municipal Home awarded to Leander White, of South Devon, N.B.

Fredericton, N.B.—A lumber manufacturing plant at Bantalour station, 16 miles south of McGivney Junction on the Transcontinental division of the C. N. R. was destroyed by fire with a loss of approximately \$25,000. The mill was owned by Harold M. Young, of this city.

Galt, Ont.—Ray Hall, Architect, will prepare plans for erection of plant for the International Tank & Silo Co.

Guelph, Ont.—The Granite Cement Block Co. of Port Colborne have removed to this city and will erect a new building.

Hamilton, Ont.—Wentworth County Council may erect High School.

Hamilton, Ont.—Tenders for new Labor Temple were received by John Pryke, 487 Concession St., Mount Hamilton, Secretary of the Hamilton Labor Temple Association, until May 1.

Hamilton, Ont.—Contract for electrical supplies and telephones at the Dunsmore School awarded to Cutley & Breay, at \$10,097, and for plumbing and heating to the Adam Clark Co., for \$71,871.

Harrison, Ont.—Ratepayers decided to recommend the submission of a bylaw authorizing a loan of \$25,000 to a new industry. Clerk, H. J. Hucks.

Kenora, Ont.—Preliminary work has been started by Silverman Bros. on the rebuilding of the former Vereker block.

Lachine, Que.—Contract for erection of building to be used as power plant awarded to Fournier & Freres, Ltd., for \$13,910. Following tenders were also received: Quinlan, Robertson & Genest, Ltd., \$16,700; Newton-Dakin Construction Co., Ltd., \$16,750; H. J. Norton, \$19,260; Josephat Theoret, \$18,175; and F. C. Brunet, \$19,700.

Leamington, Ont.—Contract for erection of St. Michael's Church awarded to B. Bondy, of Chatham.

Leamington, Ont.—High School Board applied to Town Council for \$40,000 for erection of a four-room addition to the school.

Lindsay, Ont.—Municipal Council passed by-laws providing for the raising of \$3,500 and \$1,500 respectively for the enlargement of the Collegiate Institute site and the enlargement of the site of the Central School. Town Clerk, W. R. Alley.

London, Ont.—London Methodist Council has decided to erect a church in Ealing district this summer.

London, Ont.—Members of St. Paul's Cathedral plan erection of new rectory and will remodel present one for institutional building.

Moncton, N.B.—School Board proposes to erect a school in east end of city. Secretary, A. O'Blenes.

Moncton, N.B.—New Baptist Church building will be erected at corner of Highfield and St. George Streets by day labor under supervision of Duncan Jonah. Brick construction. Estimated cost, \$75,000.

Montreal, Que.—Plans for the proposed ten-storey hotel have been prepared by D. J. Spence, architect of this city.

Montreal, Que.—MacVicar & Heriot, architects, are preparing plans for erection of new Fairmount Presbyterian Church, Masson St.

Montreal, Que.—Contract for structural steel for new store at 699 St. Denis St. awarded to the Walsh Plate and Structural Works Ltd., of Drummondville, Que.

Montreal, Que.—Fire destroyed the premises of the J Cowan Chemical Co., Ltd., and the Montreal Cotton Wool Waste Co., Ltd., 173-181 Common St. Loss, \$100,000.

Montreal, Que.—Construction work will start in June on the proposed new theological seminary for the Catholic Society of Foreign Missions of the Province of Quebec.

Monteith, Ont.—Plans are under way to erect a larger building for the Northern Academy here, at an estimated cost of \$100,000. Address Dr. J. B. McDougall, of North Bay.

Montreal, Que.—Permit has been issued for the construction of a convent at the corner of Mount Royal Ave. and Cartier St., to cost \$172,000, and another building at the corner of Notre Dame and Joliette Streets, to cost \$62,000.

Montreal, Que.—The construction of a ten-storey hotel in the vicinity of Windsor Station is under consideration and will likely take definite form within a short time. Plans have been prepared for such a building, comprising a main building and two wings, the cost of which would be around five million dollars. A company will be formed to finance the project.

Nepcan Tp., Ont.—Tenders will shortly be called for the proposed High School, estimated cost \$50,000.

Niagara Falls, Ont.—Two large concrete buildings are being erected by the Monarch Engineering Co., Lewis Ave. Estimated cost, \$152,000.

Niagara Falls, Ont.—Contract for sub-station let by local Hydro Commission to the Robertson Construction Co., at \$67,190. Other tenders were: Canadian Engineering Co., \$67,100; R. Smith & Sons, \$78,406; R. Bennett, \$78,975.

Niagara Falls, Ont.—Work on the construction of the new booster pump house at Falls View will be carried on by day labor under the supervision of the superintendent of the Waterworks Commission. Contract for the electrical work was let to Smith & Hughson.

Normandin, Que.—Erection of two schools is projected.

Ottawa, Ont.—Reeve Fred Bell, J. E. Caldwell and Henry Washington, representing Carleton County Council submitted plans to the City Council for an addition to the Court House.

Petite Cote, Ont.—Contract for erection of Sacred Heart Church awarded to Benjamin Bondy, of Chatham, and the plumbing and heating to C. E. Greenan, of Windsor. Estimated total cost, \$100,000.

Port Credit, Ont.—Plans for the proposed social centre building and Sunday School of the Port Credit Methodist Church are being prepared by W. G. Burns, local architect. Estimated cost, \$22,000.

Preston, Ont.—Bulk and separate tenders will be received by John Cowie, Secretary, Preston Public School Board, until 4 p.m., Monday, May 8, for the erection of a school building on Moore St. Plans and specifications may be seen at the office of the Secretary and at the office of F. W. Warre, Architect, Home Bank Bldg., Hamilton.

Regina, Sask.—Western Development Co., Ltd., will erect a business block this summer on the corner of Hamilton and Davin Streets, at cost of \$80,000. Contract has been awarded to the Poole Construction Co.

St. Anne de Beaupre, Que.—The temporary chapel to be erected is estimated to cost \$20,000. A Juvenile is also being erected at a cost of \$10,000.

St. Catharines, Ont.—Members of Westminster Presbyterian Church plan erection of new church on Queenston St. Pastor, Rev. A. W. Thomson.

St. Catharines, Ont.—Board of Education let contract to the W. H. Yates Construction Co., of Hamilton, Ont., at \$420,977, for the new Collegiate Institute and Vocational School. Following tenders were also received: All trades—A. B. Robertson, Niagara Falls, \$563,491; Page & Co., Toronto, \$487,000; Norman McLeod, Toronto, \$489,000; S. E. Dinsmore Co., Ltd., Windsor, \$493,607; Newman Bros., Ltd., St. Catharines, \$515,000; Witchall & Son, Toronto, \$486,389; Witchall & Son (except mechanical trades), \$403,709; P. H. Secord & Son, Brantford (not including plumbing, heating, ventilating and electric wiring), \$365,000; Carswell Construction Co., Toronto, \$480,000; Dickie Construction Co., Toronto, \$497,784; Anglin-Norcross, Ltd., Toronto, \$477,800. Electrical work—Beattie McIntyre Ltd., Toronto, \$9,350; Ramsden & Roxborough, Toronto, \$8,500. Plumbing, heating, ventilating and electric wiring, P. H. Secord & Son, Brantford, \$77,000 and \$1,500; plumbing, heating and ventilating, Purdy Mansell Ltd., Toronto, \$69,500; heating and ventilating, John Peart, St. Catharines, \$60,439; heating, ventilating, temperature control and pipe covering, E. Cardwell, Welland, \$62,000; plumbing, S. P. Goulay, St. Catharines, \$21,485; plumbing, heating and ventilating, W. J. McGuire, Toronto, \$75,500; miscellaneous iron work, Canada Wire & Iron Goods Co., Hamilton, \$9,939; ornamental iron, Shipway Iron, Bell & Wire Co., Toronto, \$12,110; plumbing, heating and ventilating, W. G. Edge, Ltd., Toronto, \$69,400.

St. John, N.B.—John Flood & Sons have been awarded contract for building new school in Holy Trinity Parish. The tenders submitted were: George Lawson, \$84,850; J. Corbett, \$82,273; H. O. Clarke, \$78,000; Munro, \$76,400, plus \$2,800 for stone corners; B. Monney & Sons, \$77,735; J. A. Grant & Co., \$76,000; John Flood & Sons, \$73,000.

St. Thomas, Ont.—A campaign will be launched on May 2 to raise \$35,000 for improvements and extensions at Alma College. Chairman of Committee, Walter F. L. Edwards.

Sarnia, Ont.—Following a recent meeting of directors of the Dominion Alloy Steel Corporation, it was announced that some changes in the plans of the company have been made, and the plant to be erected will cost \$5,000,000 instead of \$3,000,000.

Scarboro Tp., Ont.—Bulk and separate tenders will be received by W. D. Annis, Secretary, School Board, until 5 p.m., Monday, May 8, for the erection of a High School building at the junction of St. Clair Ave. and Kingston Road. Plans and specifications may be obtained at the office of Burden, Gouinlock & Carter, Associated Architects, 101 King St. West, Toronto, or seen at the office of the Secretary, Council Chambers, Birchcliff, Ont.

Smith's Falls, Ont.—International Button Co. plans erection of new factory and purchase of machinery.

Sudbury, Ont.—Permit issued for two-storey brick La-berge Block on Louis St. cost \$22,000. Application has also been made for a two-storey brick block to be known as the Davis block on Borgia St.

Sudbury, Ont.—Permit issued for four-roomed Separate School building on Shaughnessy St. It will be a two-storey brick building. A. Bernier has the brick contract and L. Lacosse the frame work contract. Estimated cost \$33,000.

Swan River, Man.—Fire destroyed the Agnew and Taylor blocks, causing a total loss of \$40,000.

Toronto, Ont.—A site has been chosen for the erection of new Machinery Hall at Exhibition grounds. Estimated cost, \$300,000.

Toronto, Ont.—Nos. 91 and 96 Bay St., owned by Sir Henry Pellatt, are to be demolished and a large office building erected in their place.

Toronto, Ont.—A campaign to raise \$10,000 for the enlargement of the Sunday School building has been launched by the Parish of St. Edmund's, Davenport and Dovercourt Roads.

Toronto, Ont.—New Sunday School building will be erected this summer in connection with Parkdale Methodist Church. Pastor, Rev. A. T. Addison. Estimated total cost, \$51,000.

Toronto, Ont.—Members of the First Canadian Church, 693 Bathurst St., plan erection of church building on the corner of Ossington and Burnfield Avenues. Pastor, Rev. C. J. Felton.

Toronto, Ont.—Parish Hall of St. Matthew's Church is to be enlarged at a cost of \$10,000. The heating system will be renovated at cost of \$7,000. Rector, Rev. W. E. MacKay.

Toronto, Ont.—The governors of Havergal College have decided to erect a new building on St. Clair Ave., midway between Yonge St. and Avenue road. Excavation will be begun either next fall or in the spring.

Toronto, Ont.—Second reading was given to a bill by the Provincial Legislature to permit Upper Canada College to make a loan of \$100,000 to build an addition to the Preparatory School and a science wing to the main building.

Toronto, Ont.—Parks Committee acquiesced in the application of Dr. Hastings, M.O.H., for permission to erect the new Home for Nurses in connection with the Isolation Hospital on a site in Riverdale Park, near the existing hospital buildings.

Toronto, Ont.—Toronto Transportation Commission plans to erect buildings on the site of the old Hillcrest race track at a cost of approximately \$1,000,000. Over and above this expenditure will be the cost of track and layout and the erection of a stores building.

Toronto, Ont.—Separate or bulk tenders for the erection of a fire hall on Commissioner St. will be received until 12 o'clock noon, Tuesday, May 9, addressed to C. A. Maguire (Mayor) Chairman, Board of Control. Plans and specifications may be seen at the office of the City Architect.

Toronto, Ont.—Board of Education awarded following contracts: Givins St. School—masonry, Jas. W. Hewitt, \$6,600; structural steel, Hepburn & Disber, \$620; carpenter work, R. Campbell, \$6,750; roofing, E. Lankin & Son, \$797; plastering, R. C. Dancy, \$1,300; painting, Jas. Casey, \$786; plumbing and heating, W. G. Edge Co., \$2,198; electric wiring, Toronto Electric Co., \$475; local phones Bates & McPherson, \$90; asphalt mastic, Carmichael Waterproofing Co., \$286. Parkdale School—Masonry, H. Lucas & Son, \$18,840; structural steel, Hepburn & Disber, \$1,380; carpenter work, R. Campbell, \$9,200; ornamental iron, Ornamental Iron Products Ltd., \$569; roofing, E. Lankin & Son, \$759; plastering, A. D. Grant, \$2,200; painting, F. Booth & Son, \$1,057; plumbing, Sheppard & Abbott, \$1,026; heating, Sheppard & Abbott, \$3,068; electric wiring, Toronto Electric, \$635; asphalt mastic, Carmichael Waterproofing Co., \$157. Rose Ave. School—Plastering, R. C. Dancy, \$7,664; ornamental iron, Ornamental Iron Products, Ltd., \$2,444; painting, Phinnemore Painting Co., \$3,980; local telephones, Bates & McPherson, \$500. North Toronto High School—Plastering, R. C. Dancy, \$7,600; asphalt mastic, W. A. Moffatt, \$680; painting, James Casey, \$3,300; terrazzo floors, Italian Mosaic & Marble Co., \$3,959.

Valleyfield, Que.—Structural steel contract for new theatre awarded to the Walsh Plate & Structural Works, Ltd., of Drummondville, Que.

Welland, Ont.—City Council will likely secure plans shortly for the proposed new library building. City Clerk, W. E. Forster.

Welland, Ont.—The enlargement of the Welland County General Hospital is projected. Chairman, W. J. Healey. Estimated cost, \$60,000.

Welland, Ont.—The St. Thomas Packing Co. has purchased a site at the corner of Division St. and Helme

Ave. for the erection of its proposed new cold storage plant.

Welland, Ont.—Lackawanna Steel Tubes Ltd., a recently incorporated concern, has taken over the Welland Machine & Foundries Ltd. A new mill building will be erected 80 ft. by 400 ft. The company will manufacture seamless steel tubes.

Willowdale, Ont.—Ratepayers decided to purchase a site at Lansing for erection of four-room school.

Windsor, Ont.—Local branch of the Navy League of Canada plans erection of a shore station and clubhouse at a cost of \$5,000.

Winnipeg, Man.—Plans are being prepared by Jordan & Oliver, architects, for the construction of a one-storey office building at the corner of Garry St. and Ellice Ave. for Stevenson, Feilde & Crable. Estimated cost, \$20,000.

Winnipeg, Man.—Tenders will be received at the office of the Winnipeg Public School Board until 5 p.m., Thursday, May 4, for the erection of a stone and brick 14-room school on site between Flora and Stella Streets, Sec.-Treas., R. H. Smith.

MISCELLANEOUS

Bosanquet Tp., Ont.—Township Council plans drainage work at estimated cost of \$70,000. Clerk, Geo. Sutherland, Thedford, Ont.

Calgary, Alta.—Tenders, addressed to the City Commissioners, will be received at the office of J. M. Miller, City Clerk, until 5 p.m., Wednesday, May 10, for a 2-2½-ton chassis, with power-driven capstan winch, 2,000-lb. pull, all in accordance with specifications obtainable from Mr. Mackay, Superintendent, Electric Light Department, City Hall.

Lethbridge, Alta.—Tenders for furnishing 13 cast iron gates will be received until 2 p.m., May 16, by the Irrigation Council, Lethbridge. (See official adv.).

London, Ont.—The London Bridge Co., a subsidiary company of the Structural Steel Co., of Welland, has been organized with a capital stock of \$100,000. Three acres of land have been purchased in East London, and a plant will be equipped as soon as possible.

Montreal, Que.—Provincial charter has been granted to Crushed Stone & Construction, Ltd., capitalized at \$49,000. C. Alfred Sylvestre is a director.

Petrolia, Ont.—Dominion charter has been granted to McMurray Asphaltum & Oil, Ltd., capitalized at \$100,000. Thos. Draper is one of the directors.

St. Adele, Que.—Contract for new steel penstock for Rolland Paper Co., Ltd., awarded to the Welsh Plate & Structural Works, Ltd., of Drummondville, Que.

Toronto, Ont.—City Council passed by-laws authorizing the issue of debentures totalling \$1,589,000. The money is required for the following works: New bridge over the Don at Gerrard Street, \$762,000; purchase of land for Boulevard Drive between Dowling Ave. and Dufferin St., \$210,000; harbor improvements at Sunnyside, \$411,000; site for new Observation Home, \$25,000; Nurses' Home, in connection with the Isolation Hospital, \$100,000.

Welland, Ont.—Tenders will be received by C. L. Coulson, City Engineer, until 4 p.m., Thursday, May 4, for all work and material required for the construction of piers and lattice fences at the entrance to Chippewa Park.

Welland, Ont.—Hydro-Electric Power Commission of Ontario let contract for dredging on the Welland River and earth section of the canal, in connection with the Queens-County-Chippewa power development, to Lachay & Co., the contract amounting to between \$100,000 and \$500,000.

Winnipeg, Man.—Contract for 40 manhole covers awarded to Western Prairie Foundry Co., Portage la Prairie, at \$25 a set.

Woodstock, Ont.—Drains for Maud and Dufferin Streets are contemplated. Clerk, James C. Haight.

The Canadian Engineer

A Weekly Paper for Civil Engineers and Contractors

Activated Sludge Plant at Brampton, Ontario

Sedimentation Tanks Reconstructed for New System — Capacity 300,000 Gal. per Day — Four-Hour Aeration Period — Diffusion Ratio 4.8 — Sludge Dewatered in Tank — Used as Fertilizer — Troubles Overcome

By W. M. TREADGOLD

Associate Professor of Surveying, University of Toronto.

Engineer, Town of Brampton

CONSTRUCTION of a sewerage system for the town of Brampton was commenced in 1907 and the system put into operation in the fall of 1908. Owing to the fact that the town proper was located on low ground, with the Etobicoke River running through, it was an easy matter to provide for storm drainage and so it was considered advisable to use the separate system for sanitary sewers. The main drain was a 15 in. vitrified pipe on a 0.25% grade with branches which served the north-east and west sections of the town, and later, in 1916, a second 15 in. main was constructed to serve the south and south-west sections. There are over 10 miles of

and stability of the effluent, and on account of the comparatively small volume of sewage to be treated, no trouble was anticipated from the disposal of the sludge.

Activated Sludge Plant Recommended

Accordingly, an activated sludge plant was recommended which involved the reconstruction of one side of the sedimentation tanks for use as an aeration tank, the construction of a settlement tank, compressor house and open sludge beds. Neither the cost of construction nor the cost of operation promised to be much higher than for any other method of treatment, and, on account of the

FIG. 1—LONGITUDINAL SECTION OF PART OF ACTIVATING TANK

streets sewered at the present time, which represents about 60% of the total mileage of streets in the town and the amount expended to date is about \$150,000, including the disposal plant and site. Sedimentation tanks were designed to take care of the disposal. These, although cleaned out periodically, very soon gave rise to complaints and the water in the stream became badly contaminated and injunctions were threatened.

Finally the town authorities decided to ask the engineer for a report on a system of sewage purification that would alleviate the nuisance and be satisfactory to the Provincial Board of Health. In the operation of the sedimentation tanks, there was only a difference in elevation of 5 ft. 6 in. between the inlet and low water level of the stream, so that it would have been necessary in constructing sprinkling filters to use a low lift pump, as there would not have been enough head to ensure proper operation. Favorable reports had been made of the success of the activated sludge method of treatment and it has proved that excellent results could be obtained in the character

fertilizing value of the sludge it would easily be disposed of. At the present time, the Dale estate, owning the largest conservatories in the country, are taking all the sludge from the plant and pay for the cost of handling it from the beds to the conservatories. They had previously tried out the sludge from the sedimentation tanks which proved unsatisfactory. The results obtained in experimenting with the activated sludge were very gratifying. Their experiments have not been so much of a technical character as of a practical nature and the usefulness of the sludge has been quite marked in the cultivation of their famous American Beauty roses. The best results seemed to have been obtained in the second season after the soil has been treated with the sludge which has been dried and finely powdered.

Tenders for the work were called in the fall of 1918 and the contract awarded to G. G. Reid. A description of the plant itself may be divided under four heads.

One of the pair of sedimentation tanks is shown in partial longitudinal section and cross-section in Figs. 1 and

2 respectively. It is divided into six compartments by cross walls and was reconstructed by deepening 4 ft., and by building a sloping side wall at an angle of 45 deg. with arched openings in each of the cross walls with the exception of the centre one. This sloping wall gave the sewage

FIG. 2—CROSS-SECTION THROUGH PRESENT TANKS — HATCHED PORTION SHOWS RECONSTRUCTION

and sludge a revolving motion at right angles to the direction of flow and kept the activated sludge well mixed with the raw sewage. The superficial area of the tank was 1325 sq. ft. and the cross sectional area 84 sq. ft. Its capacity is 52,500 Imperial gals., which at the maximum rate of 300,000 gals. per day means that it would give about a 4-hour aeration period. The centre cross wall was carried straight down so as to divide the chamber into two parts each part being complete and capable of being used with proper pipe drains and valves so as to be independent of the other section in case repairs has to be made to the filtros plates or air lines. Three rows of filtros plates supplied by the General Filtration Co., of Rochester, N.Y., each plate 12 by 12 by $1\frac{1}{2}$ in. giving a plate area of 275 sq. ft., or a diffusion ratio of 4.8 which is rather smaller than in some plants in operation. No trouble has yet been experienced with these plates, through breakage or clogging. A 5 in. air line with a 2 in. connection to the under side of the filtros plates. Blow-off connections are made to take care of any water accumulating under the plates. Ventilators and windows were provided and at any time during operation there is no disagreeable odor or smell. Sufficient sludge is returned to keep the amount of sludge in the aeration tank at about 25%.

Settling Tank

At the end of the aeration chamber a settling tank shown in Figs. 3 and 4, was constructed 16 by 30 ft. inside and 22 ft. below water level. It is divided into two chambers each with a hopper bottom 4 by 4 ft. Two channels, one for each compartment, lead from the aeration chamber. A 3 by 10 in. cypress baffle board forces the flow to the bottom of the tank and the effluent runs over collecting weirs which lead to channels that connect with the 15 in. drain pipe to the river. The two chambers are about three quarters the size of the aeration chamber. A 6 in. sludge pipe runs down to within one foot of the bottom of each chamber and has a $\frac{3}{4}$ in. air pipe down far enough to discharge the sludge up through this pipe by compressed air either out to the sludge beds or back to the sludge return pipe which empties into the aeration chambers.

Compressor House

The building for the compressor and motor is directly over the settling tank. At present, the plant is operated by a No. 4 Nash Hytor compressor direct-connected to a 30 h.p. Westinghouse motor, 3-phase, 25-cycle, 550-volt, at 480 r.p.m. The compressor runs at an actual working

pressure of about 5 lbs. and delivers about 450 cu. ft. of air per minute, which in the daytime means about 2.1 cu. ft. of air per gallon of sewage. This is somewhat in excess of the amount of air used in some other plants. It is the intention to instal a second unit of smaller capacity in the near future which could be used at night when the amount of sewage is considerably less than the amount treated during the daytime. The air delivered by this machine has an advantage over that furnished by other types of compressors where it is to be diffused by perforated plates, in that the compressor washes the air as it is being compressed and so cleanses it that there is less chance of the plates becoming clogged with dirt or grease.

Sludge Bed

Two open sludge beds were excavated each about 20 by 80 ft. and varying in depth from 3 ft. at one end to 5 ft. at the lower end. At first the sludge was run directly into these. There it was allowed to dry and then thrown out on the bank and carted away. This drying out process was slow. Last year the beds were filled during the summer and fall and in the winter the sludge would freeze and could be conveniently removed. With a view to dewatering, to some extent, a small concrete tank 8 by 10 by 3 ft. deep was constructed which was sufficient to take care of the sludge discharged every second day. The sludge was emptied into this and allowed to settle for 6 or 7 hours. Then the water was drawn off amounting to from 40 to 50% of the content and turned back into the tanks the remaining sludge being then run off into the sludge bed. This result-

FIG. 3—CROSS-SECTION OF SETTLING TANK

ed in a saving in the amount of sludge turned into the drying beds and it was found that only an average of 2 cu. yds. per day reached these beds.

The plant has now been running since April, 1919, and has proved very satisfactory. The compressor runs at intervals—continuously from 7 p.m. to 8 a.m., and from 11 a.m., to 4 p.m., or 18 hours per day. It has been found that no serious change in the effluent occurs during this three hour interval and there is a saving in the cost of power as the periods when the compressor is not working are the periods when the peak load comes. Up to the present a man has been kept in attendance during the day who has taken a great interest in the operation of the plant and who has been kept there to deal with some of the troubles of operation which are always present in a new system, especially one that has been the result of changing from the original design to one that the plant was never intended for. It has added to the cost of operation but it was considered advisable to get good operation before cutting down on the attendance. It might be worth while to consider some of the troubles that developed and which have been remedied.

Variable Effluent

The effluent at one time would run clear and stable and not long after, for no apparent reason, the fine sludge in the settling tank would rise up and overflow the weir and run out to the stream with the effluent and pollute the stream. That was accounted for partly by regulating the discharge of the sludge pipe. If this were too great it would stir up the settled sludge too much and the sludge would rise up and overflow into the outlet. Also it was found that refuse and grit would block up one of the channels leading from the aeration chamber to the settling tank and thus all the flow would be through one section of the settling tank. The grit and seeds would settle in this channel, because the rate of flow was small. This channel is now cleaned regularly and the trouble has disappeared. Again, there have been stoppages of power at night and the plant would not be in operation. This is being remedied by installing an automatic cut in so that when the power comes on again the motor will start up.

In a separate system some storm water is bound to get into the mains either through roof water being connected up to the drains or through privileges that have been previously granted to manufacturing firms to take care of storm drainage, and it is found that whenever a heavy rain occurs the sudden inflow of water will tend to carry away the activated sludge in the tank and there will not be sufficient left to ensure good action with the incoming sewage and it will take some time to build up the sludge to standard efficiency. It now arranged to by pass this heavy flow when it becomes greater than the plant can accommodate through the tanks.

During the first year a deposit of lime formed on the rotor of the compressor and the machine had to be taken down. The water used for circulation was very hard. A recirculating system using soft water was installed which worked satisfactorily but last summer the water delivered through the mains was much softer and this extra equipment was not necessary. The compressor when operating made considerable noise which would have been serious had the plant been near any residences. This noise has been reduced very much by running the inlet pipe out through the wall and reducing the 5 in. pipe with a reducing coupling in which a 2½ in. nipple 6 in. long is joined.

The plant is now treating about 250,000 gals. per day and about 2 cu. yds. of sludge reaches the drying bed every day. The original cost of the sedimentation tanks

was \$8,000 and the total cost of converting to the activated sludge process was \$17,000. The power consumption runs at an average of \$1.50 per day. The attendant receives \$3.00 per day. The effluent obtained is stable, colorless and odorless. Frequent tests are made for stability by

FIG. 4—LONGITUDINAL SECTION OF SETTLING TANK

means of methylene blue solution. The stream into which the effluent discharges has changed remarkably and runs clear. There has not been any further complaint from any of the property owners abutting on the stream below the outlet.

INCREASE IN ASPHALT PAVEMENT YARDAGE

AMERICAN cities are making tremendous strides in street paving said Joseph R. Draney, president of the Asphalt Association at a meeting of the Association in New York recently. Reports from city engineers show that over 30,000,000 sq. yds. of asphalt equivalent to 1,750 miles of pavement 30 ft. wide, were laid on city streets last year. Twenty-three million square yards were laid on state highways and the area laid on county and district roads brought the total for 1921 up to 68,000,000 sq. yds., enough to build two roads, each eighteen feet wide, the one extending from Augusta, Me., to San Francisco, Cal., and the other from Augusta, to New Orleans. Despite the industrial depression that existed throughout the year, 1921, was the greatest year in the history of the asphalt business.

Lackawanna Tubes, Ltd., has taken out a Federal charter, with an authorized capitalization of \$525,000. This organization has taken over the plant and equipment of Welland Machine and Foundries, Ltd. The principal product will be boiler tubes. This is understood to be the first firm to produce seamless steel tubes in Canada. Imports of such products from the United States have been a sizable item.

Beach Water Works Pumping Plant at Hamilton

General Description of Machinery, With Special Reference to Recent Installation of Two Ten-Million-Gallon Pumping Units — Tests Show Efficiencies as High as 80 Percent — Historical Review of Earlier Equipment

By R. DE BRUNO-AUSTIN

Managing-Director, Turbine Equipment Co., Ltd., Toronto

ONE of the most interesting features of the Beach Pumping Station, which supplies water to the city of Hamilton, is that the pumping machinery installed there contains examples of the earliest and most modern types. The former consists of two vertical beam type compound condensing engines direct connected to plunger pumps, and were installed in 1859. They operate condensing, the vacuum carried being 24 in., referred to a 30 in. barometer. The jet condensers, as well as the air pumps, are submerged in a tank of water. This tank is kept full by using cold water pumps, taking supply from the suction pipe of the main pumps. The air pumps obtain their supply from these tanks, through jet condensers, and discharge into a cast-iron box which is connected to the sewer. The exhaust from the low-pressure cylinders discharges into the condensers.

The high-pressure cylinders are 20 in. bore by 6 ft. stroke, and the low-pressure 40 in. bore by 8 ft. stroke. Each engine has a fly wheel 24 ft. in diameter, weighing 24 tons. The capacity of each unit is 1,800 Imperial gals. a minute. The height from the foundations is 51 ft., extending through three floors. The dimensions of the foundations are 51 by 24 ft.

These engines were built by the John Gartshore Co., Dundas, Ont., and were originally designed to work against a pressure of 80 lbs. per sq. in., steam being supplied to the cylinders at a pressure of 30 lb.

The capacity of each pump was originally 38½ gals. a stroke, or 77 gals. for each revolution of the crank shaft. In 1882, they were enlarged to give a capacity of 60 gals. a stroke, or 120 gals. a revolution. The steam ends, however, were not altered, although a new battery of boilers, consisting of two 78 in. by 16 ft. horizontal return tubular, was purchased, which enabled the steam pressure to be increased to 60 lbs. per sq. inch. In 1892 it was decided to increase the steam pressure to 70 lb.

In 1887 and 1888 two cross-compound horizontal condensing engines, connected to plunger pumps, were purchased,

each having a capacity of 4,250,000 Imp. gals. a day. The high pressure cylinders are 22 in. diameter by 36 in. stroke, and the low pressure cylinders are 44 in. diameter by 36 in. stroke. The dimensions of the foundations are 56 ft. long by 46 in. wide.

The valves on the steam end are of the slide valve type. The pump valves are of the Corliss type, and there are 560 in each valve chamber. The 13½ in. diameter plungers are hollow cast iron, or what is known as the floating plunger. These plungers work in bronze sleeves bolted in the centre of the pump chamber or cylinder. The rods carrying these plungers are outside packed. Jet condensers are used and the vacuum carried is also 24 in., referred to a 30 in. barometer. This machinery was built by the Osborne-Kelley Manufacturing Co., of Hamilton.

A battery of five 54 in. by 14 ft. horizontal return tubular boilers was purchased at the same time as the above-described pumps. During the test they developed a duty of 114,000,000 ft. lb. per 1000 lb. of steam.

In 1910 the city decided to use electrical power for pumping their water supply, and to retain the steam-driven pumps as an auxiliary to be used during interruptions to the electrical power. Therefore tenders were called for synchronous-motor-driven centrifugal pumps. The John McDougall Co., Montreal, Que., were awarded the contract for two 16 in. 2-stage turbine pumps, direct-connected to 630 h.p. Canadian Westinghouse synchronous motors, operating at a speed of 750 r.p.m. The capacity of each pump was to be 6½ million Imp. gal. a day against a total head of 300 ft. At that time the John McDougall Co. was the only concern in Canada building pumps of this type. Their chief engineer was W. C. Browne, who was formerly with the Worthington Pump Co., of New York.

These pumps have what is known as the Jaeger (Leipzig, Germany) method of hydraulic balance against end thrust. This system of individual impeller balancing is not proof against end thrust, however, and substantial marine type of thrust bearings are furnished to augment

it. They were first tested in January, 1911, but did not meet the builders' guarantees either for capacity or efficiency. Larger impellers and diffusion vanes were then installed, and in June, 1912, James Bain, the chief mechanical and electrical engineer of the city of Hamilton, and an engineer representing the builders, made another test which was quite satisfactory. The pump efficiency guaranteed was 72%, and that obtained after the changes to impellers and diffusers was 72.74% on No. 1 unit and 77% on No. 2 unit. The latter was considered at that time an extremely good result.

In the summer of 1912 it was decided to increase the electric pumping capacity, and a contract was awarded to the Canada Foundry Co., of Toronto, for two 16-in. 2-stage turbine pumps of Mather & Platt design. The capacity of each was to be 6½ million Imp. gal. a day against

PLAN OF DE LAVAL TURBINE AND MOTOR-DRIVEN PUMPS SHOWING CONDENSER AND PIPING ARRANGEMENT

285 ft. total head, and they were to be direct connected to 650 h.p. Canadian General Electric 3-phase, 25-cycle, 2,200 volt, 750-r.p.m. synchronous motors. The city's specifications contained a clause that no efficiency under 80% would be considered, and despite the fact that many European pump builders submitted tenders, the Canada Foundry Co.

TEN-MILLION-IMP.-GAL.-A-DAY DE LAVAL MOTOR-DRIVEN PUMPS AT HAMILTON WATER WORKS

was the only concern which agreed to guarantee this efficiency. They had at that time been building this type of pump for about a year.

Mather & Platt are well-known English manufacturers of electrical and mechanical machinery and have been building turbine pumps since 1876, and are still one of the leading authorities in Europe. They and Sulzer Bros., of Switzerland, first introduced what is known as the hydraulic balance valve for providing against end thrust, about the same time, in 1906. With this system a disc is connected on the shaft beyond the last impeller on the discharge side and automatically provides against end thrust, no thrust bearings being required. It is now generally in use by the leading pump manufacturers all over the world.

These pumps also failed to meet their guarantees at the first time of testing. A test was made in August, 1914, and at the stipulated head each pump was approximately 500,000 gal. a day low in capacity, and 8% low in efficiency. The builders then substituted new impellers and diffusion vanes, this time designing them for 300-ft. total head instead of 285 ft., and they were again tested in August, 1915, but still fell short of the rated capacity of 6½ million gal. a day at a head of 300 ft. They gave slightly over this capacity, however, at 285 ft., with an efficiency of 76%, which was 4% lower than the guarantee.

On September 21, 1918, after further changes, another test was made on one unit and an efficiency of a little over 78% was obtained. In May, 1919, the second one was tested and the very good efficiency of 81.9% was obtained.

After the summer of 1915 it was realized by the engineers that the steam pumping capacity was inadequate, and A. F. Macallum, who was then city engineer, obtained estimates on a 15,000,000 gal. steam-turbine-driven pumping unit, with condensing plant, boilers and appurtenances, which he submitted to the Board of Control, but no action was taken.

Later Mr. Macallum resigned his position to become Commissioner of Works at Ottawa, and E. R. Gray was appointed to fill the vacancy. Both he and Mr. Bain continued

to urge upon the city officials the necessity of increasing the steam pumping capacity, which was only 13½ million Imp. gal. a day as compared with 26 million electrical. Moreover, the 57-year-old Gartshore pumps could not be relied upon, and for that matter the Osborne-Kelley pumps were in need of extensive repairs.

On August 3, 1916, at a joint meeting of the Board and a sub-committee of the Works Committee, it was decided to ask James Milne, chief mechanical and electrical engineer of the city of Toronto, to visit Hamilton and make a report as to the best method of increasing the city water supply. Mr. Milne, in his report, drew attention to the insufficiency of the steam pumping capacity and recommended the purchase of a unit of 15,000,000 Imp. gal. a day capacity, with the least possible delay. Mr. Milne submitted estimates on three different types, namely (a) vertical triple-expansion high-duty reciprocating pumping engines, (b) turbine-driven geared centrifugal, and (c) high-speed vertical-engine-driven centrifugal pumps, at costs, including foundations, boilers, buildings, piping, etc., of \$241,585, \$131,080 and \$142,105 respectively, and pointed out that a steam-turbine-driven geared centrifugal similar to those installed at the main and high-level pumping station in Toronto, would be more economical than the vertical triple-expansion or high-duty pumping engine, even though the steam consumption were greater, due to the much higher interest and depreciation charges which would have to be provided for the more expensive machine. So far as the vertical-engine-driven centrifugal was concerned, his report showed that not only was the first cost higher, but also the steam consumption.

Shortly afterwards a committee which included E. R. Gray and James Bain visited several cities in the United States for the purpose of obtaining information as to the merits of the two different types of pumping machinery and other information.

On September 4, 1916, Mr. Bain submitted a comprehensive report to the Board of Control on the whole water works situation, in which he reviewed the Hamilton water supply from its inception, including pumping machinery, mains, intakes, filtering basins, conduits and reservoirs. He recommended the installation of a duplicate pumping system, a new 48-in. discharge main to be laid from the Beach Pumping Station to the city which would enable 45 million gal. each 24 hrs. to be pumped, a new 72-in. steel intake to be carried well out into the lake, the abandonment of the so-called filtering basin due to its inefficiency, a new 72-in. conduit from the basin to the pumping station, also a connection to be not less than 48-in. from the Beach Pumping Station to the main leading from the Barton Reservoir to the distributing mains in the city.

Mr. Bain also reported adversely against the proposition submitted by the Dominion Power & Transmission Co. for the city to install a 750-k.w., 25-cycle turbo-alternator in the Dominion Power Co.'s generating station, which could be operated by steam furnished by the power company. The object of this was to maintain a duplicate source of power for the electrical pumps.

Mr. Bain, after pointing out that it would be necessary to install a unit of more than double this capacity to furnish enough power for the centrifugal pumps, gave other sound reasons why it should not be entertained, and recommended that tenders be called for a vertical high-duty triple-expansion pumping engine with a capacity of 20 million Imp. gal. in 24 hr. against a total head of 300 ft., and also on a steam-turbine geared centrifugal pumping unit of the same capacity, and other necessary minor machinery.

A month later the Hamilton Hydro-Electric System submitted a counter proposal to the city embodying the construction of a 20 million gal. reservoir on the mountain,

and mentioned the advantages which in their opinion such a scheme had over the installation of new steam pumping machinery.

When Mr. Bain was handed a copy of this report, he very ably showed the inaccuracy of many of the statements which were made, and among other things mentioned that while a reservoir was a very useful thing to have, without adequate pumping capacity to fill it, it would be of little use. He also submitted figures to refute many of the Hydro Commission's assumptions, with the result that in July, 1917, the Board of Control called for tenders on the following:

One 10 million Imp. gal. a day steam-turbine-driven centrifugal pumping unit.

One 10 million Imp. gal. a day electric-motor-driven centrifugal pump.

One 650-k.v.a., 3-phase, 25-cycle synchronous motor.

Two 750-k.w., 3-phase, 25-cycle transformers.

Switching apparatus.

Two 24-in. venturi meters.

One water-tube boiler.

Contracts were signed by Mayor Booker on October 22, 1917, with the Turbine Equipment Co., Ltd., Toronto, for one \$15-h.p. De Laval steam turbine connected through the medium of double helical speed-reducing gears to an 18-in., 2-stage De Laval pumping unit at a price including condensing machinery and auxiliaries, and all piping and valves inside the pumping station, and to be installed on foundations to be provided by the city, for the sum of \$52,517.

This same company were also awarded a contract for the 10,000,000-gal.-a-day centrifugal pumps, to be driven by electric motor, at a price of \$22,420, installed on city's foundations, including piping and valves, etc.

The contract for the 650-k.v.a. synchronous motor was awarded to the Canadian Westinghouse Co., of Hamilton. The Canadian General Electric Co. received contract for the transformers, etc., and Goldie & McCulloch Co., Galt, for the 400-h.p. water-tube boiler. A. W. S. Roberts, Toronto, representing the Builders Iron Foundry, Providence, R.I., was awarded the contract to supply the two 24-in. Venturi meters.

Deliveries on all the machinery was very much overdue, due to war conditions, and it was not until February, 1919, that the first shipment was made by the De Laval Steam Turbine Co., consisting of the electrical pumps. The installation of the complete unit, consisting of motor, pumps, Venturi meter, valves, piping, etc., was not completed until January, 1920.

On February 5, James Bain and the writer conducted an official acceptance test, the average results of which were as follows:

Capacity in Imp. gal. in 24 hours	10,028,571
Discharge pressure	125.07 lb.
Suction lift	9.75 ft.
Total head	299.92 ft.
Input to motor	621.42 k.w.
Electrical h.p.	833
Water, h.p.	632.92
Motor efficiency	91.5%
Pump efficiency	80.4%
Combined efficiency of motor and pump, ...	75.98%
Speed	741.57 r.p.m.

Owing to this test being made under bad conditions, due to it being impossible to maintain a uniform speed, we made another test on February 8, during which the speed of the motor was fairly constant, and the following average results were obtained:

Capacity in Imp. gal. per 24 hr.....	10,596,154
Discharge pressure	125.65 lb.
Suction lift	9.7 ft.

Total head	301.21 ft.
Input to motor	662.7 k.w.
Electrical h.p.	888.34
Water, h.p.	671.67
Motor efficiency	94.5%
Pump efficiency	80%

TEN-MILLION-IMP.-GAL.-A-DAY STEAM-TURBINE-DRIVEN PUMPS AT HAMILTON WATER WORKS

Combined efficiency	75.6%
Speed	750.23 r.p.m.

Readings were taken at intervals of 10 minutes over a 2-hr. period. The mechanical operation was entirely satisfactory and the unit was accepted by the city shortly after.

The Turbine Equipment Co. guaranteed a pump efficiency of 77 per cent., and in this connection it might be mentioned that as the pump manufacturers were limited to a speed of 750 r.p.m., it was necessary to use much larger pumps than for the steam-turbine-driven unit, in order to accommodate the larger diameter of impellers required, and, therefore, 20-in. pumps were specified as compared with the 18-in. used with the steam turbine. With the motor-driven unit, 31½-in. diameter impellers had to be used, whereas 27.7-in. impellers were large enough to give the head at 850 r.p.m., which was the speed of the reduction gear supplied with the turbine. The capacity of 10 million Imp. gal. a day was really too low for most efficient results with the large pump cases, which give a maximum efficiency at a capacity of approximately 17 million Imp. gal. a day. Under the circumstances, therefore, the efficiency of 80 per cent. can be considered quite satisfactory.

This machine consists of two 20-in. standard De Laval single-stage double-suction bronze-fitted pumps, with suction and discharge branches located in the bottom half of the pump casings. The bronze used in the impellers consists of 88 per cent. copper, 10 per cent. zinc and 2 per cent. tin. The usual De Laval labyrinth type of impeller and case renewable wearing rings are used, and the shafts, which are of open-heart steel, hammer-forged and ground, have renewable bronze sleeves extending from the hubs of the impellers to the outer ends of the stuffing boxes, thus entirely protecting the shafts from contact with the water. The shafts are equipped at one end with marine-type thrust bearings. 20-in. series pipe connects the discharge of the first pump with the suction of the other. It will therefore

be seen that instead of using what is known as a multi-stage pump consisting of two impellers in one casing, two single-stage pumps are used and these are mounted in tandem, the shafts of the first pump and the motor being connected by means of a flexible coupling, and the shafts of the two pumps in the same manner. The water is sup-

ELEVATION OF MOTOR-DRIVEN PUMP

plied to the first pump from a well 5 ft. square, located immediately below it, and this pump discharges the water at a pressure of about 60 lb. to the suction of the second pump, which boosts it to a pressure of from 125 to 130 lb., at which pressure it is sent to the city mains.

The impellers have the usual power-limiting characteristic which prevents an overload being placed on the motor should the head drop from any cause, such as low water in the reservoir or a broken main.

Characteristic curves plotted after the test are reproduced herewith and the very flat efficiency curve obtained is worthy of note. This is due to the absence of guide vanes, which were abandoned by the De Laval Co. several years ago. Certain dimensions of these pumps may be of interest.

The diameters of the pump shafts at the impeller hubs are $5\frac{1}{2}$ in., and at bearings $5\frac{1}{4}$ in.

The length of the straight bearings is 14 in.

The thrust bearings are 14 by $4\frac{1}{4}$ in., there being three thrust collars $5\frac{1}{4}$ in. in diameter.

The centre line of the impellers to the centre line of the bearings is $32\frac{1}{2}$ in.

The installation of the steam-turbine-driven unit was completed in January, 1920, and the machine was first turned over a few days later, and the mechanical operation was quite satisfactory. Mr. Gray soon after made preparations to have it officially started, and on April 23 Adam Brown, the city postmaster, who was one of the first water commissioners of Hamilton, visited the pumping station in company with the mayor and several members of the Board of Control and City Council, for this purpose. Mr. Brown was born in 1826, and was an active member of the Water Commission for a great many years, and was partly instrumental in having the first water works pumping machinery installed in that city. He was amazed when informed that the steam turbine operated at a speed of nearly 5,000 r.p.m., and still more when told that the pumps, which occupy about one-twentieth of the space required by the old Gartshore units, had three times the capacity of the two combined. Under the guidance of the contractors' representative he slowly opened the throttle admitting steam to the turbine, which very quickly came up to speed and was soon sending the full capacity of the pumps through the mains on its way to the city.

A banquet had been prepared in the large new store-room which had been built adjacent to the pumping station and which had been gaily decorated for the occasion, and after-dinner speeches were made by several of those present, including Mr. Brown, who reviewed the growth of the city and the necessary addition to pumping machinery, mains and reservoirs since the installation of the Gartshore pumps in 1859.

About a month later a few preliminary tests made by

the writer demonstrated that the machine did not quite meet the guarantees, and eventually it was found necessary to send a man from the works to make a few changes in the nozzles of the turbines and to rebucket one or two of the wheels.

When this work had been completed another preliminary test was made which showed that the highest duty was obtained at a capacity of 12,000,000 Imp. gal. a day, and the contractor made a request that the official test be made at this capacity, explaining that it was a great advantage to the city to have the 2,000,000-gal.-a-day surplus. Eventually an agreement was reached to have the test run at a capacity of 11,000,000 Imp. gal. a day. On October 30 Prof. Angus, of Toronto University, conducted a test for the city, who were also represented by their chief mechanical engineer, Mr. Bain, while the writer represented the contractor.

The Turbine Equipment Co. had made the following guarantees respecting duty in million foot pounds per 1,000 lb. of steam, including steam used by the auxiliaries:

Temperature of Condensing Water	Vacuum	Duty 305 ft.	Duty 225 ft.
70 deg. F.	28 $\frac{1}{4}$ in.	114.25	95
60 deg. F.	28 $\frac{1}{2}$ in.	116	97.4

This was based on a steam pressure at the throttle of 170 lb. gauge. The contractor also agreed to give the full capacity against a total head of 225 ft. by reducing the speed to 800 r.p.m.

The conditions of the test were that the capacity should be measured by a Venturi meter, the head by a calibrated pressure gauge, and the suction lift by an accurate vacuum gauge. The total steam used, including that required by the vacuum and boiler-feed pumps, was to be charged against the turbine, and no allowance was to be made for heat returned to the boilers in the shape of boiler-feed water heated from the exhaust steam from the auxiliaries.

A bonus was to be paid to the contractor at the rate of \$1,250 for each million footpounds by which he exceeded his guarantees, and a penalty of the same amount for each million footpounds by which the machine fell below its guarantees.

Although the total head for which the pumps were required was 300 ft., they were designed for 305 ft. to allow for friction loss in the condenser and piping.

The contractor computed his duty on the basis of dry saturated steam being supplied at the turbine throttle.

Instead of using the recorder supplied by the Builders Iron Foundry with the Venturi meters, a differential mercury gauge was connected between the inlet end of the meter and the throat, and the difference of pressures read directly to within 0.04 in. of mercury. Using the generally-applied Venturi-meter formula—that is to say, a co-

ELEVATION OF TURBINE-DRIVEN PUMP AND CONDENSER

efficient of 0.99—the velocity through the throat was computed from this pressure. Where H is the number of feet of water corresponding to the differential gauge reading, the throat velocity for the meter equals $1.022 (2GH)^{0.5}$. These readings were taken at 5-minute intervals, as also were the suction and discharge gauge readings.

The discharge gauge was calibrated by a dead-weight tester both before and after the completion of the test. Instead of the ordinary spring vacuum gauge, which seldom reads accurately, a mercury manometer was connected at a point just near the pump suction flange. A mercury vacuum gauge was also installed at a point just above the

END ELEVATION, TURBINE AND MOTOR-DRIVEN PUMPS

exhaust flange of the turbine, to register the vacuum, and a calibrated pressure gauge, also tested both before and after the duty trial, was connected in the steam piping near the throttle valve.

The steam used by the turbine, after being condensed, was pumped by the vacuum pump from the condenser to tanks placed on calibrated scales, where it was weighed at certain periods. Two tanks, each mounted on scales, were used, so that one could be filling while the other was emptying.

During ordinary operation the steam from the vacuum and boiler-feed pumps exhausts into a Cochrane heater and is used for heating the boiler-feed water, and during the test careful records were taken of the speeds of these machines every 15 minutes, and at the end of the duty trial of the main unit, which lasted 6 hours, the exhaust outlets of these two pumps were connected to a tank containing cold water. They were then operated at the same speeds again, and the rise in the level of the water noted, and their steam consumption thereby computed.

Fifteen-minute readings were taken on the steam pressure gauge and of the vacuum at the turbine exhaust, also of the turbine and pump speeds. The quality of the steam entering the throttle valve was determined by a throttling calorimeter.

Due to the boiler being quite a distance from the station in which the turbine and pumps are installed, the moisture content of the steam was unusually high, namely, 2.37%. As previously mentioned, the Turbine Equipment Co. had guaranteed their duty on the basis of dry saturated steam, and this was the subject of a dispute. Prof. Angus eventually allowed for all moisture over 1.5%, which is generally considered "commercially dry steam." This would mean that an allowance of 0.87% had to be made when computing the duty of the unit. The contractor, however, cited cases where 2% had been allowed for each 1% moisture, and pointed out that this was a generally accepted theory of steam turbine engineers, and Prof. Angus, after giving the matter careful consideration, finally agreed to it. This, therefore, was equivalent to an allowance for moisture of 2 times 0.87, or 1.74%.

The average vacuum reading recorded was 28.32 in. with 30.06-in. barometer, which is equivalent to 1.74 in. absolute pressure, and this was so close to the 28 1/4-in. equals 1.75-in. absolute referred to a 30-in. barometer, that a straight line variation of duty with absolute pressure was assumed, and therefore the guarantee duty reduced to 1.74 in. absolute is 114.32 million ft.-lb. as compared to the contractor's guarantee of 114.25 ft.-lb. at 1.75 in. absolute.

The average results of the trial were as follows:

Average capacity each 24 hr. in Imp. gal.	11,110,000
Head on discharge gauge	291.95 ft.
Suction lift	16.20 ft.
Correction for elevation difference in gauges	2.25 ft.
Total head	310.4 ft.
Steam Pressure	169.7 lb.
Vacuum	28.32 in.
Barometer	30.06 in.

Speed of pumps	845 r.p.m.
Water h.p., ...	725
Pump efficiency	80%
Brake h.p., ...	909
Steam consumption of turbine in lb. per hr.	11,901
Steam consumption of air pump	172
Total steam used per hr	12,476 lb.
Duty in million ft.-lb. per 1000 lb. of steam, corrected for moisture	117.16
Excess duty over guarantee in million ft.-lb.	2.84
Steam consumption per h.h.p. hr. of turbine and reduction gears	13.12

This entitled the contractor to a bonus of \$3,287, which was paid by the city immediately after acceptance of the machinery.

The steam turbine is of the De Laval latest design. Instead of the straight "multicellular" or pressure-stage type similar to that invented by Prof. Rateau, of Paris, which was originally adopted for the multi-stage machines, the first stage is of the "velocity" type, like a Curtis wheel; that is, there are two rows of buckets on the first wheel, with a row of stationary guide vanes between them for changing the direction of the steam. The remaining eight stages are of the pure impulse type. The 'buckets' are secured to the rims of the hydraulically-forged steel wheels by means of bulb shanks fitted into slots milled transversely to the wheels. They are drop forgings of a special alloy of nickel and copper, and each one can be removed without disturbing the others. The buckets of the velocity stage are secured by the well known dove tail method.

All the diaphragms containing the guide vanes are of cast iron and held in place by a seamless steel band. The guide vanes are of nickel bronze.

The shaft is a nickel steel forging, 6 in. in diameter, and revolves at a speed of 4725 r.p.m., which is well below its critical speed. It is supported in two bearings, 3 1/2 by 8 1/4 in., and 3 1/2 by 6 in., respectively. An adjustable marine-type thrust bearing is also provided at the governor end of the shaft.

To prevent the outward leakage of steam and the inward leakage of air, steam sealed carbon packing rings are provided. Leakage between stages is prevented by labyrinth packing.

The main governor is of the Jahn's type, mounted on a vertical shaft and driven by a worm gear from the turbine shaft. The valve is of the double-seated balanced-poppet type. Special mechanism is also furnished for changing the speed of the turbine wheel in operation. It consists of a cast-iron sleeve on which is turned a thread. This sleeve surrounds the governor spindle and there is a spring fitted inside it, and a hand wheel which operates on the thread outside. The speed is varied by increasing or decreasing the tension on the spring by screwing up or down on the hand wheel. The former lowers the speed and the latter increases it.

The machine is also equipped with a Schutte & Koertig quick-operating trip-and-throttle valve which acts in

SECTION ON LINE A-A OF PLAN SHOWING TURBINE AND MOTOR-DRIVEN PUMPS

conjunction with a safety governor mounted in the end of the main shaft, independent of the main governor. This governor is generally set to close the trip-and-throttle valve at a speed of about 10% above normal.

The double helical reduction gears have a speed reduction ratio of 5.66 to 1, the pinion operating at 4725

r.p.m.; and the gear which connects to the pumps, at 850 r.p.m. The gear loss does not exceed $1\frac{1}{2}\%$, which represents tooth and bearing friction and windage.

The pinion is an oil-tempered nickel steel forging, much harder than the gear to compensate for the higher speed. The teeth are cut directly on the shaft.

CHARACTERISTIC CURVES FOR 20-IN. 2-STAGE PUMP AT HAMILTON WATER WORKS

The gear consists of a heavy cast-iron centre on which are shrunk two heat-treated seamless rolled-steel bands, the teeth being cut on these bands. The gear centre is secured to the 6 in. open-hearth forged-steel shaft by means of a taper fit and key. The diameter of the pinion is 4.625 in., and of the gear, 25.625 in. The total width of face of gear and pinion is 20 in. The tooth pressure at full load per inch width of face is 222 lb. The teeth are cut at an angle of 45 deg.

There are three pinion bearings, two of which are $3\frac{1}{2}$ by 10 in., and one $3\frac{1}{2}$ by 14 in. The gear has two bearings, $5\frac{1}{4}$ in. by 12 in. All turbine bearings and the pinion bearings are water-cooled and equipped with sight-feed oil glasses. They are supplied with oil from a gravity system. There is a positive gear-type of pump mounted on the lower end of the governor spindle which draws its supply from a reservoir located in the gear bedplate. This pump forces the oil through a Griseom-Russell cooler into a tank placed about 16 ft. above the centre line of the machinery, from whence it descends to a filter and from there flows to the different bearings and to the reduction gears. These gears are lubricated by a spray of oil issuing from small nozzles which are secured to a manifold inside the gear case. In this manner the oil is projected against the line of contact of the teeth on the entering side. The oil flows from the pinion bearings into the wells of the gear bearings and then to the large oil reservoir in the bedplate, to which also flows the oil from the turbine bearings. Suitable screens are located in this reservoir to prevent grit, etc., from flowing to the oil-circulating pump. Thus it is seen that the oiling system is what is known as continuous circulation.

The two single-stage 18 in. double-suction pumps are similar in every respect, with the exception of size, to the motor-driven units described previously. The impellers are 27.7 in. diameter, mounted on steel shafts which are $4\frac{1}{4}$ in. at the centres. Each shaft is supported by ring-rolled bearings, 4 in. diameter by $8\frac{1}{4}$ in. long, and 3 in. diameter by $9\frac{3}{4}$ in. long, respectively, the latter being of the marine thrust type, which have four thrust collars 4 in.

in diameter. The distance from the centre line of impellers to centre line of bearings is $28\frac{1}{2}$ in.

The condenser is of the water works surface type, containing 1,300 sq. ft. of cooling surface, consisting of 742 brass tubes (1 in. O.D.). The shell is 4 ft. 8 in. in diameter. It is located immediately under the turbine, an expansion joint connecting the turbine exhaust flange to the condenser steam box flange, both of which are 20 in. diameter. With this type the steam passes through the tubes and is condensed by the water flowing to the main pumps, all of which is drawn through the condenser on the outside of the tubes. Thus the entire capacity of the main pumps passes through the condenser, the shell of which is designed of suitable area to keep the friction down to a minimum. In this particular installation it does not exceed 2 ft. The water openings are 26 in. diameter and are located opposite each other. Cast-iron piping of this same size connects the inlet end with the large well which furnishes the supply, and the outlet end is connected to the suction of the first pump by 26 in. pipe, which is reduced to 18 in. about 3 ft. from the pump suction flange. The tubes are expanded into Muntz metal header at the steam box end, and secured at the other with packed glands and screw ferrules. The steam makes two passes through the tubes.

A 6 by 14 by 10 in. horizontal crank and fly wheel, wet air or vacuum pump, manufactured by the C. H. Wheeler Co., Philadelphia, removes the air and condensation; 6 in. piping connects the condenser to the vacuum pump inlet.

The condensation flows by gravity to the vacuum cylinder, there being no suction valves. The brass liner of the cylinder has a number of ports which connect with the suction belt extending around the cylinder and connecting with the suction opening at the top of the cylinder. These ports control the suction to the pump, being automatically closed and opened by the piston passing and repassing them. The discharge valves are also special and consist of about ten spring phosphor-bronze plates grouped in units on longitudinally slotted rods in which the valves fit. The tension is controlled by means of a pawl-and-ratchet device.

Both vacuum and hot water pump exhausts are connected to a Cochrane feed-water heater, which acts as a hot well and receives the condensation from the vacuum pump. This is automatically augmented by an outside cold-water supply, and after being heated by the exhaust steam from the vacuum and boiler feed pumps, is pumped to the boiler by the vertical, double-acting 9 by 6 by 10 in. brass-fitted boiler-feed pump similar to the Weir Admiralty type, which was manufactured by the Tod-Attwood Co., Toronto.

The pump house is about 200 ft. from the pumping station, and a 6 in. steam main is laid underground and enters the wall of the basement about 6 ft. below the ground level. It is here reduced to 4 in. and a Cochrane steam separator is installed close to the turbine. All the pumps have a separate suction well, 5 ft. square. Water is conveyed to them from a tunnel situated at the back of the station and delivered through a 30 in. sluice valve and conduit.

The discharge main from each of the De Laval units is 24 in. diameter, and there are 24 in. Chapman check valves and gate valves installed in each of these mains about 20 ft. from the pumps.

All the gate valves on the discharge mains of each of the electrical pumps are controlled through a system of counter-shafting, sprockets, chains and bevel gears by a 15 h.p. Canadian Westinghouse induction motor. Friction clutches enable each valve to be operated separately.

The old basins are no longer used for filtration purposes, having been converted into sand traps. The 20 in., 30 in. and 48 in. intakes are open from the basins to the lake and deposit any sand carried through them into these basins. The 72 in. steel intake which Mr. Bain recommended in his report as being necessary, has not yet been installed. The 48 in. intake is laid 2,200 ft. from the shore line under 35 ft. of water.

Transformers are installed in a separate room leading off from that in which the pumps are installed. They consist of two 750 k.w., 3-phase Canadian General Electric from 13,200 to 2,200 volts; two 500 k.w., 3-phase Canadian Westinghouse 13,200 to 2,200 volts; and seven 400 k.w., single-phase 13,200 to 2,200 volt made by the Packard Mfg. Co., St. Catharines.

There are two reservoirs connected with the city mains from the Beach Pumping Station: (1) The Barton Reservoir, with a capacity of 11,000,000 Imp. gal.; and (2) the James St. Reservoir, with a capacity of 1½ million Imp. gal. The latter is 65 ft. higher than the Barton Reservoir and is the one generally in use, the Barton Reservoir being held in reserve. The water from the pumping station does not flow directly into these reservoirs but is pumped into the mains, and the reservoirs are used to take care of peak consumption during the day, and are filled up at night. There are two connections to the Barton Reservoir, one 18 in. and one 20 in. The James St. Reservoir is connected to the mains by a 20 in. pipe line.

There are four mains leading from the Beach station to the city, 18, 20, 30 and 36 in. respectively.

For information pertaining to general features of the Hamilton water works, the writer is greatly indebted to James Bain, who, by the way, takes keen pride in the appearance of the pumping station, which is undoubtedly one of the finest in the country and will bear comparison with the majority of those to be found in the large cities in the United States. The row of lamp standards, about 10 ft. high, down the centre of the floor—with 12 in. diameter single frosted globes—looks especially handsome.

PHILADELPHIA CONVENTION AMERICAN WATER WORKS ASSOCIATION

APRIL 25 issue of "The Canadian Engineer" contained a tentative program for the Convention of the American Water Works Association to be held at Philadelphia, May 15-19, inclusive. The final program has now been issued and our readers may be interested to know that a few changes have been made from the preliminary schedule.

Monday, May 15, will be, as usual, devoted to registration and informal get-together meetings. In the evening there will be a reception and dance in the Clover and Red Rooms of the Bellevue-Stratford Hotel. This function will be under the auspices of the American Water Works Manufacturers' Association.

Tuesday, May 16

On Tuesday, May 16, John H. Gregory will not read his paper as previously announced. In the afternoon a trip to Valley Forge has been arranged for the ladies. Special conveyances will leave the Bellevue-Stratford Hotel (Walnut St. entrance) at 1:30 p.m., returning to Philadelphia at 5:00 p.m.

Wednesday, May 17

Wednesday, May 17, the technical session will be carried out in accordance with program as previously announced. In the afternoon a boat trip to Wilmington and return has been arranged for all the delegates. That same evening the ladies are to be entertained to a theatre party.

Thursday, May 18

The program for the Thursday evening session is as follows, when the papers given below will be presented:

"Purification of Water for Industrial Uses," by S. P. Powell. Illustrated with lantern slides.

"Lime, Soda and Zeolite Water Softening," by A. S. Behrman.

"Turbo-Centrifugal Pumps," by Richard Waller. Illustrated with lantern slides.

Immediately following this session which will adjourn at 9.30, the men will attend a smoker to be held in the Bellevue-Stratford Hotel while simultaneously the ladies will be entertained by a card party on the Mezzanine floor, under the auspices of the Water Works Manufacturers' Association and in charge of the ladies entertainment committee.

The Chemical and Bacteriological Section of the Association will be held on Thursday afternoon, May 18, at which the following papers will be presented.

"Water Softening by Base Exchange," by Edward Bartow, and Gerald C. Baker.

"Standard Methods of Water Analysis," by Jack J. Hinman, Jr., Chairman.

"Colloidal Chemistry in Relation to Water Purification," by Robert Spurr Weston, Chairman.

"Testing of Waterworks Materials and Supplies," by Thaddeus Merriam, Chairman.

The Friday afternoon session of the Chemical and Bacteriological Section will be carried out in accordance with the preliminary program.

INCREASE IN PIG IRON OUTPUT

DURING the month of March the output of pig iron in Canada showed a decided increase over production during the preceding month and established a record for the present year with a total of 41,733 tons, comprising 25,974 tons of basic pig iron, 10,123 tons of foundry iron and 5,636 tons of malleable iron. With the exception of 71 tons the output of basic iron was all used by the producing firms. Foundry iron, on the other hand, was largely produced for sale, the total under this heading being 10,080 tons, with only 43 tons made for the use of the firms reporting. Compared with the preceding month the production of basic iron was only slightly higher, but the output of foundry iron was almost 2,000 tons greater than in February. Malleable iron to the extent of 5,636 tons made during March was the first produced this year.

At the close of the month there were only three furnaces in blast, two at Sault Ste. Marie and one at Hamilton, the single furnace operated by the Dominion Iron and Steel Co. in February having been closed down before the end of March.

The revival of the iron and steel industry indicated in reports from the producing centres in February gained a little strength during March, and while the number of furnaces actually in blast in Canada at the close of the month was less than at the end of February, the output in Canada was appreciably higher, and to that extent more satisfactory.

Output of steel ingots and castings during March was only 29,941 tons, as against 42,388 in the preceding month. The decline was most marked in the production of basic open hearth steel ingots, which accounted for only 28,222 tons, compared with 40,935 in February. Bessemer castings and electric steel in March amounted to a little more than 1,000 tons, a slight increase over February.

NATIONAL HIGHWAY TRAFFIC ASSOC'N. MEETING

ALL arrangements have been completed for the 1922 Annual Meeting of the National Highway Traffic Association which will be held in the Assembly Hall of the Automobile Club, New York City, on Friday, May 12. At the afternoon session reports of National Committees will be presented on "Uniform Highway Signs," "Traffic Capacity and Widths of Highways Outside Municipalities," "Status of the Construction of Highway Curves and Recommended Practice to Increase Safety to Traffic." The report of the Executive Committee on "Highway Improvement Creed" will also be presented.

At the evening session an address on "The Railroad as an Operator of Highway Transport" will be delivered by Arthur H. Blanchard, president of the Association. Reports of National Committees will be presented on "Regulations Covering Speeds, Weights and Dimensions of Motor Trucks," "License Fees and Motor Vehicle Taxation," "Highway Transport Franchises" and "Highway Transport Clearing Houses." The meeting will be concluded by the election of officers for 1922-1923.

Statistical Record of Toronto Water, 1912-22

Laboratory Observations Recorded During Ten-year Period of Purification—Relationship of Hydrogen Ion Concentration to Residual Alum—Bacterial Concentration and Seasonal Variation in Filter Efficiency, With Reference to PH Concentration and Colloidal Content—Reduction in Typhoid Fever

By NORMAN J. HOWARD

Bacteriologist-in-Charge, Toronto Filtration Plant Laboratory

IN the city of Toronto there are two municipally-owned filtration plants and three separate chlorinating systems. The history of the purification of the water supply dates back to 1910, when the city was visited by a serious typhoid epidemic and a death-rate of 40.8 per 100,000 of population was recorded. As a temporary measure, a hypochlorite plant was installed and within two months the epidemic had abated. In the following year the death-

strated over and over again, and in 1921 the net saving effected by laboratory control of applied chemicals was sufficient to pay entire maintenance costs for the laboratory for a period of three years; in addition, the frequent examination of the water permits the more scientific application of chlorine.

Nature of Laboratory Work

The extensive nature of the work carried out in the laboratory of the plant can best be indicated by the number of examinations made in the past ten years. In 1921, when the slow sand system was first put into commission, 8,096 tests were made. This figure has yearly risen, and in 1921 no less than 21,028 samples were analyzed. During the 10-year period the total number of examinations made was 136,302 and included routine, chemical, bacteriological, physical and microscopical examination of the raw, filtered and chlorinated water; examination of well supplies, sewage and ice samples; chemical analysis of alumina sulphate, alum sludge, boiler compounds and incrustations; experimental work on the corrosive action of chlorine and alumina sulphate on various metals; the sterilization of water by chlorine, potassium permanganate and other reagents; the effect of mechanical and slow sand filtered water upon the growth of algae; a study of the hydrogen ion concentration of water and its relationship to seasonal changes in the filtration process; colloidal alumina occurring in mechanically filtered water; and a large number of observations on the occurrence of taste.

Methods of Analysis

Standard methods as laid down by the American Public Health Association were used so far as possible, not so much because they were regarded as satisfactory, but for the purpose of uniformity. Chemical methods, generally speaking, were found to be satisfactory, but bacteriological

FIG. 1—TYPHOID MORTALITY, 1910-20, IN TORONTO, AND YEARLY PERCENTAGE INCREASE IN B. COLI SAMPLES POSITIVE IN 1 C.C. OF RAW LAKE ONTARIO WATER AS COMPARED WITH 1912

Prior to 1912 systematic examination of raw water had not been undertaken. Shaded columns indicate typhoid mortality.

rate was down to 20.8. As a result of the epidemic Allen Hazen was consulted in an advisory capacity, and he recommended slow sand filtration, to be followed by sterilization. The plant was commenced in 1910 and put into commission January, 1912. Within a few months from this date the demand in the city exceeded the working capacity of the plant, and as a result raw and filtered water were intermittently supplied.

For a period of two years the subject received considerable attention, and in 1914 R. C. Harris, Commissioner of Works, placed the matter before the City Council and was successful in getting the necessary appropriation for the construction of an additional plant, which was started in the spring of 1914 and taken over by the city in the summer of 1918. The new plant was of the drifting sand type, the combined capacity of the two plants being 108 million gallons, with an actual working capacity of 88 million Imperial gallons. At present that is barely sufficient to meet the continually increasing demands, and the early construction of an additional plant is under consideration by the Commissioner of Works.

The purpose of this paper is to state from a laboratory viewpoint observations recorded between the years 1912 and 1921, covering a period of ten years. During this time extensive routine and research work were undertaken. From a purification point of view, the successful operation of the plants and the daily examination of large numbers of samples have proven of considerable value to the city. The economic value of the laboratory has been demon-

1917	26,386	200	99.2

tests had to be modified, tests for B. Coli being regarded as particularly unsatisfactory. The substitution of oxgall in 1912 for lactose broth considerably decreased the number of fermenters; but it was found that practically the whole of the fermenters that did occur, confirmed out typical strains of the colon group. When comparisons were made

between lactose oxgall and lactose broth, results showed that the latter medium produced approximately 20% more fermenters, out of which at least 8% confirmed out. Neither medium has been regarded as satisfactory, lactose oxgall being too inhibitory and lactose broth too favorable for overgrowths.

The introduction of small amounts of sodium taurocholate or sodium cholate in quantities up to 0.5% has given favorable results, producing a media not too inhibitory.

TABLE 3—AVERAGE NUMBER OF BACTERIA PER C.C. GROWING ON STANDARD AGAR, 24 HOURS AT 37 DEG. C.

	Raw Water	Slow Sand Filtered Water	Percent-age Reduction
1914	103.53	3.11	96.9
1915	347.67	1.85	99.5
1916	280.00	2.90	98.9

1920	413.33	25.19	93.9
1921	566.37	26.29	95.2

ory and particularly favorable to the propagation of the colon group.

It has been frequently observed when using lactose broth for the presumptive B. Coli test no gas formed in 24-hour samples, but abundant gas formed in 48-hour tubes, which persistently failed to produce confirmatory results. When this occurred in Lake Ontario raw and filtered water, it has been said to be the result of overgrowths, but when occurring in chlorinated water was probably caused by spore-formers belonging to the sporogenes-welchii group.

It is possible that when a particular stage of gas development in the broth tube is reached, the medium becomes so acid or alkali, that bacteria belonging to the colon group are destroyed or so devitalized as to lose their reproducing properties. Certain types of alkali-forming organisms can be isolated which are able to grow in a distinctly acid medium, and it is probable that the so-called overgrowths are not the result of the predominance of alkali-forming bacteria, but rather indicates their ability to reproduce under conditions unfavorable to the colon group. In support of this theory it has been demonstrated in the laboratory that certain lactose broth cultures which had formed gas but failed to produce acid organisms on a solid medium, could be rejuvenated by frequent transplantings into broth tubes and made to reproduce typical strains of B. Coli. A study of this subject with special reference to the hydrogen ion concentration of the medium both before and after inoculation is to be undertaken in the near future. Chambers¹, when investigating the inhibitory nature of certain media in the growth of B. Coli, recently published an interesting paper on the subject, in which he states that in a 0.4% glucose broth medium, lethal acidity occurs at a p_H concentration of 4.9-5.1, the most favorable for development being 6.0-7.0; inhibition due to alkalinity begins at 7.0-7.6. Preliminary laboratory observations in Toronto would appear to confirm these opinions.

For many years complete confirmatory tests were made on all gas-formers, the classification being divided into three groupings: (1) Typical B. Coli communis; (2) B. Coli communior; (3) non-typical organisms belonging to the colon group.

¹ Chambers, W. H. Annual report Missouri Botanical Gardens, 1920.

Confirmed typical B. Coli was determined on Houston's Flaginac test² (Fl. fluorescence in Greubler's neutral red broth; Ag. acid and gas production in lactose broth; indol production in peptone broth; ac. acidity and clotting of litmus milk). In addition to this, dextrose and saccharose broth tubes were inoculated.

As the number of laboratory tests increased it was found impracticable with a limited staff to carry on the exhaustive confirmatory work, which sometimes involved 100 sub-cultures daily, and consequently the brief methods as suggested by the American Public Health Association were adopted. Confirmed B. Coli hereinafter mentioned consists of three positive reactions: (1) Formation of gas in lactose broth; (2) acid-forming colonies in litmus lactose broth or rebiplagar (neutral red, bile salt, peptose, lactose, agar); (3) sub-culture and fermentation of lactose broth. In the face of evidence to the contrary, it is not suggested that the organism isolated is typical B. Coli, but rather one belonging to the colon group.

The custom quite frequently met with in American practice of making rapid and incomplete tests for the isolation of the colon bacillus is not to be commended, too much being taken for granted. In laboratory reports one frequently finds figures relative to the presence or absence of B. Coli. Such reports would be more explicit and of greater scientific value if details of tests were published. The results could then be more intelligently interpreted.

For the enumeration of bacteria, standard gelatine and agar and Houston's rebiplagar³ were used, the first two having a + 1.2 acid reaction. The use of gelatine plates at 20 deg. C. was discontinued chiefly on account of the enormous growth of psychrophilic organisms which developed in the winter months, producing counts in excess of 100,000 per c.c., and which were of no sanitary significance. Quite often counts of 250,000 per c.c. occurred with B. Coli absent in 100 c.c. This organism was worked out in the laboratory and described by J. Race⁴ and would not grow in a temperature above 27 deg. C.

Standard agar at 37 deg. C. has always given satisfactory results. For the enumeration of intestinal bacteria Houston's rebiplagar has been found the most valuable media in use, and can be used either for enumeration purposes or confirmatory B. Coli plates, it being superior to

of the city supply is outside the jurisdiction of the filtration laboratory, this being in charge of the Directory of Laboratories of the Department of Public Health. Close co-operation has always existed, the Director being kept informed of any abnormal changes in the quality of the water prior to final treatment. The application of alumina sulphate, chlorine prior to filtration, and chlorination of the island supply during the summer months, was directly controlled by the laboratory.

In most cities alum is applied to the water for clarification purposes, but in Toronto it was originally employed on account of heavy bacterial pollution of the raw water and also at times when turbid conditions existed which periodically followed abnormal meteorological conditions. In 1921 experiments showed that chlorine could be safely substituted for alum and applied to the raw water prior to filtration through the drifting sand plant, at such times as

Increase of population in the various municipalities within a considerable distance of Toronto, many of whom discharge their sewage effluents into Lake Ontario.

In the laboratory survey of Lake Ontario, completed in 1921, it was shown that the raw water was more or less seriously polluted from Long Branch to Scarboro, a distance of approximately 16 miles, 8 miles east and west of the present location of the water works. Samples taken 1½ miles from shore in 65 ft. of water were included in the survey, and at times showed heavy pollution. This condition was forecasted in 1911 by the Board of Water Commissioners² and again in 1912 in the report of the Commissioner of Works³, and there would appear to be no reason to suppose that it will not go on increasing so long as Lake Ontario is regarded as the normal receptacle for the discharge of putrescible matter.

It is not suggested that this condition only applies to

Lake Ontario, it being a common practice throughout the American continent, in spite of many state and provincial laws prohibiting its practice. No solution would seem to be in sight for the following reasons: (1) The financial stringency; (2) the expressed desire of municipalities to withhold the spending of large sums of money on disposal works pending further development of sewage purification; (3) the cost and frequent inefficiency of the sterilization of sewage effluents.

the water was physically good. By doing this a water of satisfactory biological content, free of suspended matter, was obtained and considerable economy effected. This policy was found to be thoroughly sound and practical but it has never been used at the expense of the quality of the effluent, which consideration has always been regarded as of first importance.

The actual application of chemicals is controlled by chemical and physical analysis of the raw water, the nitrogen as ammonia test giving an accurate index as to the probable bacteriological quality of the water. Lake Ontario is subject to varying degrees of pollution, the intensity of which can be gauged by this test. Pollution at the intake is dependent upon the flow of lake currents, which are controlled by prevailing meteorological conditions.

Bacteriological Results

A study of the bacteriological figures over a period of ten years shows the pollution of Lake Ontario to have yearly increased, following the normal industrial development and

Again, modern practice in America regards the purification of the water supply as more practical and economical than the purification of sewage before its discharge into a stream⁴. Providing sewage effluents do not contain offensive chemical compounds and by-products, and the purification of the water supply involves no insurmountable difficulties, this would seem to be practical, but it would be dangerous to accept such a policy without a complete sanitary survey having been first undertaken.

The effect of the pollution in Lake Ontario upon the filters can be seen by a study of the accompanying tables, the efficiencies of the plants being slightly lower each year as the pollution has increased. In view of the fact that the

filtered water is finally treated with chlorine before consumption, this cannot be regarded as a serious matter, although in time should it become necessary to increase greatly the amount of chlorine for sterilization purposes, difficulties may occur in preventing taste during susceptible periods. At the present time the filtered water is of satisfactory quality and particularly suitable for final treatment with chlorine.

Physical Conditions

Physical examination of the raw and filtered water was made daily and proved of value in following the operation of the filters. The slow sand plant has at all times yielded an effluent clear, bright and free of turbidity. The effluent from the drifting sand plant was clear and bright, and only on rare occasions following storms of unusual severity did turbidity pass the filters. The condition of operation occurring in the drifting sand plant involves a high rate of filtration (150 million Imperial gallons per acre per day) and no sedimentation; consequently in storm periods very careful operation was found necessary to prevent the passage of turbidity through the filters.

Microscopic Examination

In the early days of the slow sand plant, microscopic examination was made daily and afforded excellent opportunities of following the loss of head occurring in the filters. Of recent years, on account of increased work, only seasonal and special examinations were made. At no time has the microscopic content interfered with the operation of the filters. Occasionally in the summer months particularly in July, August and September, slight taste occurred following the presence of volvox and uroglena. Throughout the year, especially in the early spring and fall

months, diatoms were present in considerable numbers, asterionella, fragillaria and cyclotella being the most common; generally speaking they were not in sufficient numbers to cause a taste, although after chlorination in the summer months a slight taste has periodically been noticed in the treated water. Amongst the other types frequently found in the raw water were synedra, diatoma, tabellaria, melosira, microcystis, coelosiph-aerium, unabacna, tetraspora, hydrodictyon, ulothrix, dinobryon, vorticella, codonella, and several types of rotifera, crustacea and infusoria.

Chemical

Chemical examination and general analysis involved a considerable amount of work, and, as previously stated, was of material assistance in controlling the application of chemicals, the cost of alum in 1920 amounting to \$55,000. By substituting chlorine for alum in 1921, an actual saving of \$35,000 resulted.

Complete sanitary analysis was made on the raw and filtered water and the results as recorded in tables present interesting reading. It will be observed that the chlorides have risen from 7 p.p.m. in 1912 to 10 parts in 1921, a

figure quite in harmony with the increased bacteriological content of the water. The slow sand plant gave a water somewhat purer than the effluent from the drifting sand plant.

The general reduction of the chemical figures in the filtered water was satisfactory, particularly as regards the albuminoid nitrogen and the oxygen absorbed, representing as they do a reduction in the nitrogenous and carbonaceous matter. The increase in the nitrates in the slow sand plant pointed to greater oxidation, doubtless caused by the nitrification process involved.

Alkalinity as calcium carbonate was reduced by approximately 2 p.p.m. in the drifting-sand plant, and probably in time, when the calcium and possibly magnesium carbonates normally present in the sand are used up, a greater reduction will be shown.

At no time has the theoretical reduction of 6.675 p.p.m. for each grain of applied alumina sulphate per gallon been attained. Laboratory tests on the raw water using methyl red as an indicator, have given an actual reduction of 6.2 parts for each grain per gallon, but the same water after filtration through the drifting sand plant has rarely shown a reduction of over 2 parts per million.

Dissolved oxygen was reduced by the slow sand plant, but increased after passage through the drifting sand plant. In the warm weather raw water was frequently super-saturated, the effect of this being noticed in the drifting sand plant, air pockets occasionally forming in the extractor system, particularly when a high dosage of alum was being applied.

Residual Alum

The question of residual alum in filtered water was first raised at Albany at the 37th convention of the New England Water Works Association, and arose out of a discussion on a paper presented by the writer on the operation of the drifting sand system in 1918.

At that time a strong attitude was taken by several well-known sanitarians, who claimed that the passage of alum in any form whatever pointed to a defect in the filtration system involved. The matter received considerable attention in the laboratory in 1920, and was the subject of a special paper by Howard and Hannon¹, followed by another the following year by Wolman and Hannon², the latter paper dealing entirely with the theoretical considerations involved. It seems an extraordinary fact that this question received publicity only after 20 years' operation of mechanical filters, and of recent date has been the subject of extensive investigation and controversy throughout the American continent. It is now conceded that the effluents from a majority of mechanical plants contain alum in colloidal form. Heretofore the basis of discussion was limited to a study of the alkalinity of the water, it being generally conceded that, providing an excess of alkalinity existed after treatment, no alum could pass the filters if sufficient sedimentation had been allowed.

In Toronto, laboratory experiments first demonstrated that in a water of similar chemical content, sedimentation was unnecessary for removing residual alum or securing bacteriological efficiencies, the same results being obtained in the filtered water after four minute's and four hours' sedimentation. Similar experiments were made on a colored water containing 30 p.p.m. of color and 50 parts of alkalinity. It was found that the color was reduced by filtration to 8 when using 2.25 grains per gallon of aluminum sulphate, after a contact period of 5 minutes. This latter experiment was undertaken to secure comparative in-

formation on the removal of color, special references to the question of a definite period of sedimentation being necessary.

It is not suggested that all colored waters could be so treated, but in cases where prolonged periods of sedimentation are allowed, experiments could be well undertaken to demonstrate the feasibility of reducing the time. On large plants a reduction of time in treatment is one of considerable importance, and in new works great economy could be effected if it were found practical to reduce the area of sedimentation basins.

The whole question would seem dependent upon the hydrogen ion concentration, the nature of the color, and the colloidal content of the water involved. Lake Ontario water contains no color, so this subject has no bearing upon the local treatment of the water supply. As regards residual alum experiments, we have been unable to find a water which, after treatment with aluminum sulphate with subsequent filtration, has not contained colloidal alumina. A summary of observations previously reported was as follows: (1) Effluents from all treated water examined gave positive reactions; (2) raw water from Lake Ontario and Lake Erie gave negative reactions; (3) intensity of positive reaction slowly diminished on long standing, but after six months was still perceptible; (4) freezing did not affect the reaction, neither did boiling; (5) filtered through six thicknesses of Whatman's No. 5 filter paper, the reaction was still obtained, there being evidence of adsorption of sol by the paper; (6) the sols freely ascended bihulous paper—over 13 cm. in 48 hours; (7) water of ϵ_{H} 8.0-8.6, yielding no reaction if brought into contact with alumina gels or if passed through a filter paper which had adsorbed alumina sols, will yield positive reactions; (8) Non-reacting Al in solution (normally present in Lake Ontario water) can be brought to react by slightly acidifying, boiling, cooling and restoring the original ϵ_{H} value by cautious addition of ammonium carbonate. The presence of iron may interfere with this test as Haematoxylin combines with iron in preference to alumina when both are present together in reactive form. These reactions can be accounted for if we assume:

(a) Haematoxylin enters into reaction with alumina sols but not with aluminate ion.

(b) Alumina gel is readily peptised in presence of OH-ion, even at ϵ_{H} 8.0.

(c) Alumina sols are not stable in presence of OH ion, but are converted into aluminate ions.

(d) Aluminate ions are stable in presence of OH ion, but are decomposed by acids with formation of aluminum ions.

(e) The degree of dispersion of the sols is probably greater

1—With increased O H-ion concentration.

2—After severe filtration.

(f) Higher dispersion accelerates the course of reactions.

In Toronto we have been able to demonstrate that the residual alum after filtration was a hydrate in colloidal form, which subsequently became an aluminate the exact nature of which has not been determined.

In many cities the raw water has a low hydrogen ion concentration of approximately 7, and is soft or colored. The addition of a coagulant prior to filtration still further lowers this figure, making the water slightly acid, and when the alum passes through the filter in colloidal form it becomes corrosive, combining with iron in the pipes and subsequently precipitates in the city mains, producing a highly discolored water.

By correcting the hydrogen ion figure immediately after filtration by the addition of lime, this could be prevented. The chief question involved, however, would be the advisability of treating the water prior to filtration instead of adjusting it after filtration. It should be borne in mind that the most favorable hydrogen ion concentration for filtration purposes is between 6.5 and 7.4, precipitation commencing at the first-named figure and the iso-electric point occurring approximately at the latter figure. The introduc-

tion of lime before filtration would render the water a little more difficult to treat, and also allow the passage of a greater amount of colloidal alum through the filters. It would thus appear to be a question entirely for the local chemist and engineer to decide.

The water of Lake Ontario has a hydrogen ion concentration of 8-8.4 according to season of the year, and after filtration through the drifting sand plant contains a residual alumina in colloidal form which has no corrosive properties, does not produce any after-precipitation in the mains, has shown no evidence of protecting bacteria against the sterilizing effect of chlorine, and can be said to be of no sanitary significance.

In the experimental-work carried out in the laboratory the reagents used were fresh alcoholic solutions of extract of logwood (1%), haematoxylin (0.3%) and Nx6 acetic acid.

1921	3.0	0.5	0.520

The presence of alumina was determined by the formation of a blue to purple color, which after acidification turned to pink or brown. In the absence of alumina a deep pink color resulted, which turned to yellow on addition of the acid. In all cases control tubes were found necessary on account of the extremely sensitive nature of some of the reactions.

Operation of Filters

The operation of the filters has not involved any change of a radical nature in the past few years, nor have any difficulties occurred which have not, or could not, be overcome. The chief problem encountered, which has affected the output of both plants, has been occasional storms of great violence, resulting in the precipitation of large quantities of fine sand and vegetable debris. Slow sand filters have usually been more affected on account of

the difficulty of sand cleaning, particularly in winter months, this being one of the chief considerations involved, when it was decided to extend the purification system in 1914, by the addition of the drifting sand filters. This latter system, on account of the simplicity in cleaning, is able to recover more quickly and presents certain advantages not possessed by the slow sand plant.

The operation of both plants would be greatly facilitated if a sedimentation or pre-filtration system were in existence, as practically the whole of the heavy suspended matter would be removed before the raw water entered the filters. This would however, involve double pumping and certain engineering difficulties. The custom of raking the surface of the slow sand beds has greatly prolonged the life of the filters. This practice, while being common in America, is prohibited in Europe, it having been demonstrated in London and elsewhere that it seriously impairs the bacteriological efficiency of the filters. Similar conditions have been noticed in Toronto after a series of storms which deposited heavy layers of silt on the surface of the beds and rendered frequent raking necessary in order to maintain the output of the plant. While the general efficiency of the filters was at times lowered, it was not considered a matter of importance in view of the fact that all effluents were finally sterilized with chlorine.

The problem of sand cleaning in the slow sand filters during the winter months was partly solved in 1913 by the use of portable sand washers, but during prolonged periods of unfavorable weather, difficulties are still experienced in maintaining the output of the plant. The increase in pollution of raw water during the past few years had the effect of greatly increasing the applied alumina in the mechanical plant, which was originally designed to operate on a one grain per gallon basis. The amount of alum found necessary to deal with a raw water which periodically contained in excess of 1,000 B. Coli per c.c., was 2.5 grains per gallon. This amount could be satisfactorily applied for definite periods, but its prolonged use had a clogging effect on the filters, particularly in warm weather. As a result it was found more practical and economical to adopt the policy common on many plants of clarifying the water with a moderate dose of alum, which also caused considerable bacteriological reduction, and depend upon chlorine for sterilization. During the summer of 1920 and part of 1921, by operating on this basis the output of the plant was maintained well above normal working capacity, and good water supplied during the whole period involved.

Bacterial Concentration

On a large plant such as Toronto possesses, which includes two entirely different systems of treatment, the seasonal differences in purification are of absorbing interest. The greatest bacterial concentration in Lake Ontario occurs in the summer and early fall months, when the water temperature is highest. This is the reverse of the conditions noted by Jordan¹, who, however, states that the variations in the bacterial flora have been observed from season to season which may partly be local in their significance. Houston has also observed that pollution is worse in the winter months in the rivers supplying London, and it may be that this applies to certain rivers, but not to the Great Lakes or similar bodies of water, where the pollution is largely local and is more or less controlled by meteorological conditions which control the direction and flow of the water.

The seasonal variation in the bacterial flora has been reported upon by Wells², who found that the number of B. Coli present in human feces increased enormously as the temperature rose, reaching its maximum in the month of August. Wells states that "the remarkable degree to which three independent curves are parallel cannot be at-

tributed to mere chance. It must be admitted that the seasonal distribution of B. Coli is related to the similar seasonal variation of B. Coli within the intestine." The figures during the past ten years show that in Toronto the total number of bacteria and the B. Coli content of the raw water follows the same curve as indicated by Wells.

The figures relative to the indicated number of B. Coli present in the raw water for each month of the year covering a period of 6 years were included in an article by the writer³, and showed enormous variations. Based upon the examination of 1822 samples, of which not less than 24 samples were examined each month during the years 1915-1920, the results were as follows:

INDICATED NUMBER OF B. COLI PER 1 C.C.

January	8.32	July	662.09
February, ...	7.42	August	2,126.13
March	11.01	September	690.28
April	19.13	October	23.22
May	36.07	November	96.12
June	54.34	December	191.33

In previous yearly reports it has been pointed out that the highest degree of bacterial removal occurred in the slow sand plant during the warm summer months and in the drifting sand plant in the winter months. In other words, as the pollution increases and the water warms up, the efficiency of the slow sand plant improves and is maintained; inversely the quality of the drifting sand plant goes back. Following is a study of the average bacterial count occurring each month in the raw and polluted water during 1920-1921:

SLOW SAND, 1920-1921

Average Number of Bacteria per C.C. growing on Agar at 37 deg. C.

	Raw Water	Filtered Water
January	610.7	6.77
February	474.25	4.89
March	337.03	3.63
April	368.84	4.32
May	554.67	2.87
June	779.26	2.98
July	1,893.62	1.87
August	1,644.62	3.22
September	1,525.22	2.76
October	885.91	4.64
November	912.58	4.19
December	598.74	4.48

At periods during the past two years the mechanical plant has been operated largely on a clarification basis and also with chlorine, consequently the filtered water figures are of little value in making a deduction as to efficiency and are not given. As previously stated, the raw water, even allowing for increased pollution, requires considerably more applied alum in the summer months to produce bacterial efficiency. During these periods B. Coli appears to pass through the filters more freely than other types of bacteria, a condition frequently recorded on other plants.

Wolman and Hannon⁴ have suggested that the seasonal variations in bacterial efficiency are probably controlled by the hydrogen ion concentration and the temperature of the water. Their paper includes figures, and a discussion on both slow and rapid sand filtration, and says in part:

"If the data presented above are valid, what effect may we be led to expect in such processes as sand filtration from season to season? Theory would certainly indicate that it should be more difficult to get good results from our filters in the warmer months when the p_H is higher. In actual practice this is frequently the case, but it is sometimes ascribed to 'colloidal difficulties.'"

¹Howard, N. J. Relation of raw water to endemic typhoid fever. "Canadian Engineer," Vol. 40, No. 3, 1921.

²Wolman, A., and Hannon, F. Further observations on p_H in natural waters. Chemical and Metallurgical Engineering, Vol. 25, No. 11, 1921.

³Jordan, H. E. Fifteen years' filtration practice in Indianapolis. Proceedings of the 13th Annual Convention of the Indiana Sanitary and Water Supply Association.

⁴Wells, W. Firth. Seasonal variation in multiplication rate of micro-organisms within the body. American Journal of Public Health, Vol. 11, No. 7, 1921.

Later they state: "Evidence confirmatory of the hypothesis that efficiency of filtration and coagulation processes vary inversely with r_n is given by the data presented in an excellent paper by Jordan. The latter clearly points out that filtration, taken as a whole, falls off in effectiveness as the temperature rises, a phenomenon which Jordan associates with biological activity."

Experience has indicated in Toronto that their opinions, as judged by results obtained from the mechanical plant, are worthy of consideration, but there has been little or no indication that the r_n controls the purification of the slow sand filtered water in either summer or winter months, and the basis of their conclusions in this respect is not apparent. To the writer it seems likely that problems frequently encountered in water purification are largely controlled by local conditions.

Is it not possible that of recent date too much has been attributed to the r_n concentration, and not enough to

TABLE 8—AVERAGE AMOUNT OF ALUMINUM SULPHATE ACTUALLY APPLIED

1918	1.027 grains per Imp. gal.
1919	1.254 grains per Imp. gal.
1920	1.225 grains per Imp. gal.
1921	1.298 grains per Imp. gal.

the 'colloidal' properties of the water involved? In dealing with water problems in general, from a colloidal viewpoint, the recent paper by Pirnie¹ is very enlightening and certainly calls for further investigation in the study of this comparatively unknown subject. Granted that physical and colloidal chemistry is very closely allied, and that the r_n concentration does actually control the situation in certain types of water. The writer is of the opinion that in dealing with a water similar in character to the raw water in Toronto, the solution to coagulation and the resultant purification rests more in the field of colloids than in a study of the r_n concentration of the water. This opinion is based upon the facts that the hydrogen ion concentration of the water is approximately 8 in the winter months and 8-8.4 in the summer months, and there is no definite indication that this small variation in the hydroxyl ions is sufficient to account for the marked seasonal variation in filter efficiency.

On the other hand, the bacterial concentration is the highest during the months that difficulties are experienced in maintaining the efficiency of the drifting sand plant, and it is an established fact that this pollution is due to sewage of recent origin. The differences in the colloidal content of sewage under warm and cold weather conditions are too well known to dwell upon, and it seems reasonable to assume that the organic content of the raw water varies from day to day. In addition to the changes in the organic content, similar changes occur in the organic colloids, and these by virtue of their varying degree of absorption might have much to do with the seasonal changes noted.

The organic colloids found in sewage carry negative charges and are highly complex and unstable. When the biological content of the raw water is high, it is apparent that the presence of enormous numbers of negatively charged colloidal molecules would require an increased quantity of alumina, which is said to be positively charged, if an effluent of bacterial purity is to be attained. An excess of alumina would increase the positive charges present and tend to re-establish electrical equilibrium.

It should be observed here Wolman and Hannan state: "It is believed that alumina used for mechanical filtration is negative when the r_n of the solution is greater than 7.5 (Sorensen's scale)." If their contention is correct, the above-mentioned suppositions are open to criticism.

The slow sand plant has always given an effluent of higher purity during the summer months, when the raw

water is most heavily polluted and the water temperature much higher. The porosity of the filters is greater in the winter months, the length of filter runs ranging from between 10 and 60 days, according to physical conditions, while in the summer months 10 days is about the maximum.

Biological activity would seem to control slow sand purification, the nitrification process being accelerated in the summer months when the water is warm and contains considerable numbers of microscopic organisms, particularly by algae, zoogloea and diatoms. Algae are rarely present in the winter months, but diatoms show a considerable increase at certain times. Both these types of organisms play an important part, and by splitting up CO_2 to obtain carbon, they liberate nascent oxygen, which has a marked germicidal effect on low forms of bacterial life.

The cause of seasonal variation in the efficiency of plants is still a matter of conjecture, and doubtless when the study of physical and colloidal chemistry has further developed, a solution will be forthcoming. The suggestion at the present time that waters in general can be definitely treated on a r_n or colloidal basis would seem to the writer to be very doubtful.

Chlorination of Water

Chlorination of the water has presented but few difficulties and has been continually carried out in Toronto since March, 1910. As in all other cities where the treatment has been effectively controlled, typhoid fever has been mastered and the mortality rate rendered practically negligible. Certain conditions in chlorination have been observed, chiefly that smaller doses are required in winter months, the dose varying from approximately 0.2 in cold weather to 0.375 p.p.m. in warm weather. Treated water examined in 100 c.c. shows almost complete sterilization in the winter months, while in the summer occasional 48-hour fermenters occur which persistently fail to confirm out or even to reproduce on a solid medium.

The question as to the relationship of spore-formers (more frequently present in the summer months in Toronto raw water) to this condition is receiving considerable attention in the laboratory. Chief among the problems en-

TABLE 9—TEMPERATURE OF RAW WATER AT INTAKE, SHOWING MAXIMUM, MINIMUM AND AVERAGE FIGURES

	Maximum	Minimum	Average
1912	62.6	32.05	41.5

1921	71.0	33.00	44.6

countered is the prevention of taste, which periodically develops under conditions quite often showing no similarity.

Examination of the city sewage containing industrial waste has indicated the presence of phenols, and it has been assumed that this is the chief condition involved. Taste does not usually occur in the summer months, it being more pronounced in the spring and early fall months. It seems highly probable that if the cause originates from the industrial wastes in the sewage, the non-occurrence of taste in the summer months is due to greater biological activity, which of recent date, particularly at Milwaukee² has been shown to prevent taste even when sewage originally contained phenols in large quantities. The cause of taste has been under investigation for many years in Toronto, but to date (apart from the phenol theory) no definite cause has been established.

Reduction of Typhoid Fever

As has been previously stated, following the treatment of the water a remarkable decline in the typhoid rate occurred, and a further pronounced drop following the enforced pasteurization of the milk supply.

Toronto's Gross Typhoid Mortality Rate Per 100,000 of Population

1910* 40.8	1914 7.5	1918 3.1

*Raw water chlorinated following epidemic.

†Raw water partly filtered and chlorinated.

‡City by-law enforcing pasteurization of milk became effective.

§Military camp in Toronto, where several cases developed and which were scored against city.

A point of very great interest is that while the pollution of the raw water has increased abnormally for the past ten years, yet the curve of typhoid mortality has yearly declined. A graph prepared by the writer in 1921 is reproduced herewith as Fig. 1.

It is obvious from this that had the water not been effectively treated, typhoid fever, instead of having become endemic, would have become an increasingly epidemic disease. To the combined results of filtration and chlorination must be largely ascribed the practical elimination of typhoid fever within the city of Toronto. In 1910, prior to treatment of the water being undertaken, a mortality rate of 40.8 per 100,000 of population was recorded, and in

1912 the rate had declined to 3.0, a striking testimony of the efficacy of filtration and sterilization of the water supply.

The writer is desirous of placing on record appreciation of the many laboratory reports dealing with water works operation, which have been received during recent years. In particular the reports of Sir A. C. Houston, published by the Metropolitan Water Board, London, England, have proved of material use in dealing with problems frequently encountered on the works and in the laboratory.

Good progress is being made in connection with the work of developing power at Sturgeon Falls on the Mattagami River. This development will be completed early in December at the present rate of progress, and is intended to preclude any possibility of the gold mines of the Porcupine field being short of power during the coming winter.

On Tuesday morning, May 9, at the Spring Meeting of The American Society of Mechanical Engineers a public hearing was arranged for the discussion of the three additional power test codes which have reached this stage of their development during the past year. Last May at Chicago this Committee, of which Fred R. Low is chairman, presented codes on general instructions, steam engines, and evaporating apparatus. It now presents codes on definitions and values, displacement compressors and blowers, and hydraulic power plants. These codes have passed through six successive revisions in reaching their present form.

STERILIZATION OF SWIMMING-POOL SUPPLIES

By J. Van Benschoten

Of Wallace & Tiernan, Ltd., Toronto.

PROPER disinfection of swimming-pool supplies is now being recognized as of paramount importance, because all swimming pools are mediums for the transmission of diseases such as typhoid fever, dysentery, eye and ear infections, and venereal diseases.

The operation of swimming pools can be divided into two classes, namely the "fill-and-draw" system and the "recirculating" system. In either case, sterilization is indispensable.

With the "fill-and-draw" system, the pool is filled and emptied at intervals, the time depending principally on the size of the pool, the number of bathers, the class of patronage and the care taken in enforcing showers and general sanitary conditions. However each bather is subject to pollution from previous bathers. This system can be modified so that a continuous incoming and outgoing supply of water gradually changes the entire supply. If this incoming water supply is properly sterilized, good results are obtained.

With the "recirculating" system, the pool is continuously recirculated, filtered and sterilized; particles in suspension and impurities are thus removed and the water kept in good condition. As filtration and sterilization are both used, the water is not only kept clean and sparkling, but all germ life killed. Where the supply is pumped from the pool through filters, then sterilized, heated and returned to the pool, the pumps and filters should be of sufficient capacity to take care of the pool content every eight to ten hours. This latter time period varies proportionately with the patronage, etc., as in the previously explained system.

Returning again to the "fill-and-draw" system and looking at it from a financial point of view, every gallon of water added to the pool must not only in most cases be paid for but, in addition, it must be heated from the incoming temperature to approximately 76 deg. F. A fair price for water is 15c. per thousand gallons, and for coal, \$15 a ton; hence if a 50,000-gal. pool is emptied weekly, the yearly cost should approximate some \$2,000.

Where pools adopt the "fill-and-draw" system and refill every 24 hours, they may pass a sanitary inspection, but where the water supply is held for a greater length of time, it is necessary to resort to sterilization. Taking everything into consideration, this method is extremely costly to operate even with continuous dilution, and more especially is this the case when the water has both to be purchased and heated.

In the "recirculating" system, the same water is pumped, filtered and sterilized continuously, and the sanitary standard maintained at all times. The water supplies of pools adopting this method have only to be changed after long intervals, as the filters keep the water clean and sparkling continuously, while the sterilizing agent kills the germ life. From a sanitary point of view, therefore, the water is always safe.

Liquid chlorine is the most efficient, as well as the least expensive, water sterilizing agent. It is effective on turbid water and hence, should the filters at any time become inoperative, sterilization can still be depended on to safeguard the supply. In view of the fact that liquid chlorine is today recognized as the proper sterilizing agent for municipal water supplies, is this not sufficient argument in favor of its use for swimming pools?

There are apparently only two other sterilizing systems which have been used to any extent for this purpose, namely, "ultra-violet-ray" and the "ozone."

"Ultra-violet-ray" is not effective on water supplies where turbidity or color are present, as any suspended matter prevents penetration of the rays. Should the recirculating and filtering equipment fail at any time, this system of sterilization immediately becomes worthless. Sterilization only takes place within the apparatus and has no effect on the water in the pool; another disadvantage is that the cost of equipment and operation are extremely high.

"Ozone" has the same disadvantage as to cost and has not proved itself particularly applicable to swimming pool supplies here.

In the chlorination of swimming pools, only a minute quantity of chlorine is necessary to destroy the life of the existing bacteria, the average dose being from five to ten pounds per million gallons of water. There are no tastes, odors or other unpleasant features, while the chemical and physical qualities of the water are left unaltered. Last, but not least, chlorination is effective throughout the entire pool.

The California State Department of Health consider swimming pool disinfection an absolute necessity, and liquid chlorine the most effective agent for this purpose.

MUNICIPAL LEAGUE MEETS AT FORT WILLIAM

AT the annual convention of the Municipal League held at Fort William, Ont., on April 27, the delegates were welcomed by President Thomas Hughes, who in his address stated that as the years went on district roads were becoming steadily better and such improvement, he believed, was largely due to the work of the League and to the splendid co-operation which existed between the members of the league and the government roads department. He advocated action to induce the government to take over the care of the main trunk roads in the district.

J. C. Meader, resident engineer in charge of the road work being done in the district by the Northern Development branch of the Government, spoke upon road conditions. He pointed out that the Government had not yet announced its 1922 road program, but he had reason to believe that the Government was prepared to carry the entire upkeep of certain trunk roads, including the following: Dawson road, Nipigon road, Scott highway, Oliver road and Arthur street road.

TYPICAL SWIMMING POOL RECIRCULATION SYSTEM

IMPORTANCE OF SURFACE FINISH ON ROADS*

Effect of Impact — Causes and Remedies for Surface Irregularities — Longitudinal Joints Increase Strength of Road — Maintenance of Good Surface Finish

By H. Eltinge Breed,
Consulting Engineer, New York City.

WE KNOW that impact is one of the principal causes of destruction of our pavements. If the wheels of vehicles are smooth and the pavement surface is smooth there is no damaging impact from traffic. The road stands up even though it be weak in proportion to the volume and weight of traffic it must carry. But let surface irregularities develop, and no matter how strongly built, the whole pavement soon shows the effects of wear. We build our roads on an average to withstand a pressure of 800 pounds per lineal inch width of tire. Yet, if an unevenness in surface of only $\frac{1}{4}$ in. occurs, the impact of one road wheel of a 5-ton truck may exert an impact pressure upon the road of 20,000 lb. Under pressure, the unevenness becomes a depression and the edges spall and break, causing holes and so on until the pavement is badly damaged.

In order to lessen impact we must build and maintain smooth surfaces. How can it be done? Close scrutiny of work and infinite attention to detail are essential. Then there are certain general remedies suggested by the general causes of unevenness, specific remedies being tried by different states or on different jobs, and different methods of work and machinery.

Causes of Uneven Surfaces

There are five general causes of uneven pavement surfaces:

1. Foreign materials in the aggregate, which, failing to amalgamate, are pushed out, leaving holes and depressions.
2. Non-uniform aggregates, which cause non-uniform wearing resistance of traffic, and subsequent depressions in the weaker places.
3. Poor workmanship in striking off and finishing.
4. Cracks, longitudinal and transverse, due to frost action, changes of temperature or unequal bearing power in the subsoil.
5. Uneven joints, perhaps the most common cause of surface trouble, due often to the piling up of joint material or to difference in elevation of slab surface.

The general remedies for surface unevenness are as obvious as the unevenness itself, and therefore, perhaps, as often neglected, they are specifications exacting good material and good workmanship. More and more we are getting these on paper, but the problem is their application to the job, because that is where the human element enters. How solve the personal equation between engineer and contractor? The answer is at once made that the relationship should be one of co-operation and mutual endeavor toward a common end, the best possible road. But as long as the idea of profit precedes social welfare as an aim in our economic life, just so long are we often going to have the contractor trying to get all he can out of a job, while the engineer is trying to make him put all he can into it. So sometimes the letter of the specification is violated, and frequently the spirit. When all engineers know their job so well that they can show contractors easier and better methods of doing their work, and when all contractors regard highway work as a legitimate industry and not a financial gamble, then we shall have that adherence to specifications that will insure good work and smooth surface.

Preserving Surface Finish

Three other general methods of preserving good surface finish, once it is obtained, are the use of steel reinforcement, the division of the road longitudinally, and the wider spacing of joints with the use of dowels.

*Paper read at the American Road Builders' Convention, Chicago.

Steel reinforcement gives the road greater bearing power and greater resistance to frost action, and it also offsets irregularities and weaknesses in the sub-soil. By helping to preserve the integrity of the pavement, it minimizes any tendency towards cracking, which is of course one cause of surface unevenness.

The division of the road longitudinally increases its beam strength about four-fold. Observation reveals that longitudinal cracks are not found in slabs 9 and 10 ft. wide, though we have all encountered them in slabs beyond that width. The reason for this difference is still conjectural, but until it is ascertained we would do well to be guided by results hitherto obtained, and build our concrete roads in two longitudinal sections.

Transverse joints being a prolific source of trouble, it is well to diminish their number as far as possible through the use of the longer slab. This wider spacing of joints becomes feasible through the use of steel reinforcement to meet the temperature stresses of the slab. The use of dowels gives stability to the joints and holds the surface even. The submergence of joints one inch below the surface has proven unsatisfactory. Devised at first to secure a smooth surface and permit the use of a finishing machine, it seemed admirable until subsequent expansion crowded and crushed the concrete above the joint material, leaving a badly ravelled and spalled joint. The best method that I have found of making a joint is to submerge the joint material until after the screed or finishing machine has passed over it; then to lift the joint material slightly above the surface with long fingered tongs; then to finish the joint with the split float or split roller, rounding the concrete next to the joint material with an edging tool.

Specific application of these general principles is found in the requirements of such states as Delaware, Pennsylvania, and New York. In these states, and in others, the specifications exact good workmanship by allowing a maximum of only $\frac{1}{4}$ -in. depression in 10 ft. of pavement tested with a straight edge. The use of the straight edge on green concrete reveals depressions that must be rectified to insure good results. These states specify materials with such exactness so as to preclude the use of foreign materials in the aggregate and also of non-uniform aggregates. They design the roads so as to minimize the danger of movement in the slab and resulting cracks, and they give special attention to the placing of joints and to the suitability of the machinery in use.

All these precautions were taken on the road built last summer in Old Bennington, Vt., by the Fred T. Ley Co., and so far not the slightest indication of any surface unevenness has appeared on it. This tends to support the writer's belief that we shall be able to build roads within necessary financial limits that under the traffic permitted by law, will be practically indestructible.

Method of Surface Finishing

The actual method of finishing is of course important in securing a smooth surface. Some road builders prefer to use the finishing machine with the roller and belt. It is essential that the roller be light. A too heavy roller pushes the crown out of the pavement, and spoils the surface. Most specifications call for a weight of from 12 to 15 lb. per foot length. Some builders omit the roller, using only the machine. The writer's experience is that the roller helps. One advantage of the finishing machine is that a dryer concrete can be used with it, which gives greater strength to the pavement. It also gives more uniform results than can be obtained with a green gang, and seems in general more fool-proof than the hand method. Still, many prefer to strike off with the hand screed, using the roller and belt. This has the advantage of making one piece of plant the less to get out of order and where a heavy screed is used in the hands of competent workmen it gives as smooth a finish as the finishing machine.

With either method the board belt gives unquestionably the best finish. The bow belt, however, can give good results. Proper belting takes off not only the water, but also the clay loam, ballance, etc., that tend to form scale on the surface.

SEWERAGE AND SEWAGE TREATMENT

Reviewed by

Dr. George G. Nasmith,
of Gore, Nasmith & Storrie,
Consulting Engineers, Toronto

SEWERAGE AND SEWAGE TREATMENT—By Harold E. Babbitt, M.S., Assistant Professor, Municipal and Sanitary Engineering, University of Illinois; Associate Member American Society of Civil Engineers. New York: John Wiley & Sons, Inc.; London: Chapman & Hall, Ltd. First edition, 531 pages, 6 by 9 in., 186 figures. Cloth: \$5.00 postpaid.

This book, as stated in the preface, is a development of class room and lecture notes. The first twelve chapters relate to design, including pumps and pumping stations; specifications and contract and the usual necessary hydraulics of sewers and details of construction. The general principles of design, construction costs and maintenance are covered in a concise and readable manner. The rational method of determining the flow into storm sewers is dealt with in an interesting way and is compared with other well-known flow formulae such as McMath's from which the results do not greatly differ. The extent and intensity of storms is also treated with sufficient clearness.

In the hydraulics of sewers, prominence is given to Kutter's formulae which is essential from the student's standpoint. In the office, however, it is much simpler to rely upon tables such as Williams & Hazen which in the hands of an experienced person are preferable.

The last nine chapters deal with the composition and properties of sewage, methods of treatment including dilution, screening, sedimentation, septicization, oxidation, activated sludge, chemical precipitation, and disinfection.

Naturally in a book of this size, discrimination must be shown in the selection of material. The writer does not desire to be critical but believes that text books which devote more space to the chemical and biological principles involved in sewage disposal and a clear description of what each method of sewage disposal, is capable of accomplishing under different circumstances would accomplish much more in bringing up an intelligent body of sanitary engineers than books which stress mere empirical methods and formulae, necessary as these undoubtedly are. The student needs to know the 'why' as much, if not more, than the 'how'. If engineers and operators possessed a clearer conception of the nature of sewage disposal processes and their limitations, together with an exact knowledge of what they desired to accomplish, there would be fewer failures of sewage disposal works.

Dunbar's book on sewage disposal covered the field of sewage disposal in a way that has unfortunately been unequalled since his day. He clearly understood what went on in every biological sewage disposal process; he would never have failed as Babbitt has to clearly distinguish, for example, the radical difference between ordinary septic action and that decomposition or digestion which goes on in deep tanks as described by Watson at Birmingham.

There are some notable omissions in the book. The inoffensive digestion of sludge by Watson is a notable development which receives no space. Nor is any reference made to the development of the brush trickling filter in Toronto, though for seven years in North Toronto that material has permitted of the treatment of six million gallons of settled sewage per acre per day as against two million gallons on the stone medium formerly used.

In fact, too little space is devoted to the trickling filter, which has by no means lost its place as a valuable method under certain conditions, though enthusiastic advocates of the activated sludge process would have us be-

lieve it had. Nor is sufficient space devoted to dilution which must come into each and every sewage disposal scheme.

With the exception of the space devoted to activated sludge one would not gather that the art of sewage disposal was largely if not altogether a British product. One has only to name the septic tank, the contact bed, the trickling filter, the activated sludge process, the Travis tank,—predecessor of the Imhoff tank,—the new mechanical aeration process and sludge digestion to realize that every great step in the art has been made in Britain. Yet of the illustrations used in the book few are those of well known classic examples either in Great Britain or even the United States.

The chapter on sludge disposal, the most difficult problem in connection with sewage, is much too short. It is interesting to note that the sludge press, which has been in operation for thirty years, still holds its own as the best method for mechanically drying sludge;—and it seems crude.

The book is well illustrated with excellent cuts and the author has been fairly successful in carrying out his intention as described in the preface. To the writer the book seems to contain that academic quality so frequently met with in books written by University teachers, namely, an impression that they have been studying the problem from a distance, and it does not possess that elusive atmosphere of authority which sometimes finds its way into a book written by the man who has been on the job, who has built, experimented and ruminated over his results and who from long observation and experience knows his subject.

ENTROPY AS A TANGIBLE CONCEPTION—An elementary treatise on the physical aspects of heat, entropy and thermal inertia for designers, students and engineers and particularly for users of steam and steam charts by S. G. Wheeler, Eng. Lieut.-Commander, R. N. Published by the D. Van Nostrand Co., New York. First edition: 76 pages; illustrated: 5 1/2 by 8 1/2 ins.; cloth. \$3.00.

CALGARY ENGINEERS MAKE PRESENTATION TO SECRETARY

AT the monthly meeting of the Calgary branch of the Engineering Institute of Canada, held on April 28, a wrist watch was presented to A. L. Ford of the Water-powers Branch of the Department of the Interior, who has been Secretary of the local branch for the past two years. A splendid turn-out of members was present at the meeting, indicating the high esteem in which Mr. Ford is held. In making the presentation P. J. Jennings, chairman of the Calgary branch, referred to the manner in which the activities of the branch had been extended during the past two or three years, attributing a great deal of the success to the efforts of Mr. Ford. Mr. Ford is succeeded in the important position of Secretary by J. A. Spreckley of the Reclamation Service. An interesting paper was read at the meeting by W. H. Snelson, agricultural engineer of the Reclamation Service, describing the experiments conducted at Brooks, Alta., by the Dominion Government, for the purpose of determining the correct duty of water which should be applied by irrigation to the various kinds of crops in Alberta. The paper was illustrated by five charts, showing the results actually obtained during the past four years. Mr. Snelson emphasized the important effect of fertility due to rotation, on the amount of water required to produce the same crop result. He also explained the method of ascertaining the depth of water actually used as distinguished from the depth of precipitation and irrigation applied in one season. This correction is made by determining moisture content of the soil to a depth of 6 ft. at the beginning and the end of the plowing season. An interesting discussion took place at the close led by John Haddin.

WATER WORKS PROGRESS

THERE is strong probability that the 42nd annual meeting of the American Water Works Association, which will be held next week at Philadelphia, will be attended by the largest aggregation in history of sanitary experts dealing with the purification of water supplies. The program has been prepared to include papers upon every branch of sanitary engineering.

Every municipality and water company should make an effort to be represented at this meeting. At these gatherings the discussions and exchange of opinion upon the numerous problems encountered, has frequently resulted in increased efficiency and economy in plant operation and maintenance.

During the past twenty years rapid advances have been made in water purification, the economic value of which is seldom fully realized by the general public. A few years ago the quality of water in several large cities in the United States and Canada was regarded as so unsatisfactory that tourists, when coming from Europe, were often advised not to go to certain cities, or, if they did, not to drink the water unless it were boiled. The advent of filtration and sterilization, with a subsequent decline amounting almost to elimination of typhoid fever, has completely altered these conditions—so much so that Prof. Winslow, when speaking recently before the American Society of Civil Engineers, stated that "there is glory enough for all in the fact that at last typhoid statistics of the United States can be compared with those in Europe without the sensation of humiliation."

One condition that must be regarded as highly unsatisfactory, and which exists throughout the American continent, is the reckless discharge of untreated sewage into rivers and streams from which public supplies are drawn. Many state and provincial laws exist prohibiting this practice, but no attempt is made to enforce such acts; consequently it must be assumed that those responsible for enforcing the observance of the law are in sympathy with the offending parties or else feel that they are powerless to uphold the law.

The practice of sewage disposal by dilution in rivers and lakes is supported by many engineers who claim it to be more practical and economical than the purification, by artificial means, of both sewage and water supply, the purification of the latter being regarded as a basic and essential condition.

When the water supply is not polluted by the industrial wastes which are said to combine with the chlorine used for the sterilization of water, producing tastes and odors, such practice may be permissible, but it can surely never be regarded as satisfactory.

The technical papers to be presented at Philadelphia include able discussions of many problems recently encountered in operation, and special attention is being given to the prevention of tastes and odors in treated waters. In connection with this particular problem, many of our Canadian municipalities would do well to investigate this subject and to try to eradicate the offensive tastes which periodically develop. From the valuable article by Norman J. Howard which appears in this issue, it will be seen that the city of Toronto has undertaken exhaustive and seemingly effective research. In the "Fourth Report on Progress of Applied Science During 1919," the work carried out in the Toronto laboratory received special mention, testifying to the efficiency of the laboratory and to the enterprise of the city of Toronto in maintaining it. The remarkable decline in typhoid fever in Toronto is further proof of the efficiency of water purification.

MEETING THE FIRE WASTE

RECENT statistics indicate that the appalling loss of property and life through fire continues both in Canada and the United States. In 1921 the fire loss of Ontario was \$13,819,953 or more than two million dollars in excess of that for 1920. There were in all 9,698 fires, or an increase of 392 for the year. For the whole of Canada the fire loss for 1921 was \$45,015,930 and the per capita loss was \$5.22, as compared with \$3.24 in 1920. For the same year the loss in Great Britain was \$36,400,000. In the last fifty years the total cost to Canada of fires, the upkeep of fire-fighting apparatus and the excess of fire insurance premiums over claims has been over \$700,000,000. This does not include the loss from forest fires, which has been variously estimated as from eight to fifteen million dollars annually.

The National Board of Fire Underwriters in summarizing recently the fire loss situation in the United States, points out that there has been a loss of property in that country through fire, averaging \$334,000,000 annually for the five years from 1916 to 1920. The regrettable part of this finding is that in the opinion of the Board no less than \$856,000,000, or 67% of the aggregate loss for the five-year period, was strictly or partly preventable.

Fire prevention officials in Canada estimate that quite as large a percentage of the fire loss as that named above is preventable in Canada. The loss for 1921 in Ontario is said to have been 80% preventable. When it is considered that many thousands of people are rendered homeless by the widespread carelessness with respect to fire and that the shortage of dwellings is thereby increased, the necessity for action is obvious. If there be added to this loss the incalculable value of the loss of several hundred human lives in the last five years, the argument for concerted and vigorous action is irresistible.

PERSONALS

J. C. GARDNER, of Niagara Falls, Ont., has been appointed road engineer for Welland County.

WALTER J. FRANCIS, consulting engineer of Montreal, has been appointed engineer to the Ontario Hydro-Electric Inquiry Commission.

JAMES A. BELL, of St. Thomas, Ont., engineer for Elgin County, has returned home after a three months' vacation at Biloxi, Miss., and other points along the Gulf of Mexico.

GABRIEL HENRY, chief inspector of the Ontario Provincial Roads Department, has been appointed superintendent of the service of maintenance and improvement of roads.

LIEUT.-COL. H. C. BOYDEN, a member of the engineering staff of the Portland Cement Association, has completed a lecture tour of Canada. Col. Boyden visited the West, and while in the East, lectured at Montreal and Ottawa.

A. W. SWAN, assistant general secretary of the Engineering Institute of Canada, Montreal, has resigned and has sailed for England, where he intends to reside permanently. Mr. Swan came from England several years ago, and after a course at the University of Toronto he entered the employ of the Canadian Ingersoll-Rand Co., at Sherbrooke, Que. He left that position in 1918 to assume charge of editorial work on the Transactions and Journal of the Institute.

GEORGE HOGARTH, who was elected president of the Association of Ontario Land Surveyors at the last annual meeting, is a native of the Province of Ontario and a graduate of the University of Toronto, class of 1909. After a brief experience in railway work, Mr. Hogarth joined the staff of the Ontario Department of Public Works in 1910 as assistant engineer, and for the following six years he was engaged in design and construction work on the Magnetawan Lock, the Winnipeg River Bridge and other important undertakings of the Department. In 1916 he was promoted to the position of chief engineer of the Ontario Department of Public Highways, which position he now holds. Much of the excellent highway construction and maintenance throughout Ontario during the past six years has been due to Mr. Hogarth.

OBITUARIES

GEORGE P. STIRLING, retired contractor, died in Winnipeg, recently, aged 82. Mr. Stirling was born in Galashiels, Scotland, and settled in Winnipeg 50 years ago where he ultimately became a building contractor and constructed a number of important buildings.

WILLIAM AINLAY, contractor, died at his home in Toronto, on April 26, aged 75. The deceased originally came from Brussels, Ont., but had been residing in Toronto about 18 years.

MAJOR HAROLD J. MACKENZIE, of Woodstock, Ont., died at St. Michael's Hospital, Toronto, on April 25.

Major Mackenzie was born at Woodstock 30 years ago and graduated with honors from the School of Practical Science, Toronto, in 1914, as a mining engineer. At the outbreak of war he was connected with the Phelps Dodge Corporation, New York, City, but left this concern in 1915 to enlist in the Canadian Engineers, later transferring to the Royal Engineers.

FREDERICK G. TWITCHELL died in Hamilton recently. The deceased was engaged in road construction work most of his life in Arizona and Mexico, and resided in Hamilton for a few years, during which time he was employed in the construction of the Brantford & Hamilton electric line. He served with the American forces in France during the war, where he contracted scarlet fever, from the effects of which he never fully recovered.

Letter to the Editor

LIBRARIES FOR RESEARCH WORKERS

Sir:—The letter of A. S. L. Barnes in your issue of March 7, page 294, brings before us some very important, interesting suggestions. He proposes that a combined catalogue be prepared and kept at some central location accessible to all, comprising all the technical and scientific books and magazines that are located in the various public and private libraries in Toronto; and, if possible, a copy of this index in each individual library.

I am heartily in favor of this suggestion together with the other suggestions of Mr. Barnes. Some co-operation exists now between some of our private libraries, but not nearly as much as should be. With a co-operative plan in operation it would save expense and duplication of books. But the greatest benefit would be the saving of time in research and investigation. Usually, when we want information, it must be produced quickly within a few hours, or it is of no use. There is also a great advantage in being able to get the advice and help of a number of librarians and statisticians in working on the same problem to produce results quickly; this method is being carried out now to some extent in Toronto.

Dr. Locke and his associates in the Toronto Public Library have had plans prepared for a long time for an Applied Science Reference Department, and have been waiting for an extension to the College Street building to carry out these plans.

I believe the Toronto Public Reference Library is the logical place to have the "co-operative catalog" of technical and scientific books, and magazines of all the libraries in the city. The library staff are willing to help us if we help them. Someone should call a meeting of representatives of the private libraries in the city to meet with Dr. Locke to work out a co-operative scheme and to start something on a small scale at first.

I am also glad to see the letter of G. W. Lee, Librarian, Stone and Webster, Inc. in your issue of March 28, page 355, on this subject. We thank him heartily for his suggestions and co-operation.

I hope to see this movement under way as soon as possible, and shall be pleased to help in any way.

Yours truly,

HERBERT C. POWELL,

Statistician, Toronto Hydro-Electric System.
Toronto, April 29, 1922.

Before the Ottawa branch of the Engineering Institute of Canada recently, H. G. Acres, hydraulic engineer for the Hydro-Electric Power Commission of Ontario, gave an interesting address on the construction of the Chippawa-Queenston canal and power plant at Queenston. The lecture was illustrated by means of lantern slides and motion pictures. K. M. Cameron, chairman of the Ottawa branch presided.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand or proposed, contracts awarded, changes in staffs, etc.

TENDERS PENDING

The following tabulation is presented as a reminder to contractors in regard to tenders that are still pending, other than those reported in this issue. The word "Issue" refers to the issue of "Canadian Engineer" in which there appeared a notice giving details regarding the call for tenders.

	Tenders	
Place of Work	Close	Issue
Ontario, Province of, supply of road oil	May 10	May 2
Hamilton, Ont., construction of sewer ..	May 22	May 2
West St. Paul R.M., Man., drilling of two wells	May 10	May 2
Edmonton, Alta., supply of regulators and transformers	May 15	May 2
Ottawa, Ont., supply of fibre conduit, "T" beams and cast iron manhole covers	May 12	May 2
Lethbridge, Alta., furnishing 13 cast iron gates	May 16	May 2
Fredericton, N.B., erection of Christ Church Cathedral Hall and Sunday School ..	May 25	May 2
Dresden, Ont., construction of concrete pavements	May 16	May 2
New Brunswick, Province of, gravel roads	May 16	May 2
Ontario, Province of, work on Provincial highways	June 2	May 2
Saskatchewan, Province of, construction of earth road from Bienfait to Estevan	May 17	May 2
Saskatchewan, Province of, construction of an earth road from Fairlight to the Manitoba Boundary	May 17	May 2
Wingham, Ont., construction of concrete pavements	May 11	May 2
Queenston Heights, Ont., sub-grading and construction of macadam roadway	May 24	Apr. 18
Toronto, Ont., construction of Gerrard St. bridge	May 16	Apr. 18
Montreal, Que., erection of Notre Dame Hospital	May 15	Apr. 23
Ford City, Ont., erection of school ..	May 10	Apr. 25
Newmarket, Ont., erection of arena building	May 10	Apr. 25
P. E. I., Province of, grading and concrete structures	May 19	Apr. 25
Quebec, Province of, road construction	May 12	Apr. 25
Winnipeg, Man., three 1000 k.v.a. transformers	May 15	Apr. 25
York Tp., Ont., concrete culverts	May 13	Apr. 25

BRIDGES, ROADS AND STREETS

Arthur, Tp., Ont.—Tenders will be received by Albert Hellyer, Township Clerk, Kenilworth, Ont., until 1.30 p. m., Tuesday, May 16, for the construction of three flat top concrete bridges. Specifications may be seen at the clerk's office.

Aurora, Ont.—Residents along Yonge St. have decided to urge the Provincial Government to widen Yonge St. to 100 feet.

Beamsville, Ont.—Highway construction under the Provincial department will start again about the 15th of the month. This means repairs and new construction all the way between Hamilton and Niagara and will include the main streets of Beamsville and Grimsby.

Blenheim Tp., Ont.—Tenders close May 10 for the construction of two concrete abutments and the erection of a steel bridge with concrete floor over Smith's Creek. Separate tenders for the concrete and the steel. Township Clerk, Hugh Allan, Drumbo, Ont.

Brockville, Ont.—Works Committee plans to repair a number of streets, including Brock St. west and Lewis St. Committee will look into a suggestion made by Ald. F. W. Logan that the town purchase a street-construction plant at an approximate cost of \$30,000. Chairman, George W. Warwick.

Burlington, Ont.—A by-law on the proposed paving of Brant St. will be submitted to the ratepayers. Clerk, L. Sykes, Burlington.

Calgary, Alta.—City Engineer Craig's department has \$25,000 at its disposal as the third instalment of the \$75,000 road graveling bylaw, which has now been two-thirds expended.

Chatham, Ont.—Tenders will be received by L. A. Pardo, Kent County Road Superintendent, Chatham, until 4 o'clock p.m., Monday, May 15, for the construction of about 1½ miles of concrete pavement in the suburban area adjoining the city of Chatham. Plans and specifications may be seen at the office of W. G. McGeorge, C.E., Chatham.

Chatham, Ont.—Tenders will be received by L. A. Pardo, Road Superintendent of Kent County, until noon, May 17, for the construction of about 7¼ miles of concrete pavement, 1¼ miles near Thamesville and 5½ miles between Wallaceburg and Dresden. Plans and specifications may be seen at the office of W. G. McGeorge, C.E., Chatham.

Cobourg, Ont.—Town Council decided to pave King St., from the eastern town limits to William St., at an estimated cost of \$127,000. Clerk, Ben Ewing.

Dundas, Ont.—Fire completely destroyed the new loading viaduct of the Canada Crushed Stone Co. causing a loss of about \$340,000.

Edmonton, Alta.—Temporary improvements to the south approach of the high-level bridge will be undertaken shortly by the city and provincial authorities. Estimated cost, \$7,000. Construction of a new west side approach has been endorsed. City Clerk, C. E. K. Cox.

Fredericton, N.B.—Province of New Brunswick is selling an issue of debentures amounting to \$500,000 for permanent bridges.

Fredericton, N.B.—Plans and estimates will be prepared for City Council on proposed extension of Aberdeen St. through York St. to University Ave.

Hamilton, Ont.—City Engineer E. R. Gray has advocated the paving of King St., from Sherman Ave. to the Delta.

Hespeler, Ont.—Town Council passed a resolution providing for the borrowing of \$2,477.32 for sidewalks. Clerk, M. E. Jardine.

Hespeler, Ont.—Town Council passed by-law authorizing construction of concrete sidewalk on east side of Kribs St. Clerk, M. E. Jardine.

London, Ont.—Improvements to certain highways leading out of the city have been recommended to the Town Planning Commission by Thomas Adams, Town Planning Expert, of Ottawa.

London, Ont.—City Council intends to construct sheet asphalt pavement on Wharncliffe Road, from Dundas St. to Oxford St.; Dundas St., from Wharncliffe Road to River Thames; Oxford St., from Wharncliffe Road to the River Thames; and on Talbot St., from Oxford St. to Carling's Creek. Total estimated cost, \$60,452.46. City Engineer, H. A. Brazier.

Longueuil, Que.—Council voted \$150,000 for construction of pavement, work to be done by day labor by city.

Malden Tp. Ont.—Bulk or separate tenders, addressed to Howard Gibb, Township Clerk, R. R. No. 2, Amherstburg, Ont., will be received until noon Monday, May 15, for the construction of a steel bridge 50 ft. span, abutments and grading over Big Creek. Plans and specifications may be seen at the office of the township clerk, or at the office of Lennox T. Bray, C. E., Amherstburg.

Montreal, Que.—City officials plan to open up Sherbrooke St. to the eastern limits of the city.

Montreal, Que.—Tenders close May 10 for the supply of 100,000 granite blocks, 150,000 gallons of bituminous dust layer and 40,000 tons of sand. City Clerk, Rene Bauset.

Nelson, B.C.—Ratepayers passed bylaw providing for an expenditure of \$60,000 on street improvements this year. City Clerk, W. E. Wasson.

Nelson, B.C.—Tenders will be called to close May 15 for the construction of 46 blocks of macadam. Mayor C. F. McHardy.

Nelson, B.C.—City Engineer has been authorized to proceed at once with the improvement of Water St., Ward St., Shatham St. and Victoria St.

Newmarket, Ont.—Tenders close May 10 for the paving of certain streets with either stone filled sheet asphalt, Warrentite-Bitolithic, concrete or macadam, approximately 12,000 sq. yds. Consulting Engineers, James, Proctor and Redfern, Ltd., Toronto.

New Toronto, Ont.—New Toronto will seek immediate co-operation with ratepayers of Long Branch, and Etobicoke Township and Mimico councils toward bringing before the Ontario Government the matter of the widening of the Toronto-Hamilton Highway.

North Bay, Ont.—City Council authorized Wm. N. Snyder, Town Clerk, to obtain prices on road oil.

North Bay, Ont.—Town Council authorized the Board of Works to purchase a ten-ton road roller. Clerk, Wm. N. Snyder.

North Oxford Tp., Ont.—Tenders, addressed to Richard Seldon, Clerk, Ingersoll, will be received until Saturday, May 27, for the construction of concrete abutments for bridge; also tenders for the building of grade to the bridge. Plans and specifications may be seen at residence of Reeve, Herbert Baigent, North Oxford, or at the Clerk's office, Oxford St., Ingersoll.

Oshawa, Ont.—A report recommending construction of pavements on Front St. and Centre St. was referred to the Board of Works.

Ottawa, Ont.—Tenders close May 9 for the supply and delivery of coarse sand. Commissioner of Works, A. F. Macallum.

Ottawa, Ont.—Contract for wood block pavement on Rideau St., from Sussex St. to MacKenzie Ave., awarded to O'Leary's, Ltd., at \$14,702.50; for asphalt pavement on Armstrong St., from Bayview to Garland, to the Standard Paving Co., at \$7,585.75; and from Parkdale to Holland, to the City Engineer at \$10,120.

Ottawa, Ont.—Hector Carruthers, secretary of the Ottawa Board of Trade, visited the council meetings of West Hull and Wakefield recently. At Wakefield the council undertook to keep that portion of the Ottawa-Wakefield road lying in the village of Wakefield, in repair if the Quebec government would rebuild the road. As South Hull and West Hull have already agreed to keep their portion in repair under similar conditions, that means the entire road is arranged with the exception of a stretch in Wakefield township between the village of Wakefield and the line of West Hull, a distance of probably three quarters of a mile.

Owen Sound, Ont.—City Council let contract to Dewar Bros. to crush and deliver stone on roads as required, at \$1.90 per yard.

Owen Sound, Ont.—Board of Works' Improvement program includes the paving of 6th St. and improvements to a number of other roads.

Peterboro, Ont.—Tenders close at 4 p.m., Wednesday, May 10, for approximately 7,000 sq. yds. of concrete pavement on George St. City Engineer, R. H. Parsons.

Point Grey, B.C.—Tenders for the construction of concrete sidewalks were received until May 2. Clerk, Henry Floyd, Municipal Hall, Kerrisdale, B.C.

Port Arthur, Ont.—Work on the construction of the automobile highway from Port Arthur to Nipigon is about to be resumed. The bridge over the McKenzie River is to be repaired and a new bridge will be installed over one of the big gullies near Sibley.

Portsmouth, Ont.—Council decided to repair Main St. Clerk, James Scally.

St. Lambert, Que.—Tenders will be received until 5 p.m., Monday, May 15, for asphalt pavement. City Engineer, E. Drinkwater. (See official adv.).

St. Lambert, Que.—A grant of \$20,000 for paving the Riverside Drive, to form part of the proposed St. Lambert-Levis riverfront highway, has been made to the city of St. Lambert by the Provincial Government. The City will call for tenders for the asphalt paving of the drive in the near future.

St. Thomas, Ont.—City Council let contract to the Standard Paving Co., of Ottawa, for the asphalt pavement work to be undertaken this year. Contract is for both the laying of the asphalt surface at \$1.98½ per sq. yd., and the excavating and construction of the concrete base, at \$1.49 per sq. yd. Contract for construction of curbs and gutters and also for concrete sidewalks was awarded to William Irwin & Son. The price for sidewalks is 22c. per sq. ft.; for gutters, 60c. a ft.; and for curbs and gutters combined, 98c. a ft.

Saskatchewan, Province of.—Tenders will be received until 12 o'clock noon, Tuesday, May 23, for construction of earth roads from the northeast corner of Section 36, Township 33, Range 12, west of the 2nd meridian to Wadena; also from north of Watson to St. Gregor. H. S. Carpenter, Deputy Minister of Highways, Regina.

Simcoe, Ont.—Alternate tenders for concrete pavement or Tarvia macadam pavement for the County of Norfolk will be received until 6 o'clock p.m., May 13, addressed to Guy R. Marston, County Engineer, Simcoe. Plans and specifications may be seen at the County Engineer's office, Simcoe.

Stratford, Ont.—Board of Works recommended to City Council construction of sidewalk on east side of Birmingham St., from Easson St. to McFartane St.

Stratford, Ont.—City Council referred petitions for sidewalk on south side of Norfolk St. and pavement on McKenzie St. to Board of Works.

Stratford, Ont.—Board of Works recommended that pavement work be proceeded with on following streets: Perth, from Downie to Whitney; Front, from East Gore to Perth; McNab, from Grant to Whitelock; Grant, from Downie to Home; Home, from Grant to West Gore. Adopted by City Council.

Stratford, Ont.—City Council passed by-law authorizing construction of pavements on following streets: Erie, from St. Patrick to Ontario St.; St. Patrick, from Erie to Wellington; Huron, from Ontario to Douglas St.; Front, from Downie to Home St.; and Home, from Grant to West Gore St. City Engineer, A. B. Manson.

Stratford, Ont.—Work on the Provincial highway between here and Kitchener will be commenced in the near future. It is proposed to grade the road this year, and paving will possibly be done next year. Provincial Highway Department intends to construct a highway 86 ft. wide, or 10 ft. wider on either side than at present.

Stratford, Ont.—City Council intends to construct excavation, concrete base, concrete combined curbs and gutters and drainage, with bituminous surface, on the following streets: Erie, \$19,952.73; St. Patrick, \$5,556; Huron, \$18,326; Rebecca, \$12,904.60; and St. Patrick, \$5,426.95. City Clerk, W. H. Dorland.

Toronto, Ont.—City Council passed sidewalk debenture by-law for \$256,772.

Toronto, Ont.—City Council intends to construct concrete curbs on Bingham Ave. at a cost of \$1,620.

Toronto, Ont.—City Council authorized construction of lane between Roxton Road and Ossington Ave., south of College St.

Toronto, Ont.—Mount Pleasant Road Ratepayers' Association has asked the City Council to back up the transportation Commission in giving a service in the district by extending Mount Pleasant road pavement both north and south and finishing the road from Eglinton Ave. to Merton Street.

Toronto, Ont.—Hon. F. C. Biggs, Provincial Minister of Public Works, has introduced a bill in the Legislature to authorize the raising of from \$25,000,000 to \$30,000,000 for provincial good roads from motor vehicle fees. The purpose of the bill is to provide funds for expenditure during the next three years, sufficient to put the entire eighteen hundred miles of provincial highways in satisfactory condition for the close of traffic they are intended to carry.

Victoria, B.C.—By-law authorizing the borrowing of \$110,000 to complete the Johnson St. bridge will be submitted to the ratepayers.

Victoria, B.C.—Tenders received for the completion of the Johnson St. bridge were as follows: Canadian Bridge Co., \$213,500; J. Coughlan & Sons, \$237,100; Dominion Bridge Co., \$252,300. Contract awarded to Canadian Bridge Co.

Walkerville, Ont.—Following petitions for local improvements have been presented to the Town Council. Pavement in alley between Argyle and Monmouth roads, from Wyandotte to Niagara St.; pavement in alley between Walker and Monmouth roads, from Tuscarora to Niagara St.; pavement in alley west of Lincoln road, from Sandwich to Wyandotte Streets. Town Clerk, A. E. Cock.

Westmount, Que.—Council decided to construct asphalt on Avenue Road east of Mount Pleasant Ave.

Whitby, Ont.—Tenders will be received by D. J. Kean, Ontario County Road Superintendent and Engineer, County Buildings, Whitby, until noon, May 15, for the construction of several reinforced concrete culverts. Plans and specifications may be seen at the Engineer's office.

York Tp., Ont.—Tenders will be received by Frank Barber, Township Engineer, until 12 o'clock noon, Saturday, May 20, for concrete sidewalks. (See official adv.).

York Tp., Ont.—York Township Council received notice from the York County Highways Commission that Scarlett Road, from Lambton to Weston, and Weston Road, from Buttonwood Ave. to Weston, would be paved this summer.

WATER, SEWAGE AND REFUSE

Brockville, Ont.—Works Committee passed by-law providing for the construction of a sewer on Front Ave., between Park and Ormond Streets. Chairman, George W. Warwick.

Cowley, Alta.—Village council is issuing debentures to the extent of \$1,000 for improvements to water works system. Sec.-Treas., M. A. Murphy.

Elko, B.C.—East Kootenay Power Co., Ltd., has been formed to take over the B. C. and Alberta Power Co. The company is installing a plant on the Elko River near here, which will have a capacity of 20,000 h.p.

Fredericton, N.B.—City Council plans extension of water works system up Woodstock Road, at cost of \$25,000.

Ford City, Ont.—Further water main extensions are being ordered by the Town Council. Clerk, J. F. Foster.

Halifax, N.S.—City Works Committee approved award of contract to Gorman & Peckham for water main pipe from the corner of Quinpool road to the foot of Cogswell St., and for sewer on South St., from Queen St. west.

Leamington, Ont.—Town Council is calling for tenders for sewers in Clarke St. West, Foundry St. and Chestnut St. Clerk, R. M. Selkirk.

Levis, Que.—City Council has been notified by Hon. Athanasios David, Provincial Secretary, under whose depart-

ment is the Superior Council of Hygiene, to the effect that a filtration plant must be built immediately. Estimated approximate cost, \$545,000.

Montreal, Que.—The construction of a sewer on Nicolet St., between Masson St. and St. Joseph Boulevard has been recommended to the city council by the Executive Committee. The cost will be \$17,343. The committee has placed at the disposal of the superintendent of the aqueduct \$31,339.84 to defray the cost of laying water mains.

Nelson, B.C.—Plans are being prepared by the City Engineer for a sewer in Fairview.

Orillia, Ont.—By-law submitted to ratepayers on May 8 authorizing an expenditure of \$30,000 by Water, Light and Power Commission for water works extensions and improvements. Clerk, C. E. Grant, Orillia.

Ottawa, Ont.—City Council approved the decision of the Board of Control to have the excavation work for the addition to the overland pipe done by day labor. The amount involved is about \$20,000.

Petrolia, Ont.—Contract for steel reservoir awarded to Horton Steel Works, Bridgeburg, at \$14,200, and for foundation to Alfred Kirkpatrick, of Petrolia, at \$2,594. Contract for pump not yet awarded.

Port Credit, Ont.—It is expected that tenders for the new water works system, which, it is estimated, will cost \$110,000, will be called for within a few days. The plans, which the Town Council approved, will now go to the Provincial Board of Health.

Riverside, Ont.—Extensive laying of water mains has been started by the Walkerville Water Co. Secretary, Charles D. Brown.

St. Thomas, Ont.—No. 2 Committee of City Council recommended construction of a sanitary sewer in Hiawatha St. and under Fourth Ave., between Myrtle and Locust Sts.

Sault Ste. Marie, Ont.—Tenders addressed to the Mayor will be received by the City Clerk until 5 p.m., May 15, for the construction of sewers. (See official adv.).

Smith's Falls, Ont.—Dr. J. W. S. McCullough and Engineer F. A. Dallyn, from the Provincial Department of Public Health, addressed a public meeting in Smith's Falls recently, urging the speedy installation of a filtration plant in connection with the waterworks system.

Stratford, Ont.—City Council referred petitions for sanitary sewer on Whitelock St., from McNab St. to Mowat St., and for water main on Downie St., to Board of Works.

Stratford, Ont.—Public Utilities Commission let contract for two gasoline engines for the water works department from the Canadian Fairbanks Morse Co., Toronto, and for a venturi meter to the Goldie & McCulloch Co., Galt.

Thorold, Ont.—Tenders addressed to D. J. C. Munro, Town Clerk, will be received until 12 o'clock noon, May 13, for the construction of sewers. (See official adv.).

Thornbury, Ont.—Town Council is submitting a by-law to the people for a water works supply system, voting to take place on May 22. James, Proctor and Redfern, Ltd., of Toronto, are the engineers.

Todmorden, Ont.—A public meeting of the Ratepayers' Association will be held on May 9, when a sewage scheme for the eastern part of the township and the proposed viaduct from Todmorden to Leaside will be discussed. At a recent meeting President Amos Allpress outlined four sewerage schemes suggested by York Township Engineering Department that might be used in this district. The drainage system to the Don Valley northward was favored.

Toronto, Ont.—Contracts for laying and jointing of 6-in. water pipes in Armadale Ave. and Parkway Gardens, awarded to Ruselca Bros.

Toronto, Ont.—City Council intends to construct a sewer in Fairmount Crescent at a cost of \$3,700; also a water main in Hillhurst Boulevard, at cost of \$2,451.

Toronto, Ont.—Street Commissioner Wilson has recommended an expenditure of \$6,000 to rebuild one of the furnaces at the western incinerator, pending the construction of a modern garbage destructor.

Toronto, Ont.—Ontario Railway Board has sanctioned city by-laws to issue debentures to the amount of \$315,000

for water works purposes, \$200,000 being for intake repairs and \$102,000 for the Yonge St. main.

Toronto, Ont.—Time for receiving tenders for the installation of one four-million Imperial gallon centrifugal pump at the Island Pumping Station has been extended from Tuesday, May 16, to Tuesday, June 13.

Westmount, Que.—Council authorized construction of sewer on Thornhill Ave., between Sherbrooke and Cote St. Antoine Road.

Woodbridge, Ont.—Council has instructed James, Proctor & Redfern, Ltd., of Toronto, to submit plans to the Provincial Board of Health that the by-law for water works supply system may be published at once.

York Tp., Ont.—Tenders will be received at the office of Frank Barber, Township Engineer, Toronto, until 12 o'clock noon, Saturday, May 20, for the construction of cast iron water mains. (See official adv.).

LIGHT, HEAT AND POWER

Hanna, Alta.—Town Council decided to purchase electric lighting plant for \$10,000.

St. John, N.B.—Tenders will be received by the New Brunswick Electric Power Commission until 6 o'clock, Tuesday, May 16, for the construction of a transmission line from St. John to Moncton. The Commission will supply all material. Plans and specifications may be seen at the office of the Commission in St. John.

RAILWAYS

Petrolia, Ont.—An agreement has been entered into with the Grand Trunk Railway Co. for the construction of a spur line railroad from their tracks to the Peninsular Sugar Co. site here.

Windsor, Ont.—Contract for the new Canadian Pacific Railway freight sheds and team tracks on Janette Ave. has been awarded to the Haymon Construction Co., of London. Estimated cost, \$200,000.

FACTORIES AND LARGE BUILDINGS

Amherst, N.S.—Dominion Government voted \$5,000 for drill hall, grading, etc., here.

Blenheim, Ont.—P. T. K. Lee Plans erection of one-story building for theatre.

Bridgeburg, Ont.—Town Council accepted the plans of C. M. Borter, architect of Niagara Falls, Ont., for the proposed new Town Hall.

Calgary, Alta.—Representatives of the Calgary G. W. V. A., City Council and Alberta government recommended to the executive of the local G. W. V. A. that the general contract for the new building be awarded to Gauley and Vandenhoozen, for \$34,393, and contract for plumbing and heating to Snyder & Co., for \$7,680.

Calgary, Alta.—Following tenders for new central stores and laundry building at the General Hospital were opened by the city commissioners and forwarded to City Engineer Geo. W. Craig for tabulation: Lancaster and Poulsen, \$16,445; Forster Construction Co., \$15,885; W. H. Cawston, \$15,800; City Engineering Department, \$15,791; Gauley & Vandenhoozen, \$15,374; Baird Construction Co., \$14,995; F. W. McDougall Construction Co., \$13,240. These tenders do not include plumbing, heating, elevator and electric work.

Calgary, Alta.—Following tenders were opened on April 27 in the offices of Burrell & Basevi, architects, for the erection of the new memorial hall and club rooms of the Calgary Great War Veterans' Association; General contract—Gauley & Vandenhoozen, \$38,419 and \$37,822; Thomas Jamieson, \$40,950 and \$40,550; O. J. Hurst, \$39,972 and \$39,297; R. J. Burns, \$44,339 and \$43,830; C. W. Pettifer, \$38,500 and \$37,750; Watson & Abercrombie, \$39,614 and \$38,964; Baird Construction Co., \$39,200 and

\$38,700. The first price in each case is with stone cornice and stone coping, and the latter price with metal cornice and metal coping. Plumbing and heating—Snyder & Co., \$7,995; James Ballantyne, \$8,002; J. Rogers, \$8,700; Campbell & Hillier, \$9,035; Parkinson & Davidson, \$8,500. Contract not yet awarded.

Demaine, Sask.—Most of the business section of the village was recently destroyed by fire. Loss, \$40,000.

Dundas, Ont.—Town Council passed a by-law providing for raising of \$15,000 as a loan to Frederick Powell Thornton to assist in the construction of a factory.

Dundas, Ont.—Plans are being rushed for the immediate reconstruction of the part of the Canada Crushed Stone Corporation's plant which was recently destroyed by fire. Mr. Buckbee, of Chicago, the company's consulting engineer, is looking after the work.

Edmonton, Alta.—Contract for erection of Roman Catholic separate school awarded to H. J. Manson, the cost to be between \$45,000 and \$50,000.

Edmonton, N.B.—Dominion Government Department of Public Works considering the construction of a post office, customs building, etc., here.

Ford City, Ont.—Town School Board passed a resolution that immediate notice be sent to Architect A. H. McPhail to hurry up specifications and letting of tenders on the new \$100,000 Charlotte St. School.

Fort William, Ont.—Contract for erection of Crawford Ave. School awarded to John East Co., of Fort Frances, at \$71,183.16.

Halifax, N.S.—Provincial exhibition will be revived if the Commission is able to secure funds for the erection of buildings, which would cost approximately \$450,000. Address M. Mc. F. Hall.

Hamilton, Ont.—Bulk and separate tenders will be received by David Smith, Secretary, School Section No. 4, Ancaster and Barton, 77 Macnab St. north, Hamilton, until 4 p.m., Wednesday, May 17, for the different trades required for the erection of school building on Bowman St., West Hamilton. Plans and specifications on application to Warren & McDonnell, architects, Home Bank Bldg., Hamilton.

Kentville, Ont.—Contract for erection of King's County Poor House awarded to Denton & Condon.

Kitchener, Ont.—The Kitchener Orphanage Board have announced that plans are under way for the erection of a new building this summer. The institution will be outside the city limits on the Natchez Road, and will cost approximately \$70,000.

Leamington, Ont.—An addition to the High School is planned. Estimated cost, \$35,000, and \$5,000 for gymnasium. Tenders will be called. Address W. D. Cox.

Lethbridge, Alta.—Tenders were received until May 8 for alterations, additions and repairs to the Board of Trade building. Commissioner of Public Works, H. Wm. Meech.

London, Ont.—Plans of John R. Boyde, Architect, of Windsor, for three new Roman Catholic churches in London diocese, have been approved. Churches will be erected in North Chatham, Petite Cote and Leamington.

London, Ont.—That London should dispose of the Federal Square site on Dundas St. and with the proceeds purchase the deanery at Clarence and Queen's for the location of a new city hall and civic center, is one of the several tentative suggestions submitted by Thomas Adams to the Town Planning Commission.

Medicine Hat, Alta.—Fire caused an estimated loss of \$125,000 when the buildings and plant of the Medicine Hat Pump and Brass Manufacturing Co. were destroyed recently. The damage is covered by insurance to the extent of \$60,000.

Mimico, Ont.—Town Council passed by-law providing for the raising of \$65,000 for erection of new Public School. Clerk, C. J. Telfer.

Moncton, N. B.—Mann's Pasteurized Milk Factory, situated in Lewisville, was destroyed by fire recently. Loss, \$8,000; insurance \$4,000.

Moncton, N.B.—Plans for the erection of an 8-room school on Lester Ave. have been received by the Board of School Trustees. Trustees Fryers, Steeves and Sears were appointed a committee to consider same.

Montreal, Que.—Three new schools are being put in hand for the Protestant Board of School Commissioners, as well as one extension, the total estimated value of the four jobs being \$500,000. The Board will also provide school accommodation in the part of the territory of St. Laurent that lies within the city of Montreal (mainly Cartierville). The Catholic School Commission's program is nine new schools and three additions, at a cost of \$1,584,000.

Mount Elgin, Ont.—Tenders for the erection of a Continuation School will be received until May 15. Plans and specifications may be seen at office of F. H. Harris, Sec.-Treas., Mount Elgin.

Mountain, Ont.—B. Dillon, architect, is preparing plans for the erection of a consolidated school here to serve four rural school sections in Dundas county, which are to be amalgamated.

Nelson, B.C.—Contract for erection of Memorial Hall in connection with St. Saviour's Church has been awarded to W. Pascoe and the plumbing contract to Harry-Epenson. Stone construction. Total cost, \$14,000.

Ontario, Province of.—Dominion Government voted \$349,200 for public buildings in Ontario.

Oshawa, Ont.—Permit issued for rebuilding of the Thornton rubber factory for W. E. Phillips, Ltd. cost, \$20,000.

Oshawa, Ont.—Town Council granted the Board of Education \$200,000 for two new schools and repairs to existing public and high schools.

Ottawa, Ont.—Dominion Government voted \$38,000 for improvements and repairs to Dominion public buildings in the Maritime Provinces.

Ottawa, Ont.—Ottawa Auxiliary Bible Society plans erection of permanent Bible House on north side of Lisgar St. Vice-president, Rev. S. J. Farmer.

Ottawa, Ont.—Jewish people of this city will launch a campaign on May 15 to raise \$35,000 for the erection of a community centre building. Chairman of committee, Sam Bilsky.

Ottawa, Ont.—Dominion Government voted the following amounts for public buildings: British Columbia, \$59,519; Alberta, \$31,000; Saskatchewan, \$27,000; and Manitoba, \$40,500.

Ottawa, Ont.—An addition to cost \$20,000 is to be added to St. Matthew's Anglican church in the Glebe. Plans will be completed and tenders called for. Millson and Burgess are the architects.

Owen Sound, Ont.—Plans for the proposed addition to the Collegiate Institute were presented to the Board of Education by the architects, J. T. Clark, of this city, and McGiffin & Smith, Toronto. Board accepted plans.

Partridge Island, N.B.—Dominion Government voted \$35,000 for repairs and improvements to the St. John quarantine station here.

Peterboro, Ont.—Contract for re-roofing the Brinton Carpet Company's factory on Lock St. awarded to James Fennie.

Port Credit, Ont.—Permission granted by Town Council to Methodist Church members to proceed with the erection of a Sunday School and recreation hall, at a cost of \$22,000.

Port Dover, Ont.—A. C. Stewart and Sons have started work on the removal of the old foundations of the Tibbetts block preparatory to the erection of a building to be occupied by the post office and J. G. Patterson, druggist.

Quebec, Que.—The club house of the Quebec Golf Club at Montmorency Falls was destroyed by fire recently. Loss, \$20,000.

Quebec, Province of.—Provincial Government has decided to add a new wing to the Parliament Buildings which will be erected on St. Julia St. Estimated cost, \$700,000. Minister of Public Works, Hon. Antonin Gaillet.

Quebec, Que.—Following contracts awarded for erection of Immaculate Conception School: Masonry, Magloire Cauchon, \$58,086; plumbing, F. Gingras, \$9,953; painting and glazing, J. Tardivel, \$2,578.50; roofing and ventilation, Omer Barbeau, \$1,964.

St. George, N.B.—Dominion Government Department of Public Works considering the construction of a post office and customs house here.

Silverthorn, Ont.—Local branch G. W. V. A. will start work at once on addition to Memorial Hall. Cost, \$4,000. Address A. Hammond.

Stayner, Ont.—Tenders closed May 6 for the erection of an 8-roomed school building. Secretary, Jas. Peattie, Stayner.

Stratford, Ont.—Board of Education let contract for erection of a 4-roomed school to Pounder Bros., Stratford, for \$58,500.

Stratford, Ont.—By-law passed by City Council providing for the raising of \$50,000 for an addition to Hamlet Ward School. City Clerk, W. H. Dorland.

Sussex, N.B.—Dominion Government voted \$5,000 for improvements to public buildings here.

Swansea, Ont.—Members of Morningside Presbyterian Church plan erection of Sunday school building. Pastor, Rev. J. G. Cheyne.

Toronto, Ont.—Coca-Cola Co., 1621 Queen St. West, plans erection of new plant. Manager, George Porter.

Toronto, Ont.—Members of Greenwood Avenue Presbyterian Church plan erection of Sunday School building at corner of Gilebemoat and Greenwood Ave. at a cost of \$35,000.

Toronto, Ont.—H. Addison Johnston, managing director of Professional Officers, Ltd., asked the City Council to order the issuing of a permit for the physicians and surgeons building to be erected at 86 Bloor St. west held up on account of the widening project.

Toronto, Ont.—Board of Education will receive tenders until May 10 for the following work: (1) Masonry, structural steel, carpentry, plumbing, heating and ventilating, electric wiring, local phones, for Parkdale Collegiate and Roden School; (2) masonry, structural steel, carpentry, roofing and tinsmithing, plastering, painting and glazing, plumbing, heating and ventilating, electric wiring, local phones, for Norway School; and (3) electric wiring for Ogden School.

Vancouver, B.C.—Pacific Starch Products, Ltd., will build a plant in south Westminster, at a cost of \$40,000.

Wainstead, Ont.—Fire destroyed the G. T. R. station here.

Welland, Ont.—Contracts for the erection of the new main mill building of the Lackawanna Tubes' plant were let as follows: Foundation work, Jay C. Diffin; steel and erection of building, Standard Steel Construction Co.

Westmount, Que.—Plans for the proposed new City Hall will be considered at a special meeting of the Westmount City Council.

West Toronto, Ont.—A campaign to raise \$15,000 for the erection of a new church building has been launched by St. Paul's Anglican Church.

Whitely, Ont.—Contract for erection of four-room continuation school awarded to U. H. Peardon, Windsor, Ont.

Windsor, Ont.—Members of Bruce Ave. Baptist Church plan erection of new church building on Victoria Ave., south of Wyandotte St. Pastor, Rev. Owen C. Gray.

Windsor, Ont.—Plans are being prepared by Architects Pennington & Boyd, of this city, for the erection of a convent at Woodlee at a cost of \$10,000, and for Beech Grove Country clubhouse.

Windsor, Ont.—French Canadians of the Esser Border are contemplating the establishment of a school in this city. An organization known as the League Des Patriotes, of which Ernest Parent, Windsor, is president, has been formed to raise the necessary funds.

Winnipeg, Man.—Tenders close May 10 for concrete work (floors, etc.) to be carried out at the North End and

A Weekly Paper for Civil Engineers and Contractors

New Highway Bridge Over Batiscan River, Que.

Important Link Completed in Montreal — Quebec Highway — Six Fixed Spans of 189 ft. and 62-Ft. Bascule Span — Pile Foundations on Soft Clay — Great Care in Computing Counterbalancing—Easy Operation of Bascule

By EDWARD HOLGATE

Chief Engineer, MacKinnon Steel Co. Ltd., Sherbrooke, Que.

ON NOVEMBER 1, 1921, the new bridge at Batiscan, Que., about twenty miles east of Three Rivers, on the automobile road between Montreal and Quebec, was opened to regular traffic. Motorists in particular will rejoice that the delays of the old ferry are a thing of the past.

The bridge, shown in process of construction in Fig. 1, is 1211 ft. long with a concrete roadway 18 ft. wide between the steel wheel guards. There are six main spans, each 189 ft. centre to centre, and one bascule span 62 ft., centre to centre. The structure was designed for the following live loads: (a) A uniformly distributed load of 100 lb. per sq. ft. of road for floor system and directly affected truss members, and 83 lb. per sq. ft. for truss chords and main diagonals; (b) an alternative moving concentrated load of 15 tons distributed as ten tons and five tons on each of two axles 10 ft. apart. On members determined by the latter, an impact of 30% of the live load was added. Unit stresses were in accordance with the requirements of the Department of Public Works and Labor, Quebec, which practically conform to the specifications of the E.I.C.

Foundations

While the present article deals chiefly with the superstructure, some remarks will first be made concerning the foundations. The six concrete piers stand on soft blue clay which extends to a depth of over 90 ft. with practically no change in character. The spread of the concrete bases is arranged to give a maximum pressure of $2\frac{1}{4}$ tons per sq. ft. The concrete piers were started about 7 to 12 ft. be-

larger than the others. Its base is 25 by 45 ft. and rests on 166 wooden piles enclosed by steel sheet piling. The lengths of the interior piles are arranged so that their lower ends form a dome with its apex at the centre of the pier, an expedient which probably induces an arch action in the clay. When building the superstructure over this pier, it was found that the addition of 300 tons of dead load produced no settlement that could be detected by the ordinary levelling instruments, and it is safe to say that, if any such occurred, it was less than $\frac{1}{4}$ in.

Main Spans

The six main spans are alike and have trusses of Baltimore type with top chords cambered about three feet. The latter effected a slight economy in material and improved the appearance of the bridge, especially when seen as foreshortened. The end floorbeams are designed to enable each span to be jacked up from the pier, a clearance for jacks being provided by standing the trusses on concrete pedestals about 20 in. high. Expansion joints on alternate piers are arranged as shown in Fig. 2. These spans were erected on falsework, placing floor systems and bottom chords first and erecting upper chords and web members when returning with the traveller.

Bascule Span

The bascule span was designed by the Strauss Bascule Bridge Co., and is noteworthy for its simplicity and neat appearance. The counterweight is unobtrusive and is

FIG. 1.—BATISCAN BRIDGE UNDER CONSTRUCTION.

low the bed of the river within an enclosure of Lackawanna steel sheet piling extending down about 27 ft. farther. Inside this enclosure wooden piles were driven to a depth of about 45 ft. below the sheet piling, and many of them were provided with friction vanes nailed thereto consisting of 4 by 5 in. wood pieces about 12 ft. long. Pier 5, on which rest the bascule and adjacent span carries a total load, exclusive of its own weight, of about 450 tons and is

probably not noticed by most passengers over the bridge, as it aligns with the portal and sway bracing of the adjacent spans. The bridge consists of two half-through plate girders of peculiar shape connected by five floorbeams consisting of 24 in. 1 beams, 23 ft. 10 in. long which carry seven lines of 9 in. beam stringers. Over these are laid a 4 in. creosoted pine floor and $1\frac{1}{2}$ in. wearing floor of the same material with 4 by 6 in. timber wheel guards pro-

viding a road 18 ft. wide. The bridge can be opened by hand power in seven minutes or by the gasoline engine in $1\frac{1}{2}$ minutes.

Counterweight

Much of the success which attended the erection and operation of the bascule bridge was due to the great care

FIG. 2—EXPANSION JOINT IN ROADWAY BETWEEN END FLOORBEAMS OF ADJACENT SPANS

taken in calculating the weight and centre of gravity of the moving parts and in determining the weight and dimensions of the concrete counterweight. The weights of the individual parts of the moving bridge were taken from the shop drawings and their moments figured about two rectangular axes through the centre of the main trunnion. The wooden flooring formed a large proportion of this moment and it was therefore decided to carefully weigh many samples of the wood. Eleven samples of 4-in. plank, creosoted, varied in weight from 4.32 lb. to 5.83 lb. per ft. B.M., with an average of 4.83 lb. Six samples of 6-in. timber, creosoted, weighed from 4.21 to 4.58 lb. per ft. B.M., averaging 4.35 lb. Eight samples of $1\frac{1}{2}$ -in. plank, creosoted, varied between 4.07 and 6.34 lb. per ft. B.M., averaging 5.11 lb. These figures indicate much variation, but the averages suggest that the thinner plank received a greater penetration of creosote. In building the counterweight, the forms were very carefully made, and owing to

FIG. 3—FIRST STAGE OF ERECTION OF BASCULE SPAN — MAIN GIRDERS BEING RAISED TO HORIZONTAL POSITION ACROSS SHIP CHANNEL

cold weather, a rich concrete mixture, 1:2:4 was used. A sample of concrete as poured weighed $146\frac{1}{2}$ lb. per cu. ft. when 3 days old, and $145\frac{1}{2}$ lb. after the forms had been removed a week. In dimensioning the counterweight, it was arranged to have its centre of gravity almost coincident

with the vertical through the rear trunnion pin, but enough outside to keep the upper link always in tension.

Erection of Bascule Span

In erecting the bascule span, the four pedestals supporting the trunnion bearings were first set in line by transit on pier No. 4 and by steel tape across the ship channel. Great care was taken to set the tops of these pedestals in true line and level. No shim plates were used but precision was obtained by wedging under the shoes and grouting thereto after the milled plates on top were exactly in position. The bearings were then placed and the holes connecting them to the pedestals were drilled. Figures 3, 4 and 5 show stages in erecting the bridge. At seven o'clock one morning the two girders, each weighing 10 tons, were brought alongside pier 5 on a scow. Owing to their irregular shape and to economize time and lessen the risk, the position of the centre of gravity of each girder had been calculated and marked thereon and wire rope slings attached before the scow left the river bank. Hence, it took but a very short time to raise the girders and place them horizontally across the ship channel resting on the trunnion bearings at one end and on pedestals over pier 4 at the other. Four of the floorbeams with bracing were then inserted and the derrick fall was attached to the outermost floorbeam. At 4 p.m. the bridge was opened to practically its highest position, leaving the ship channel clear, and it was guyed to span 5. The remainder of the steelwork was then erect-

FIG. 4—SECOND STAGE OF ERECTION OF BASCULE SPAN — RAISING GIRDERS, FLOORBEAMS AND LATERAL BRACING TO CLEAR SHIP CHANNEL

ed by the derrick and the wooden floor laid. The 160 tons of concrete for the counterweight was deposited by bucket lifted by scow-derrick alongside the pier. Five days after pouring the concrete, the shoring under the counterweight forms was knocked out and the bridge found to be in exact balance without further adjustment. It was lowered straight to clear-road position by the hand lever and was ready for traffic. Then followed the erection of operator's house, safety gates and gasoline engine equipment.

Bascule Machinery and Accessories

The hand winch operates through four series of reduction gears to the pinions engaging the racks attached to the main girders. Gears are cast steel with machine cut teeth. One man could move the bridge without difficulty from the moment the counterweight was released. A 20-h.p. Gray motor, 4-cylinder, 4-cycle, operates a reversible transmission gear with clutches as an alternative to the hand movement. When in the lower position the bridge is locked to

the pedestal on pier 4 and these locks are withdrawn by a lever near the trunnion pin. The lever, however, cannot be moved until an adjacent handle is turned to close the gate across the road beyond pier 4.

The bridge was built under the supervision of Ivan E. Vallee, Chief Engineer of the Department of Public Works

FIG. 5—THIRD STAGE OF ERECTION OF BASCULE SPAN — COMPLETING STEELWORK, FLOOR AND COUNTERWEIGHT WHILE BRIDGE IS GUYED BACK TO SPAN 5

and Labor, Quebec. Joseph Gosselin, Ltd., Levis, Que., built the substructure and concrete floor. The steel supererected by the MacKinnon Steel Co., Ltd., of Sherbrooke, structure, including bascule machinery, was furnished and Que.

LONDON BRIDGE WORKS NEW PLANT

GROUND has just been broken for the new plant of the London Bridge Works, Ltd., London, Ont., which will be of modern steel fireproof construction throughout and equipped with the latest machinery for the production of steel structures of all kinds, chiefly bridges and buildings. The plant will be built on an improved factory site formerly owned by the Dominion Cannery, Ltd., located just off Dundas Road on the Grand Trunk Railway, consisting of about three acres, which will give ample space for the time being.

In conjunction with the regular business of fabricating steel, an extensive warehouse will be built and equipped for the distribution of iron and steel products of all kinds, including steel plates, structural shapes, iron and steel bars, black and galvanized sheets etc. The plant and warehouse, when completed, about June first, will fill a long felt want in that part of the Province and will be much appreciated by builders and contractors in the district.

The company is incorporated under the Ontario Companies' Act with \$100,000 capital, the officers and directors being as follows: President, T. J. Dillon, Welland, Ont., President Standard Steel Construction Co.; Vice-President, Geo. M. Reid, London, Ont.; Directors, Philip Pocock, London, Ont., E. S. Little, London, Ont., Col. I. Leonard, London, Ont., C. J. Madgett, Welland, Ont., H. C. Baker, Welland, Ont. C. J. Madgett, formerly assistant general manager of the Standard Steel Construction Co., of Welland, will be the general manager.

GOOD ROADS ASSOCIATION MEET AT VICTORIA.

AMONG the speakers who have already accepted invitations to present papers for discussion at the Convention of the Canadian Good Roads Association at Victoria, B.C., on June 12-15 are the following: M. A. Lyons,

chief engineer of Roads Board, Province of Manitoba; C. W. Dill, superintendent of Highways, province of Saskatchewan; A. W. Campbell, Commissioner of Highways for the Dominion Government; J. D. Robertson, Deputy Minister of Public Works, Alberta; A. H. Hearst, State Highway Engineer of Wisconsin; B. M. Hill, chief engineer of Highways, Province of New Brunswick; J. A. Duchastel, city manager and engineer, Outremont, P.Q.; James Allen, Supervisor of State Highways, Olympia, Wash.; F. L. McPherson, superintendent of Public Works, Victoria, B.C.; W. A. McLean, deputy minister of Highways, Ontario; F. L. Fellows, city engineer of Vancouver, B.C.; H. S. Carpenter, deputy minister of Highways, Saskatchewan; A. S. McMillan, superintendent of Highways, Nova Scotia, and N. D. Darlington, chairman of the California Highways Commission.

This is not by any means the full list of the speakers who will deal with the road matters, from the financial, legislative and practical standpoint, including foundations, drainage, wearing surfaces, bridges, culverts and so on. Of special interest to Government officials who have to tackle the problem of highway maintenance in relation to modern automobile traffic, will be an address on motor trucks, maximum weight, width, loads, etc. by a representative of the National Automobile Chamber of Commerce, New York, while among the popular lectures will be one by H. D. Cuthbert, of the North West Pacific Tourist Association, whose address at the Winnipeg Convention was so much appreciated. Of particular interest to the prairie province delegates will be a lecture and demonstration by K. A. Clark, one of the research engineers of the Scientific and Industrial Research Council of Alberta, who has been making experiments in improving and maintaining prairie roads, and a method of getting bitumen absorbed on to the clay elements in soils to modify its action towards water.

The annual general meeting of the Canadian Good Roads Association will take place on the afternoon of Tuesday, June 13, when the annual report and financial statement will be presented and the officers and executive elected. The banquet will be on the Wednesday evening at the Empress Hotel. The Canadian Automobile Association will hold their annual meeting and dinner at noon on Wednesday, June 14, at which delegates from all the motor leagues in Canada will be present, the invitations having been sent out by W. G. Robertson, the secretary of the national association with which all the provincial motor leagues are affiliated.

ENGINEERS ADVOCATE NATIONAL DEPT. OF PUBLIC WORKS.

ENGINEERS started many years ago to urge the creation of a National Department of Public Works says a L. W. Wallace executive secretary of the Federated American Engineering Societies in a statement issued recently. Their sole reason was that the country needed, and still needs, the orderly functioning of its public works activities—needs it because our present system involves a huge waste of public funds, high taxes, and retarded public improvements. The principle is self-evident and if the proposed reform were merely an abstract principle there would be no one to dispute its merit.

The public works movement has been so successful that the matter has become a national issue, and it has been recognized generally that the principles underlying that movement should control in other functions of government. The Federated American Engineering Societies has become officially concerned with the creation of a Department of Public Works. It is apparent that the object can never be achieved unless the broader object is carried through successfully; therefore this organization, as well as all others which believe in efficient procedure and who know and understand the underlying principles, must participate in the entire program of government reorganization.

ESTABLISHING OF PLANT BASE LINES AS AN AID TO THE ENGINEER

Developing Base Lines in Industrial Plants — Locating Line and Placing Monuments — Design of Concrete Monuments

By J. LeRoy Underhill

IT HAS always appeared to the writer that the necessity of establishing permanent base lines, as a locus standi for engineering work in plants, has been greatly underestimated. In a great number of plants no permanent reference line is found and in many it is only vaguely located. This is more true of the older than of modern plants. More care and forethought is given to modern layouts and the principle of working from a fixed base is becoming more apparent.

Being engaged in one of the large Canadian steel plants where the lack of reference lines is a serious drawback, the writer has been watching with considerable interest the development of a type of permanent base line which is adaptable to any industrial plant.

Important Factors When Fixing Line

In fixing such a line a few important factors should be considered.

First—Permanency is essential.

Second—Its adaption to a location which will at all times afford an unobstructed view between at least two monuments.

Third—The line should at all times be accessible for both measurement and instrument work. In this case it

FIG. 1—MONUMENT IN ELEVATION

is well to consider future plant extensions when locating monuments. Obviously some of the monuments will be destroyed as time passes, but if a base line is to be maintained, provision should always be made for its re-establishment when necessary.

Fourth—Monuments should be located so as not to be an obstruction. In this case the only remedy seems to lie

in making them flush with the ground, thus not affecting the passage of roadways, tracks, etc. Frequently the only unobstructed territory in a plant is along a track or roadway. In order to allow the placing of monuments in exposed places, such as directly in a roadway, a special cast-

FIG. 2—SECTION OF TOP OF MONUMENT SHOWING CENTER PLUG IN PLACE

ing has been designed to fit into the top, and in which the centre point is placed.

Establishing a Base Line

The following sketches and descriptions should give the reader a clear understanding of the methods followed throughout in the designing and establishing of such a base line.

Fig. 1 shows the concrete monument in elevation. The dimension encircled is variable and may be changed to suit local conditions. Fig. 2 shows a large scale section of the top of the completed monument, with the centre plug in place. A section of three-inch pipe, 6 in. in length, is inserted in the bottom of the plate, in which to grout the centre plug after the concreting of the monument has been completed. The centre plug mentioned above is a 3/4-in. round copper rod, 6 in. in length.

Methods of Placing Monuments

The method of locating the line and placing the monuments is as follows: First, the line is fixed on the ground and the location of the monuments marked. In order to facilitate the making of measurements, each monument should be set at some convenient chainage, e.g. an even station plus ten, or a multiple. Should it occur that the above chainage can not be obtained, set at least to an even foot. Then excavation for the monuments is carried down to the required depth. In countries where frost occurs, care should be taken to excavate below the frost line. Footing courses 9 in. thick are poured and the forms for the monument set in place. It is always wise to place a footing course under each monument, as it counteracts any tendency to settle. After the forms are set, they should be carefully lined in and checked for chainage, and the plate, with pipe inserted as shown in Fig. 2 should be placed in its proper position. The drain pipe should also be placed in position, the actual slope given being sufficient to carry off any water which may collect. When this is done, they may be filled with concrete, using a 1-2-4 mixture. Before the centre plugs are finally lined in and centred, time should be allowed for the concrete in the monument to set.

When everything is in readiness for the final work of establishing the line, a small quantity of very rich concrete is prepared and placed in the pipe in each monument. The copper plugs are quite easily driven into this,

lined in with a transit, and carefully set at the required chainage. After the plugs have been thus set, great care should be taken not to disturb them until the concrete in the pipe has sufficiently set to hold them in place, when precise line and chainage may be marked on them. The most convenient centre mark, which answers for both line and chainage, is a cross scratched on the head of each plug with a sharp edged tool. It is wise to make each cross accurately with a pencil first. Great pains should be taken to have all plugs accurately centred, the work being done with an instrument which is in perfect adjustment. Should any doubt be entertained as to the adjustments, the instrument should be reversed on all points given in order to eliminate any possible chance of error. In chaining the distances it is well to check and re-check all measurements with a chain or tape which is accepted as standard. It is especially necessary to re-check all measurements made under unfavorable conditions.

This finishes the work as far as line and chainage go, and now comes the task of running a line of precise levels on the centre plugs. The elevation of each plug should be very carefully noted. In this also great care should be exercised to have all elevations exact, and tied into some accepted bench mark previously set.

The writer has tried to describe the methods employed as clearly as possible, and feels confident that if every plant were to adopt such a means of coping with its engineering problems, of which a great number arise from lack of information, there would be fewer grey hairs in the field engineer's head.

RECENT DEVELOPMENTS IN CONCRETE

SPEAKING before the Montreal Branch of the Engineering Institute of Canada, on April 27, Lieut.-Col. H. C. Boyden of the Lewis Institute, Chicago, in his lecture on "Recent Developments in Concrete," said that until recent years the progress of concrete had been left to constructors supplemented with some laboratory investigation on a small scale. As a result of lack of definite knowledge erroneous ideas had developed, an because of such ideas enormous losses have been caused. In the United States last year, a year not normal in construction, \$1,000,000,000 had been spent for concrete in various forms. Owing to the fact that the fundamental laws of mixing had not been carried out, that work could have been increased in value by 25 per cent., and in his personal opinion, 33 per cent., a loss in value alone of from \$250,000,000 to \$330,000,000. Briefly the owners were not getting what they had paid for.

Col. Boyden then explained the foundation of the laboratory at the Lewis Institute where tests are conducted at the rate of 75,000 a year. The head of the Institute had been given an ample endowment, not to waste, but enough to carry out experiments and investigation until he was able to find the right answer. It was five years before the first investigations were made known. Some investigations had been going on for two years, and the solution would not be arrived at for two or three years and, perhaps ten, but it would mean the right answer and it would not be given out until ready. There was only one instruction given to Professor Abrams, and that was: Find out all about concrete.

Then followed a review of the mixing of concrete, a talk on the ingredients, cement, sand, stone and water, with emphasis laid upon the necessity for clean sand. It was pointed out that dirty sand would lessen the compressive strength of concrete by 25 per cent. While much discussion had taken place about the first three ingredients, the water had been practically neglected, and yet water was the controlling factor in the making of good concrete. This led to a lengthy review of the water-cement ratio. The less water used for a given amount of cement the stronger the concrete. The more water used, the weaker the concrete.

Col. Boyden dealt with the new form of specifications, criticized building codes, and declared that many designers were working on the factor of safety, because they had not the courage to say to the contractors: Give us the proper concrete. Under the new knowledge it is possible to buy concrete as a finished product.

As an example of construction erected under the Abrams specifications, Col. Boyden instanced the new building of the Canada Cement Co. in Phillips square, a \$2,000,000 structure, where the average variation was only 1 3-10 per cent. from the desired result. This he quoted as an example of the manner in which the members of the association are willing to work upon their own ideas.

PRACTICAL ISSUES OF HIGHWAY PROBLEMS

PROBLEMS of the highways formed the central theme of an interesting address delivered recently before the Quebec branch of the Engineering Institute of Canada, by Alexander Fraser of the Quebec Provincial Highways Department. Mr. Fraser touched upon the practical issues of the problem from a two-fold standpoint: 1, the standpoint of the financier and of economy; 2, that of the work itself. The problem of economics was difficult enough. "I can give no better illustration of this fact," he said, "than by pointing to the varied systems and laws governing highways throughout the United States and Canada. The differentiations of the laws arose doubtless in the first place from the differentiations in the systems employed. All of which arose very likely from the difference in point of view upon similar problems."

"Despite these differing points of view, however, and the different systems and laws resulting, it was evident" said Mr. Fraser, "that there was a very marked tendency in one direction. This was on the principle that each one should pay his share toward the expense of making and maintaining highways."

"The chief factors involved in the technical work governing construction are the types of local material to hand, the nature of the soil, with the local conditions governing drainage, the cost of construction, and the facilities offering for future work, the financial means at the disposal of the department, the difficulties from the point of view of the work itself, the nature of the adjoining properties, and the general topography of the vicinity of construction being carried out. It is only by virtue of a thorough knowledge of all these factors that the engineers can finally decide upon the exact location for the needed enterprise."

SOME PROBLEMS IN SURVEYING.

BEFORE the Halifax branch of the Engineering Institute of Canada, at the last monthly meeting, an interesting paper was read by H. B. Pickings on "Some Problems in Surveying" with special reference to the difficulties and embarrassments with which the surveyor is confronted in attempting to reach the necessary degree of accuracy and finally in the delimitation of "lots, pieces and parcels" of real estate and to reconcile errors and discrepancies between ancient and often crudely prepared plans, deeds and descriptions, and present conditions and boundaries of properties. It was difficult and often impossible to find or identify the ancient marks and monuments delimiting a piece of property and therefore correspondingly so not only to adjudicate equitably between a seller and a purchaser, and to satisfy the legal requirements in the often complicated process of transferring property from one owner to another.

In the discussion which followed the chairman expressed the opinion that a vast amount of trouble would have been saved, if in the descriptions of properties by metes and bounds the true or astronomical meridian had many years ago been made compulsory in all surveys, plans, deeds and descriptions of properties, instead of the generally used magnetic bearings which vary from year to year and by local attraction from place to place.

UTILITY OF MODULAR RATIO QUESTIONED

Cracking Said to Resolve Reinforced Concrete Beams Into Trusses — Resistance Columns Calculated Without Reference to Modular Ratio.

DOUBT is thrown upon the generally accepted theory of reinforced concrete so far as it depends upon the modular ratio, by H. Kempton Dyson, in a recent paper before the Concrete Institute. According to the author, the resistance of a reinforced concrete beam arises from its action as a truss rather than as a composite beam, and consequently the value of the modular ratio does not affect the problem. He takes the position, further, that in view of the construction in the concrete of a reinforced concrete column, the resistance of the steel has nothing to do with the modular ratio, but should be figured as that due to a series of short struts.

Effect of Cracking.

Mr. Dyson advances the view that although cracks in properly designed reinforced concrete beams are very small, the structures are really compound ones in which the concrete and steel act as separate elements, though connected together. Thus, in reality, such a member is not a beam—it is more in the nature of an arch or elemental frame. The manner of behavior of a characteristic beam loaded at two points is indicated in Fig. 1. The dotted lines represent the compression struts which are virtually created in the concrete of the beam, forming, as it were, the compression chord and end posts of a truss. When web members are introduced, the construction takes the form of a trussed frame as shown in Fig. 2, this being

Fig. 1—Truss Action of Beam With Two Concentrated Loads

analogous to a Warren girder. The horizontal steel in such construction forms the bottom or tension chord of the truss.

Common Theory Questioned.

The author points out that the ordinary current theory, to which Professors Hatt, Talbot and Withey in America, and Professors Marsch and Bach in Germany, made notable contributions has been in reality adjusted to fit the facts by using a coefficient labelled "modular ratio" so selected as to make the formulae fit the experiments. The view is advanced that we are not sure as to how a so-called beam of reinforced concrete is really going to act and that it may be a kind of arch, a simple frame, or a truss, or in the case of a slab resting on its edges, there may be developed a sort of dome, cone or pyramid within the thickness. The beam theory to be applied to such a condition must of necessity be adjusted to an important extent.

The action of the horizontal steel as a virtual tension chord of a truss is supported by the evidence built up in recent tests that there is a gradual sliding of the bars in the concrete as the loads increase. In accordance with which most of the pull is taken by the hooks or other anchorages at the ends. If, therefore, there is little stress transferred to the horizontal steel in the central portion of the beam, this steel would undoubtedly resemble that in a tension chord.

Distribution of Compression.

If a concrete beam be regarded as a virtual truss the distribution of the compressive stress may be quite different from that commonly assumed. Thus, if horizontal compression is applied to the top chord of a truss below the

centre of gravity thereof, the compressive stress will be higher on the lower edge than on the upper edge. A striking illustration of the possibility of such a distribution over the entire depth of the concrete beam of special form is contained in Fig. 3. Here compressive stress is actually greater at the bottom of the beam than at the top.

Comparative Costs.

The author designs slabs varying in thickness from five to eight inches for an assumed loading in accordance with the ordinary theory and in accordance with his own

Fig. 2—Resolution of Beam Into Virtual Warren Truss

method, assuming for the latter two distributions of the compressive stress, namely the triangular and elliptical distributions. It is found that practically no difference in cost arises for the thicker slabs, but by thinning the slabs and using the author's method there is a considerable saving effected.

Columns.

Exception is taken by Mr. Dyson to the current methods of calculating reinforced concrete columns. He points out that doubts have been thrown in recent years upon the adequacy of the common theory by reason of increasing knowledge of the phenomena of shrinkage and flow under stress. An argument similar to that advanced by Franklin R. McMillan before the American Concrete Institute at its last meeting is put forward. The author holds that the creation of an initial condition of tension in the concrete through shrinkage and a corresponding initial compression in the steel upsets any ideas we may have concerning the stresses in the concrete and steel being proportionate to the ratio of their moduli of elasticity. He declares that so long as adequate precautions are taken to prevent buckling of the steel we may calculate the resistance of a column without paying any attention to the modular ratio and consider it merely as made up through the concrete being able to withstand as much as it would if it were plain concrete and the steel as much as it would in a short steel column. The addition of the two would then represent the total resistance of the reinforced concrete column. A method of proportioning ties to prevent the reinforcing rods from buckling is outlined.

Fig. 3—Distribution of Compressive Stress in Special Beam

According to the theory the ties or links should be spaced not further apart than sixteen times the diameter of the vertical rods for the smaller sizes, and at a reduced spacing for larger rods. He personally adopts as a standard 8 inches throughout for all columns containing rods over 2 in. in diameter.

The Niagara Peninsula Branch of the Engineering Institute of Canada held their annual meeting at St. Catharines on May 5, when the following officers were elected:—Chairman, F. S. Lazier, Thorold; Vice-Chairman, S. R. Frost, Niagara Falls; Directors, F. W. Clarke, Niagara Falls; A. Milne, St. Catharines and Mr. Downey, Thorold.

THE SUB-SOIL OF MONTREAL*

Character of Rocks, Gravels and Clays Underlying Montreal
— Nature of Sub-Soil and its Suitability for Building
Sites—Application of Geology to One Determination

By Adhemar Mailhot,

Professor of Geology, Polytechnic School, Montreal.

GEOLGICAL formations of the sub-soil of Montreal are divided into two groups, the first belong to the Paleozoic era with which are connected the formations of solid rock that constitutes the substratum of the island; the second comprises the deposits of the Quaternary era, that is to say, the deposits of the Pleistocene and Recent epochs. The rocks of the first group are geologically very old, and since the day of their formation they have been consolidated into rocks sufficiently coherent to be utilized as building materials without undergoing any treatment other than dressing. The formations in the second group, on the contrary, are in practically the same condition as when they were formed. The deposits of these two divisions are, consequently, very different. At Montreal there is no evidence, either of the later part of the Paleozoic era or of any part of the Mesozoic and Cenozoic eras. If deposits were formed during these periods, they were completely carried away by erosion, and there is now a gap between the Devonian and Pleistocene periods.

The consolidated sedimentary formations which form the sub-soil of Montreal belong to the Cambrian and the Ordovician, two subdivisions of the Paleozoic. These formations occur in the following order beginning with the oldest:

1. The Potsdam Cambrian sandstone which rests directly and unconformably on the pre-Cambrian complex is 429 ft. thick at Saint-Canut and more than 1000 ft. thick at the wells of the Gas Co. at Montreal.

2. Above the sandstone are the following Ordovician formations. Beckmantown or Calciferous (sandstone), 1065 ft.; Chazy (limestone), 785 ft.; Trenton (limestone), 695 ft.; Utica (shales), 210 ft.

If you were to sink a shaft somewhere at Point Saint-Charles you would meet with all these formations in turn. These rocks form bands very nearly parallel to the Laurentian border, somewhat after the manner of a deck of cards, the first card, underneath, would represent the Potsdam sandstone, the next the Beckmantown, the third the Chazy, the fourth the Trenton, and the fifth the Utica shales.

Evidence of Volcanic Activity

Towards the end of the Devonian period, at the time when the preceding formations were laid down, the plain of the St. Lawrence in the vicinity of Montreal must have been the theatre of great volcanic activity of which we have proof today in the line of igneous hills which extend from Mount Royal to Mount Shefford. These hills, of reduced size, represent the bases of these early volcanoes, or in some cases, laccoliths, uncovered by the subsequent erosion, which acted continuously on the geological formations of the valley of the St. Lawrence from the Carboniferous era to the Pleistocene or Glacial period.

The igneous mass of Mount Royal occupies a surface of 1½ square miles; it is surrounded by the Trenton limestone, through which it has opened a passage. The principal part of the mountain is formed of *Essexite*, a dark coarse-grained rock somewhat like a granite. Later this *essexite* was cut by an intrusion of *nepheline syenite*, a rock which is of similar origin to the former; it represents a more acid phase of the primitive magma. The *nepheline syenite* occupies a relatively wide band on the north-west side of the mountain, and elsewhere on the mountain it forms little isolated patches. It is a rock of finer grain and lighter in color than the *essexite*.

Associated with these intrusions there are a great variety of dykes, that is to say, walls of igneous rock, more

or less inclined or vertical, that cut, in all directions, the *essexite* the *nepheline syenite* and the surrounding sedimentary rocks. There are also numerous beds of similar composition, intercalated between the layers of the stratified rocks. These dyke rocks are also, in origin, connected with the *essexite* and *nepheline syenite*; they bear such names as *bostonite*, *camptonite*, *ainoite*, *tinguaita*, etc. They represent the last phase of volcanic activity in the Island of Montreal. You meet with these dykes wherever there are extensive outcrops of rock in the neighborhood of Mount Royal as in Mount Royal Park, in the Mile-End quarries, at Outremont and at St. Helene Island.

The different formations that we have just described formed the surface of the Island of Montreal before the Pleistocene or glacial period. This surface was much more hilly than it is now, and it is owing to the deposits of the Pleistocene and Recent epochs that the surface of Montreal Island is as level as it is now. Outside of Mount Royal the most important topographical variations are the two patches of *leda clay*, surmounted by the *saxicava* sands at the western extremity of the island. In addition there is the escarpment cut by the St. Lawrence which, in general, parallels the Grand Trunk Railway from near the village of Pointe Claire as far as the city of Montreal and even beyond to Pointe aux Trembles.

Mount Royal.

Mount Royal itself owes its elevation above the surrounding country to the fact that the rocks *essexite* and *nepheline syenite* that form it, are harder and more resistant than the Trenton limestone through which they have penetrated. Mount Royal might be compared to a knot in the floor of the valley of the St. Lawrence.

The deposits of the Pleistocene and Recent periods, that are commonly called the "drift" formations, may be classified in the following way, in descending order.

Recent period—River gravels. Lacustrine deposits, comprising lacustrine clays, shelly marls and peat.

Pleistocene or Glacial period—*Saxicava* sands and gravels, with glacial deposits. *Leda clay*. Boulder clay.

Pleistocene or Glacial Period.

Boulder clay is in a general way, a mixture of fragments of rock, in which the sides of the fragments may vary from blocks weighing several tons to the finest dust. The coarsest fragments are generally pretty well rounded and frequently present striae on one or several faces. These striae are characterized by stones which form the glacial moraines. The fragments are imbedded in a compact, fine grained clay, without any regular distribution.

This boulder clay covers almost the whole of the Island, although in some spots it in turn is covered by the more recent formations of the Pleistocene. With the exception of the Paleozoic outcrops on Mount Royal and around it, the boulder clay covers the rocky crest that occupies the centre of the island. In the northern part of the island it is generally of no great thickness, and even disappears completely around the rocky escarpment that follows closely the line of the river at a short distance from the latter, from Longue Pointe towards the north as far as the chapel of the Reparation, near the end of the Island, turns towards the West by Des Prairies River and extends to the Bas du Sault, thus allowing the Trenton limestone to crop out on almost the whole length of this strip in the form of a horse-shoe.

The surface of the boulder clay is very uneven. When it crops out it is owing to erosion, and then the surface of the formations seems to us fairly regular, but the surface of the boulder clay on which the *leda clay* was deposited, was irregular. This fact is well illustrated at the factories of The Terra Cotta Lumber Co., at Lakeside, where the *leda clay* has a depth of 26 ft., while the railway, close beside it, rests on the boulder clay.

Leda Clay

The *leda clay* is a gray or bluish gray clay, presenting at times a sort of stratification. It contains marine fossils, among which the most characteristic is the *leda glacialis*.

*Paper read at the Town Planning Convention, Montreal.

whence it takes its name; consequently it is a deposit which was formed at the bottom of the sea. The leda clay often contains beds of gray sand which accentuate its stratification. In the upper part of the leda clay these beds of sand become more and more numerous and they are often rich in to Villeraie, covering the greater part of the districts of organic remains, especially in shells of lamellibranchs. The leda clay may, then, be divided into two parts, the lower one-clayey, with few fossils, containing only shells of the leda glacialis and inaccomma greenlandica, the upper one, sandy, containing a rich boreal fauna. The largest area of leda clay on the Island of Montreal occupies the whole of the northern extremity of the Island from the Bas du Sault, to Bout de l'Île, along the Prairies River, and from the Bout de l'Île, to Maisonneuve along the River St. Lawrence. It penetrates also into the city of Montreal and forms the escarpment which supports the saxicava sands, which escarpment extends from Maisonneuve to Guy Street along Sherbrooke Street. This area of leda clay extends towards the north through Lafontaine Park to the vicinity of the old Mile-End quarries, and occupies also the present site of the Angus Works as far as Rosemont Boulevard. There is still another strip of no great extent at the outskirts and to the west of Westmount Station as far as Montreal West. Finally, other isolated strips are found between Blue Bonnets race-course and Montreal Junction, on the shore of Lake St. Louis, near St. Anne de Bellevue, Senneville, etc.

Saxicava Sands and Gravels

Under the heading saxicava sands and gravels are included all the beach deposits which are formed of sand colored yellow by oxide of iron, or coarser, yellow or brown sand containing still rounded stones, (up to a foot in diameter), and containing shells in greater or less abundance such as the saxicava rugosa, whence this layer derives its name.

The croppings out of the saxicava sands form an almost continuous stretch which extends from Montreal West Notre Dame de Grace. Cote des Neiges and Outremont. In addition we meet with wide strips occupying the summit of the terrace of Sherbrooke Street from McGill University to Maisonneuve, with the exception of Lafontaine Park, where the leda clay crops out. The thickness presents variations from a few feet up to 20 ft. and more on the west side of the mountain. At the cemetery of Cote des Neiges it attains 30 ft.

River Gravels

There is a wide strip of coarse river gravel which follows the right bank of the Prairies River from the Bas du Sault to about two miles to the west of the village of Carterville. This strip has an average width of about $\frac{1}{2}$ mile. This gravel, as a general rule, rests on the boulder clay, but also, sometimes, on a thin bed of leda clay. There is another strip of gravel $\frac{1}{4}$ mile wide by $1\frac{1}{4}$ miles long, on the south-east side of the Lachine Canal, to the west of St. Paul Boulevard.

Deposits of Drained Lakes

The most recent natural deposits of the Island of Montreal consist of stratified clays, shelly marl, and peat, which have been deposited on the bottoms of lakes which have been drained since the occupation of the country by civilized man.

There are little strips of lacustrine deposits along the aqueduct, near the Lachine Rapids, these deposits being formed of shelly marl covered with peat and also by stratified lacustrine clay underneath the marl.

The largest of the lakes of Montreal Island called in geology, Lake Turcot, extends from the station at Montreal West on the Grand Trunk Railway, as far as the Cote St. Paul road. There was also at one time a lake in the course of the Molson stream at Vieuxville. Finally peat along with marl is found on the Cote St. Michel road.

Sub-Soils and Building Sites

The character of the sub-soil should guide us in part, at least, in the choice of a site for a building. The sub-

soils that are to be met with in Montreal and its vicinity are. 1. Boulder clay. 2. Leda clay. 3. Sand. 4. Gravel. 5. Solid rock. The boulder clay and the leda clay will give damp cellars and it is absolutely necessary to provide for the installation of a good system of drainage under the foundations.

The sand and gravel will provide dry cellars if the drainage underneath is satisfactory, which is the case, it may be said, for the most part, in regard to the sand and gravels of Montreal Island. It is to be noted that if the sand and gravel rests on a bed of clay, in the form of a basin, a sheet of stagnant water will probably be formed on the clay. Such conditions may be injurious to health, in fact it is to such conditions that they have attributed, in London, the propagation of phthisis in certain districts. The same results would evidently follow in the case of foundations set on boulder clay or leda clay, if the drainage conditions were not good.

As for the stability of a foundation, the solid rock is the ideal, but, nevertheless, boulder clay, because of its compact nature, is almost as good, after it has settled. Foundations on gravel are also generally very safe for dwelling houses, but if there is a substratum of leda clay in a spot, it is dangerous. The numerous fissures which have appeared of late years in dwelling houses and other buildings erected on leda clay, between St. Catherine and Sherbrooke Streets, and between Metcalfe and University Streets, are sufficient proof that we should avoid leda clay for the foundation of a residence.

The character and the depth of the drift are of great importance in the case of large buildings or important works of civil engineering. One must remember that it is always possible to meet with moving sands in the drift, as, for example, in the boulder clay. In some cases it is necessary to start the foundations of a building on the solid rock but often, when the sub-soil is favorable, this is not necessary.

In the lower part of the city of Montreal, let us say below Sherbrooke Street, the rock is found between 20 and 75 ft. or more from the surface, but the boulder clay generally constitutes a bed sufficiently safe for most buildings when it contains no lentils of moving sand.

When gravel or leda clay covers the boulder clay it becomes necessary to sink pillars of wood or concrete at least as far as the boulder clay, or what is still better, as deep as they will penetrate.

When the boulder clay contains lentils of moving sand, it becomes necessary to sink caissons under compressed air at sufficient pressure to prevent the moving sand penetrating into the caisson, until the solid rock has been reached. One can then rest the foundation directly on the latter.

Rock Contour Line

The depth of the solid rock in the city of Montreal is a question of the utmost importance from the point of view of choosing a site for a large building. The figures that M. J. Stanfield compiled for the Geological Survey of Ottawa, and which he obtained from the different municipal technical services of the cities of Montreal, Westmount, Outremont, Montreal West, etc., enabled him to make the following generalizations.

The contour line 10, that is to say the line that follows the solid rock at a depth of 10 ft., envelops Mount Royal in the following direction. If one starts from a point about 200 ft. south of Masson St. on Boulevard Pie IX, this line traverses the Angus works, follows closely Mount Royal Avenue, passes slightly to the south of this street in the vicinity of Papineau Avenue and follows this direction as far as Saint-Denis Street, from there it bends towards the south and comes out nearly at the corner of Pine Avenue and Park Avenue; from this point it passes to the corner of Milton and University Streets, and from there it goes towards the corner of Peel and Sherbrooke Streets; then it follows, approximately, Sherbrooke Street as far as Atwater Avenue, where it passes a little to the north of Sherbrooke Street and continues thus along the Cote St. Antoine Road to about Roslyn Street in Westmount; from there it turns almost at a

right angle towards the north, and reaches, zigzagging, and rounding the mountains, the village of Cote des Neiges; from there it reaches and follows the line of the Canadian Pacific Railway to the vicinity of Park Ave. and Van Horne Street, and then, making a deviation of 90 deg. goes towards the north-west, and envelops the village of Youville.

In a general way it may be said that inside this contour line, the rock is found at a very slight depth from the surface, and that consequently this part of the city is well adapted to the erection of large factories, office buildings or large departmental stores, which require a firm and solid foundation. Such large buildings could be erected at a much lower cost for the foundations than the majority of similar buildings that would be erected between this line, as it has just been traced, and the River St. Lawrence. Greater stability and less capital invested should be the strongest reasons that can influence the choice of a site within the region that has just been described, for the future erection of several large buildings.

Geological conditions enable us to foresee that the district between Park Avenue and Iberville St., from Mount Royal Avenue to Mile-End station, and beyond will become a few years from now an important commercial and manufacturing centre.

Immediately to the south of the line just traced from Boulevard Pie IX to Westmount, the rock dips rapidly, so that if one were to remove entirely the drift formations from the surface along this line, one would obtain an escarpment 30 ft. and more in height at almost all points. That is to say that the contour line 30 follows closely that of 10. We must, however, make an exception of a stretch just to the north of Ontario St. from about Moreau St., as far as a point to the east of Boulevard Pie IX, where the solid rock crops out at the surface.

In a general way, in the city of Montreal, the depth of the solid rock beneath the surface increases gradually as it nears the river; this fact is well illustrated on University Street; at the corner of Milton Street the rock is found at a few feet from the surface, while 300 or 600 ft. farther south the rock is found about 50 ft. beneath the surface. From the eastern extremity of the Lachine Canal and to the south of St. James, Craig and St. Catherine Streets, in the east of the city, the rock is found at depths of between 60 and 90 ft.; however, there seems to be a rocky crest that is not so deep, where the rock is found at depths varying from 12 to 26 ft., along Bleury Street between Laguchetiere and Ontario Streets, this crest having a width of about ½ mile. This section in the lower part of the city would seem to be the most favorable for the construction of foundations on the rock.

Rock Slopes Toward River.

In a general way it may be said that the surface of the solid rock has a gradual slope towards the river from the rocky plateau that encircles Mount Royal, a slope which may be compared to that of the present or actual surface, in the same district.

That is what the present knowledge of the geology of Montreal can teach us as to the nature of the sub-soil that one may expect to meet with in excavating for a foundation. It is unnecessary to add that this data is not complete.

With regard to this matter, I shall venture to suggest to the municipal authorities the creation, for the city of Montreal, of a geological bureau connected with the public works departments, this bureau, to have as its object, the compilation of data relative to the sub-soil of the city, the interpretation of the results of underground borings and the making of a detailed geological map, on a large scale, of the city of Montreal and vicinity.

In conclusion, I venture to suggest that the municipal building regulations should take into account the geological conditions of the sub-soil of the city of Montreal; one should, for example, reserve certain districts, where the conditions are most favorable, for the erection of factories and large buildings, concentrate dwelling houses on sites formed of sands and gravels, where it is possible to have solid enough foundations, and where there will be no reason to

fear damp cellars, and finally, to set aside for amusement parks, the areas covered with leda clay, which as a rule are not favorable to the erection of dwelling houses.

ONTARIO HIGHWAY PROGRAM

When discussing his Highway Improvement Act before the Ontario Legislature on May 9, Hon. F. C. Biggs, Minister of Public Works and Highways, gave a comprehensive survey of the Government's highway program to the end of 1924.

The program which he submitted to the House was inclusive of the work done since the inception of the present provincial highway plans in 1918, and consequently a considerable portion is already complete, and expenditures totalling \$18,300,000 made. With these inclusions, the program calls for a total expenditure of approximately \$55,000,000 by the end of 1924.

Mr. Biggs explained that the plans outlined would not put the whole 1,812 miles in a "a state of perfection," but would put them in a condition to bear the traffic upon them. Of the fifty-five millions, \$49,920,000 was required for roadways, \$5,000,000 for bridges and culverts, and \$3,079,000 for connecting links in unseparated towns and villages.

Of the total amount, the Minister figured on securing \$10,000,000 from motor licenses; \$4,500,000 from Federal grants, \$10,000,000 from the twenty per cent. assessments paid by the counties, and \$3,200,000 from the cities as their twenty per cent of the cost of suburban area roads. This would leave \$27,500,000 to be raised by the province.

The amount would be expended as follows: In township grants, \$2,000,000; in county grants, \$15,000,000, and on provincial highways, \$38,000,000.

The program for the suburban areas constructed called for 149% miles of concrete, 150% miles of asphaltic concrete, 6% miles of asphaltic concrete, using gravel aggregate, 22 miles of oil penetration, and 2½ miles of gravel, involving a total expenditure of \$16,704,000.

For the whole 1,812 miles the types were: Concrete, 205.67 miles; asphaltic concrete, 189.06 miles; asphaltic concrete with gravel, 27.96 miles; oil penetration, 167.57; oil macadam, 343.01, and gravel, 876.73.

Mr. Biggs spoke of the advantageous prices which were being quoted by contractors this year, stating that on 131 contracts let so far this year, the prices were probably 15 per cent. below last year's figures. The number of tenders was very large, and the competition keen.

He alluded to the effort being made to beautify the sides of the highways by planting trees and establishing parking places for the benefit of visitors and natives, as well, regarding the results as more than justifying the money spent.

GOOD ROADS LEGISLATION IN QUEBEC

IMPORTANT amendments have been made to the present good roads legislation. Provision is made for a new department called the "Maintenance of Roads Bureau," to be directed by a general superintendent, having authority to fix roads in backward municipalities and charge the cost. The bill also provides for a petition from the Municipality to the Department to carry out all the maintenance work, on a 50 per cent. basis, or even more, if the circumstances warrant it. Another feature worth noting is the amendment which brings all village streets under the same jurisdiction as township roads, and thereby permits them to share in the government grants, and benefit by department inspection and standards.

The Town Planning Commission recently formed for Montreal, will, it is understood, comprise, James Ewing, Professor Alex. Farley and Dr. Atherton, with Jules Crepeau and S. Fortin as ex-officio members.

STANDARDIZED SPECIFICATIONS FOR MINERAL AGGREGATES FOR ASPHALT PAVEMENTS*

Not Desirable to Have Too Rigid Specifications for Aggregates — Sheet Asphalt Paving Mixtures — Proposed Asphalt Concrete Specifications

By Roy M. Green,
Manager, Western Laboratories, Lincoln, Neb.

MANY of the other details involved in arriving at satisfactory standard specifications for the construction of the various types of asphalt pavements are much simpler of solution than that of drawing up a suitable standard for the requirements of the mineral aggregates which might be universally adopted. For example, the asphalt cements that have been successfully used for the various types of work have been classified and placed in suitable groups for description in specifications and their physical properties are carefully controlled by the producers. Since the physical and chemical properties of the asphalt cements that have been used successfully are known, and there are relatively few producers of such materials, it is much easier to arrive at a suitable specification for them than is the case with the mineral aggregates where there are just as many different classes of materials as there are deposits of rock and gravel and their properties cannot be controlled further than to regulate the maximum size of the particles and the variation in sizes. Realizing these facts, it is readily appreciated that the materials available for use for any type of pavement in the different sections of the country will vary through a wide range.

Flexible Specifications Desirable

Since it is always desirable to obtain the best material in each locality, if it can be done economically, it is impossible to draft a standard which will be suitable for all parts of the United States. For these reasons, the writer believes that the standardization of specifications for the aggregate to be used in the various asphalt pavement mixtures should not be arbitrarily drawn, especially since there is a tendency of many engineers to adopt standard specifications blindly without regard to local conditions of supply or local experience with materials that have been used successfully. A standard specification for aggregate is of no value except as a guide in drafting specifications for local conditions and as a means of pointing out to the average engineer those points which should be taken into consideration in the description of materials desired for a specific purpose. The adoption of a standard specification, in its entirety, often shuts out some local material of considerable merit, and in some cases may entirely shut out a type of construction by placing unnecessarily rigid requirements on certain materials that are essential for that type. In other words, standards for the requirements of the physical properties of aggregates should be based upon the materials available in any locality and should be drawn so as to admit all aggregates that have proven successful in like construction in the past, and should be strict enough so that all materials that have proven inferior are excluded.

In the discussion of this subject it is, therefore, my intention to discuss the physical properties that are essential to the success of the various aggregates for use in the different types of construction. The definite limiting test requirements given in the following pages are not intended for universal application but are what I consider as good practice for the materials available for use in Nebraska and adjoining states.

Since the properties of the mineral aggregate which are essential to the success of a bituminous wearing surface mixture are dependent upon the type of mixture which is contemplated, it will first be necessary to designate the types which are to be discussed.

*Paper read at the American Road Builders' Association Convention, Chicago.

For the purpose of this paper, the asphalt paving mixtures will be divided into four classes, as follows:

1. Sheet asphalt wearing surface mixtures.
2. Asphaltic concrete, with the material passing the 10-mesh sieve predominating.
3. Asphaltic concrete, with substantial proportions both passing and retained on the 10-mesh sieve.
4. Asphaltic concrete, with a preponderance of material retained on the 10-mesh sieve.

Asphalt Wearing Surface Mixtures

The function of the aggregate in a sheet asphalt wearing surface mixture is simply to furnish a medium whereby a high percentage of bitumen may be carried and still produce a mixture with density sufficient to prevent the entrance of water, toughness and elasticity sufficient to prevent cracking and spalling of the surface, and rigidity sufficient to prevent rolling and waving.

Through a long experience with this type of mixture it has been learned that this sort of a combination can best be produced by means of a mixture of properly graded sand, with the addition of a suitable amount of Portland cement or stone dust. Any properly graded sand that is made up of particles of sufficient toughness will meet the requirements for sand for this type of construction provided it is clean and does not contain too much material passing the 200-mesh sieve. The Portland cement or limestone dust is simply added to fill the smallest voids in the aggregate combination, thus promoting stability, and to increase the toughness of the mixture through the fact that the asphalt cement is absorbed by this aggregate to a very large extent. Experience has also shown that very fine sand, in large amounts will not replace the Portland cement or limestone dust as a filler but it is in fact undesirable. This point should be covered by the specifications.

Since the finished product desired for this type of construction is known, it is not necessary to specify the grading of the sand desired and subsequently repeat this in the specifications for the finished mixture, as is often the custom.

This being the case it is only necessary to specify that the sand shall be clean, hard, and durable, the grading being given in the formula for the finished mixture. The amount of material passing the 200-mesh sieve should be limited. The description of the sand could be, as follows, in the specifications.

Specification for Sand

The sand for the wearing surface mixture shall consist of clean, hard, durable grains, free from clay, loam and other foreign matter. Not more than 6% of the sand for the wearing surface mixture shall pass a 200-mesh sieve and it shall be so graded as to produce a wearing surface mixture as hereinafter specified under "Composition of Wearing Surface Mixture" when combined with the mineral filler and asphalt cement.

Since the mineral filler in the mixture adds to its toughness by assisting in retaining a larger proportion of bitumen, by absorption, it is essential that it be fine enough to act as a true filler. The description of the filler could be given in the specifications as follows.

Mineral Filler. The mineral filler shall consist of limestone dust or Portland cement, which when tested by means of laboratory screens shall meet the following requirements:

	Per Cent.
Passing 40-mesh sieve	100
Passing 200-mesh sieve, not less than	75

If this type of specification is used for the mineral aggregate it then becomes necessary to give a complete formula for the desired finished product. The following is suggested as being suitable for this purpose.

Composition of Sheet Asphalt Wearing Surface Mixture. The materials entering into the wearing surface mixture shall be combined in such proportions as to produce a mixture conforming to the following limits of composition, by weight.

	Per Cent.
Bitumen	9.5 to 12
Aggregate.	
Passing 200 mesh sieve	10 to 16
Passing 100-mesh and retained on 200-mesh sieve	5 to 20
Passing 80-mesh and retained on 100-mesh sieve	5 to 20
Passing 40-mesh and retained on 80-mesh sieve....	20 to 40
Passing 10-mesh and retained on 40-mesh sieve	15 to 45

The finished mixture shall have not less than 30% of aggregate passing the 80-mesh sieve.

Although these specifications have been reduced to a very simple statement of requirements it must be understood that the aggregate grading must be carefully controlled, within the limits given, by some one who is competent to supervise this type of construction.

Asphaltic Concrete, with the Material Passing the 10-Mesh Sieve Predominating

In this type of construction, which includes the Topeka mixture, a small amount of stone is introduced in the mixture of fine bituminous mortar. The purpose of this stone in the aggregate is simply to reduce the cost of construction by reducing the surface area to be coated by the asphalt cement, since it requires much less bitumen to thoroughly coat the stone which is replacing a like volume of fine aggregate. The stone, or large aggregate in this type of mixture does not contribute to its stability in any way as each particle is completely surrounded with the fine bituminous mortar and the larger particles are never in contact with each other. The success of such a combination is then dependent upon the correct proportioning of the finer particles of aggregate the same as in the case of the sheet asphalt wearing surface mixture. For this reason it is just as essential to produce a properly graded material having the same physical properties as the material used for the fine aggregate in the sheet asphalt. The specifications for the sand to be used in this type of construction should, therefore, be the same as for sheet asphalt.

The large aggregate is exposed in the surface of the pavement over a relatively small area of the total and it is therefore not so essential that the particles be as tough and hard as for use in mixtures where a very large area is exposed in this way. It is also absolutely essential that the maximum size of these particles should not exceed $\frac{1}{2}$ in. in diameter as they are entirely surrounded by a bituminous mortar and if the size is great there will be a much greater tendency for movement in the mixture, due to stresses at their edges.

In drawing specifications for the aggregate entering into pavements of this class it is well to specify limits of toughness and resistance to abrasion as well as requirements for cleanliness and a limit to the maximum size. The properties of the local materials that have been successfully used should be kept in mind in order that those materials that have given satisfactory service may not be eliminated by requirements that may be too strict. If this type of mixture is contemplated the following specifications for the coarse aggregate are suggested.

Stone. The crushed stone shall be produced from rock having a French coefficient of wear of not less than 8 and a toughness of not less than 8 when tested in accordance with the methods described in the U. S. Department of Agriculture Bulletin 347, pages 4 and 11 respectively. The crushed stone shall be reasonably uniform in quality and free from soft or disintegrated particles and shall vary from $\frac{1}{2}$ in. to the smallest particle retained on the finest mesh screen commonly used in stone crushing plants.

The specifications for sand and mineral filler should be the same as for sheet asphalt wearing surface mixtures as they serve a like purpose in this type of construction and should therefore be identical.

When this type of specification is used to describe the aggregates it is then essential to give a complete description of the formula for the completed mixture. A good

specification, and one which is in very common use is as follows:

	Per Cent.
Bitumen	7 to 11
Aggregate.	
Passing 200-mesh sieve	to 11
Passing 80-mesh and retained on 200-mesh sieve	10 to 25
Passing 40-mesh and retained on 80-mesh sieve....	11 to 36
Passing 10-mesh and retained on 40-mesh sieve	7 to 25
Passing $\frac{1}{4}$ -in. screen and ret'd on 10-mesh sieve	11 to 25
Passing $\frac{1}{2}$ -in. and retained on $\frac{1}{4}$ -in. screen	5 to 10

Asphaltic Concrete, with Substantial Proportions both Passing and Retained on the 10-Mesh Sieve

When Mixture is Used as a Wearing Surface. When properly designed this class of mixture produces a dense asphaltic concrete with a high percentage of well graded stone, the particles of which are in very intimate contact with each other. The function of the stone in this mixture is to add to the stability of the combination by interlocking, and to reduce the surface area to be coated with asphalt cement and thus reduce the cost of construction. In order to be satisfactory in this aggregate the stone must have sufficient toughness and hardness to resist the internal wear that may be set up in the mixture as well as withstand the shocks of traffic that come directly upon the surface of the pavement. For these reasons it is essential that the stone be harder and tougher than that used in the preceding class of asphaltic concrete.

The mortar surrounding the particles of large aggregate in this combination must be suitably designed and proportioned also, in order that it may protect the large aggregate by holding it securely in place and thus prevent internal wear. The mortar must also cushion the effects of traffic on the surface so that the shocks will not be great enough to completely crush the large aggregate. To accomplish this purpose the sand must be properly graded the same as in the two preceding classes of pavements. The following clause will cover these details.

Coarse Aggregate. The mineral aggregate shall consist of hard crushed stone or an approved mixture of hard crushed stone and gravel for the coarse aggregate. Not less than 90% of the coarse aggregate shall pass a one-inch screen. To the coarse aggregate shall be combined sand or a mixture of sand and fine stone screenings for the smaller sizes. The large aggregate, or that portion of the mineral aggregate larger than $\frac{1}{4}$ in. in diameter shall be composed of stone or gravel, all of which has been produced from materials having a French coefficient of wear of not less than 10 when tested in accordance with the methods described in the U. S. Department of Agriculture Bulletin 347, page 4. All the crushed stone larger than $\frac{1}{4}$ in. in diameter shall be produced from materials having a toughness of not less than 10 when tested in accordance with the methods described on page 11 of the U. S. Department of Agriculture Bulletin 347.

The coarse aggregate shall be reasonably uniform in quality and free from soft or disintegrated particles, or other objectionable matter occurring free or as a coating on the aggregate, and free from an excess of flat or elongated pieces.

When this type of specification is used it is necessary to also give the formula for the mixture desired. The following is suggested for this purpose.

Composition of Dense Bituminous Concrete Wearing Surface. The dense bituminous concrete wearing surface mixture, produced in the manner hereinbefore set forth, shall contain the following percentages, by weight, of bitumen and aggregate, the sieves being used in the order named.

	Per Cent.
Bitumen	5 to 8
Aggregate.	
Passing 200-mesh sieve	4 to 10
Passing 80-mesh and retained on 200-mesh sieve	4 to 14
Passing 10-mesh and retained on 80-mesh sieve....	18 to 30

Passing $\frac{1}{2}$ -in. screen and retained on 10-mesh sv. 24 to 35
 Passing 1-in. and retained on $\frac{1}{2}$ -in. screen 20 to 38
 Passing $1\frac{1}{4}$ -in. and retained on 1-in. screen 0 to 10

The finished mixture shall have from 55% to 70% of mineral aggregate retained on a 10-mesh sieve, and not less than 10% passing an 80-mesh sieve.

When Mixture is Used as Closed Binder in Sheet Asphalt Construction. When mixtures of this class are used as closed binder in sheet asphalt construction the combination is made up of a mixture of fine and coarse aggregate with asphalt cement, without the use of the fine filler of Portland cement or stone dust. The function of the coarse and fine aggregates are the same as in the case where it is used as a wearing surface. The large aggregate, however, need not be nearly so tough and hard since the shocks of traffic never come directly upon it and there is no possibility that there will be internal wear as the combination is always protected by a layer of fine bituminous mortar to a depth as great as one or even two inches.

The requirements for the sand should be the same as for other types of construction although the stone may be much softer. A suitable specification describing the stone might be as follows:

Stone for Binder Course. The stone for the binder course shall be produced from tough and durable rock having a French coefficient of wear of not less than 6 when tested in accordance with the methods described in the U. S. Department of Agriculture Bulletin 347, page 4. It shall be reasonably uniform in quality and free from foreign substances. When tested by means of laboratory screens it shall meet the following requirements and be uniformly graded between the limits given.
 Passing 1-in. screen, not less than 95 per cent.
 Passing $\frac{1}{4}$ -in. screen, not more than 10 per cent.

Asphaltic Concrete, with a Preponderance of Material Retained on the 10-Mesh Sieve

When Used as a Wearing Surface. This type of mixture is made up of a commercial size of broken stone or of "one size stone" mixed with a bituminous cement. The mixture produced in this way is not an absolutely dense solid and no attempt should be made to fill the voids with the asphalt cement. The stability of the mixture is almost entirely dependent upon the interlocking of the large aggregate, and the wearing qualities of the surface are almost entirely dependent upon the hardness and toughness of this material. For this reason it is absolutely essential that this material be as tough as possible in order to withstand the shocks of traffic and resist the effects of internal wear which is inevitable when this type of mixture is used.

The limits of the properties of the mineral aggregate that should be specified are dependent upon the amount of traffic that must be carried by the surface. If it is absolutely known that the traffic is to be composed entirely of rubber-tired vehicles and is very light it is safe to allow the use of much softer rock than if the amount and nature of the traffic is unknown or is known to be severe and to consist of a large proportion of iron-tired vehicles. If a severe traffic is contemplated it is necessary that the aggregate should be better than for any other type of asphaltic concrete mixture in as much as the aggregate must be of such quality that it is capable of carrying all the wear of traffic including internal wear and abrasion of the surface.

A reasonable specification for this type of material is that recommended by the American Society for Municipal Improvements in 1917, which is as follows:

Tests. The broken stone shall be subjected to abrasion and toughness tests conducted by the engineer in accordance with methods adopted by the American Society for Testing Materials, August, 1908. The broken stone used for the construction of the wearing course shall show a loss on abrasion of not more than 3.5% or a French coefficient of wear of not less than 11.5 and its toughness shall not be less than 13.0.

Mixture Used as Open Binder in Sheet Asphalt Construction. If this class of mixture is used as an open binder

for sheet asphalt construction the requirements of the aggregate are the same as for the aggregate for closed binder, already described.

In conclusion I wish to again draw your attention to the fact that it is not good policy to recommend, for universal adoption, a specification for the mineral aggregate for asphalt pavements and place limiting test requirements on these materials because of the fact that materials differ so widely in nature in different localities. It is always advisable to draw specifications for materials so as to allow the use of only the best materials available in any locality so long as competition is obtained and the interests of economy served. While the specifications quoted are not intended for universal adoption it should be noticed that the large aggregate should be of better quality for the cheaper types of construction than for the more expensive, the last form of asphaltic concrete requiring the best large aggregate while sheet asphalt binder and also "Topeka" may be constructed by the use of a poorer grade of stone.

For successful results with any specifications it is also absolutely essential that the mineral aggregate grading be controlled within very narrow limits by one who understands the fundamental principles underlying the various asphalt paving mixtures and who is experienced in their construction.

NEW BRIDGE OVER SYDNEY HARBOR

SYDNEY (Australia) Harbor bridge, in connection with which J. J. C. Bradfield, the chief engineer of the project, is at present visiting Canada, will be constructed from Dawes Point on the south to Milson's Point on the north.

The total length of the main bridge and approaches is 3,816 ft., centre to centre of abutments, measured along the centre line of the bridge, which is straight except for a curve of eight chains radius in the northern approach. The main bridge is to consist of steel cantilevers spaced 98 ft. 6 in. apart, with shore and harbor arms each 500 ft. long, the harbor arms to support a central span 600 ft. long. The clear span from centre to centre of the main piers is to be 1,600 ft. The cantilevers and the suspended span are to be "M" braced, with each main panel divided into four. Between the main trusses the bridge is to carry four 4 ft. 8½ in. railway tracks, each spaced 12 ft. apart centre to centre, with a side clearance of 7 ft. 6 in. from the centre of the outermost track to the nearest portion of the structure; and also a roadway 35 ft. wide between curbs and protected on each side by a steel lattice hand-rail. Outside the main trusses, and carried on cross-girders cantilevered out, there is to be a motor roadway 18 ft. wide on the eastern side and a footway 15 ft. wide on the western side.

At both the north and south ends there are to be three approach spans, each consisting of four "M" type deck trusses with sub-divided panels, and supporting projecting cross girders to carry the motor roadway and footway. The railways and roads on both the approaches will be on a gradient of 1 in 40, which will be continued to the harbour ends of the cantilever arms, but on the central suspended span they will be level and at a height of 139.52 ft. above mean sea level or standard datum. The suspended span is to have a clear headway of 170 ft. above high water, or 172.52 ft. above standard datum.

The main piers, anchor piers, and piers and abutments of the approach spans are to be constructed in concrete faced with granite masonry. The main piers are erected on foreshores which have been reclaimed, and in founding them the solid rock must be reached by unwatering in a coffer-dam or other suitable means, or by the pneumatic process if necessary, as the centre in the footings below water level must be laid on the solid rock in the dry. The other piers and abutments are well above sea level, and the excavation will be wholly in the dry.

HILLHURST BRIDGE, CALGARY

By John F. Greene

Of C. D. Howe & Co., Consulting Engineers, Winnipeg

COMPLETION of the Hillhurst Bridge in Calgary marks another step forward in the progress of a city, which is consolidating its resources against the inevitable expansion which will accompany the development of Western Canada. After having emerged from the period of mushroom growth, real estate exploitation, dreams of sudden wealth to be acquired from oil, the conservative forward-looking portion of the populace took up the reins, made up a balance sheet in which asset values were based upon earnings, not visions, and adopted a policy of constructing permanent improvements which should satisfy the needs not only of the present, but of future generations.

In the last eight years during a period in which the West has experienced no increase of population, and despite the various vicissitudes of war, inflationary boom and business depression, many such improvements have been carried through. The Centre Street Bridge, a double deck concrete arch structure, approached from the north by a heavy cut and fill, with a grade of less than 4%, made a traffic link between two parts of the city which had been separated effectively by a 15% grade. The Mission Bridge, a concrete arch structure of four spans with a 40 ft. roadway crossing the Elbow River and its islands, has

interesting to recall that a bylaw was passed in 1914 for a steel bridge practically identical with and contiguous to the old bridge, to provide additional traffic way. Upon the completion of the Mission Bridge the sentiment in favor of the concrete arch type of bridge became a settled conviction; the electorate later set aside the original bylaw for a steel structure and voted for a new concrete bridge similar to those which had been constructed. While the structure itself, with its graceful elliptical arches rising in the middle to form one long sweeping arch between abutments, is a good example of its type, the interesting features in connection with the bridge from the standpoint of the engineer or the contractor have to do with the foundations. The new structure standing just below the log dam of the Eau Claire Lumber Company, is subject to unusual flood conditions. A break in the dam, not an unusual occurrence during an exceptional flood, may result in a local concentration of such magnitude as to scour a hole 20 ft. deep in the gravel and shale. Ample evidence of the scouring capacity of the Bow River was available and the foundations were designed in the light of available knowledge.

Piers and abutments rest upon rock at a level approximately 42 ft. below the water in the tail race. Each pier supporting adjacent arches consists of a concrete beam, the shafts running down to rock. The excavation carried down through approximately 35 ft. of heavy gravel and seamy shale, was an undertaking involving much expense

HILLHURST BRIDGE, CALGARY, ALTA.

been the subject of much favorable comment from competent observers, and replaces a light steel highway bridge.

The Calgary Exhibition Board, a municipal undertaking with a business record of which any private corporation might well be proud, has contributed its quota with a large reinforced concrete grandstand seating more than 6,000; an enclosed concrete arena with a seating capacity of 3,000, built principally for cattle-judging contests, but modestly proclaimed by Calgary fans as the best boxing arena in Canada.

These structures, together with the new Hillhurst Bridge, represent expenditures approximating \$1,000,000, and made during a rest period in the growth of the city, offer substantial evidence of the faith of the populace in the future of Calgary.

The Hillhurst Bridge crossing the Bow River at Ninth Street West, is a concrete arch structure approximately 700 ft. long, consisting of five arch spans each 105 ft. long, with piers, abutments and approaches. The arches are of the spandrel fill solid barrel type, with the curve of the intrados a semi-ellipse.

The sidewalks are carried on cantilever brackets, which rest on counterforts, the moment being carried from the brackets through the counterforts to the arch ring.

The site of the new bridge stands several hundred feet east of the steel bridge which it replaces. It may be

and many setbacks. That it was satisfactorily completed is greatly to the credit of the contractors, the Fegles Construction Co., of Fort William. The project together with the other bridges and structures mentioned, were carried out under the direction of George W. Craig, city engineer, with the writer as consulting engineer.—From "Municipal Improvements," published by the Canada Cement Co., Ltd.

ENGINEERING INSTITUTE ELECTIONS

At a meeting of the Council of the Engineering Institute of Canada, held on April 18 in Montreal, the following elections and transfers were announced:

Members—Robert Angus, London; John Dow, Lethbridge; A. C. Selig, Moncton; J. E. St. Laurent, Winnipeg; Ellwood Wilson, Grand Mere, Que.

Associate Members—W. R. Alder, Cornwall; A. J. Ames, Ottawa; A. F. Baird, Fredericton; G. L. Bockus, Sherbrooke; C. H. Brabazon, Ottawa; B. E. Bury, Edmonton; M. D. Cadwell, North Battleford, Sask.; N. K. Cameron, London; S. W. Canniff, Ottawa; F. J. Clark, Lethbridge; S. H. Cunha, Montreal; J. C. Donald, Fernie, B.C.; O. W. Ellis, Toronto; R. H. Field, Ottawa; J. A. Forgues, Cartierville, Que.; G. F. H. Hilliard, Lethbridge; H. P. Keith, Lethbridge; C. C. Lessard, Quebec; Nathaniel Mar-

shall, Lethbridge; J. O. Massicotte, Montreal; H. J. G. McLean, Brantford; W. J. Moffat, Regina; J. M. Moore, London; J. C. Nash, Hamilton; T. H. Nicholson, Montreal; H. A. Small, Kingston; G. B. Snow, Chicoutimi, Que.; J. H. Summerskill, Montreal.

Juniors—Herbert Aldous, Toronto; J. W. G. Boyd, Toronto; M. G. Henderson, Lethbridge; Kenneth MacKenzie, Winnipeg; F. L. Mitchell, Iroquois Falls; Alexander Thomson, Lethbridge.

Transferred Associate Members to Members—H. A. Brazier, London; J. L. Busfield, Montreal; C. W. Cornell, Toronto; F. A. Dallyn, Toronto; E. E. Hawkins, Avonmouth, England; C. D. McT. MacKintosh, Lethbridge; Patrick Philip, Victoria; H. T. Routly, Toronto; A. E. Sharpe, Leader, Sask.; A. C. Wright, Ottawa.

Transferred, Juniors to Associate Members—D. C. M. Davies, Regina; F. P. Flett, Windsor; Sifroy Goulet, Peterborough; P. M. H. LeBlanc, Ottawa; E. N. Lyon, Bombay, India; N. G. McDonald, Oshawa; R. C. McKnight, Owen Sound; F. G. Rounthwaite, Tucker's Town; Bermuda; F. C. Rust, Toronto; D. A. White, Montreal; G. H. Wood, Ottawa.

Transferred, Student to Associate Member—J. S. Hall, London.

Transferred, Students to Juniors—Despres Dessane, Quebec; Endore Giguere, Lacine; R. W. Jickling, Winnipeg; W. B. MacIntyre, Toronto; H. D. Rogers, Gananoque.

EFFICIENCY OF TRANSMISSION AERIALS

IN a paper read before the Wireless Section of the Institute of Electrical Engineers says the "Times" Engineering supplement T. L. Eckersley described an attempt to reduce to a minimum the energy losses in the neighborhood of transmission aerials.

A large part of the energy delivered to the aerial sinks into the neighboring ground and is not recovered, and with the object of screening the earth from the electromagnetic effects of the aerial current, experiments were made which consisted in interposing between the aerial and the earth a screen of wires which was used as a counterpoise earth instead of the usual buried earth. Favourable results were obtained, a large fraction of the earth losses being eliminated. There is, however, the drawback that the wires of the screen itself may form an oscillating system, in which under certain conditions oscillations may be set up that will waste energy, and the paper suggested methods by which these losses may be eliminated.

Screens have been successfully employed at large stations such as Clifden, where now only one-sixth of the power is required to produce at Glace Bay signals equal to those produced by the spark station. The practical point is that it is much cheaper to erect a 400 ft. aerial, say, with 40 jars capacity than an 800 ft. aerial with 20 jars, and even cheaper still a 200 ft. aerial with 80 jars. The height rather than the area is the difficulty. If sufficient care is given to the improvement of the resistance, the height of the aerial can be reduced without increasing the power required for a given range.

ALBERTA ROAD DISTRICTS MAPPED OUT

TEN ROAD districts have been formed in the Province of Alberta by the Public Works Department, for the purpose of more satisfactory carrying on future road construction and maintenance programs. Each of these districts will have an average of thirty municipal or improvement districts within its bounds, and over each will be a resident engineer or inspector. These have already been appointed, in most cases from the staff of road inspectors heretofore employed by the department.

The change has been effected with a view to co-ordinating the work of the surveys and construction branches, the intention being that the district engineers shall also be in charge of the survey parties sent out during the season.

A program of work to be carried on under these district

supervisors is now in course of preparation and will be inaugurated as soon as weather conditions will permit. The organization of the work, with the districts covering the entire province, will continue when the highways commission is in operation.

REDUCED FARE TO CANADIAN GOOD ROADS CONVENTION

ANNOUNCEMENT has been made by the Canadian Pacific Railway Co. of a reduction in the summer tourist fares which will affect the cost of attending the convention of the Canadian Good Roads Association, June 13-17, at Victoria, B.C. A rate of \$110.65 has been authorized as the summer tourist fare from Toronto to Victoria and return, limited to October 31. The fare was formerly \$133.30.

PRODUCTION OF STEEL INGOTS AND CASTINGS

IN spite of the advance in the production of pig iron during March, the output of steel ingots and castings was much lower than in February, the total output being only 29,941 tons as against 42,388 tons in the preceding month. The decline was most marked in the production of basic open hearth steel ingots which in February amounted to 40,935 tons, but in the month under review totalled only 28,222 tons all made for the use of the producing firms.

Basic open hearth castings made during the month amounted to 678 tons practically all of which was used by the reporting firms. In February a very small quantity of basic open hearth steel castings was used by the makers but a larger proportion amounting in all to 472 tons was produced for direct sale.

Bessemer castings and electric steel made in March amounted to slightly more than 1000 tons which was a little higher than the corresponding figure for February. A general improvement in conditions in the steel industry was noticed towards the close of the month, although many plants were still operating at considerably reduced capacity.

POWER ALLOTTED ON ABITIBI RIVER

DISPOSITION of a large part of the electrical power stored in the Abitibi River has at last been made, and one of the most important questions affecting the power development in Northern Ontario has been settled. It has been practically decided to reserve the long Sault rapids, representing 60,000 h.p. electrical energy, for future disposition. The Hollinger Consolidated are applying for Three Carrying Places Rapids, where 40,000 h.p. can be developed, and, it is understood, has agreed to make application for this particular power.

The Temiskaming and Northern Ontario Railway, it is further understood, has waived its rights to any powers for electrification or other purposes, on this river, between Iroquois Falls and Tin Can Portage, a distance of 40 miles. It is understood, however, that they will develop a power on the Frederickhouse River for use in electrifying a portion of the T. and N. O. line in the vicinity of Cochrane. It is also understood that the T. and N. O. will seek further reservations of power between New Post, the first objective in their step towards James Bay, and their final terminal at the tide waters of the Atlantic. These reservations will aggregate two lots of 15,000 h.p. each.

The Ottawa branch of the Town Planning Institute held its annual meeting in the Carnegie Library on April 27 and considerable business was disposed of. There was a good attendance, and after the business the members listened to an interesting and technical address by W. P. Cassils, C.E., on "Curves as They Apply to Town Planning," in which he dealt with the difficulties in making curved streets and boulevards and the manner in which they might be overcome.

ANNUAL MEETING OF CANADIAN SECTION OF AMERICAN WATER WORKS ASSOCIATION

Brantford Meeting a Complete Success — Fine Attendance of Delegates — Complete Exhibition of Machinery and Supplies — Names of Delegates and Exhibitors

THOSE gentlemen who were responsible for the arrangements and their carrying out in connection with the annual meeting in Brantford last Friday and Saturday, have every reason to be gratified.

The Business Sessions of the meeting were well attended. Discussion of papers read was full and general while the exhibition was a decided success, there being 21 exhibits of water works machinery and supplies, notwithstanding this was the first occasion upon which such an exhibition had been held in connection with the Canadian meeting. There were 81 delegates registered.

At the time R. C. Harris, Commissioner of Works of Toronto, chairman, called the first session to order, about 60 practical water works men and consulting engineers were present.

C. D. Brown, Walkerville, read the minutes of the last annual meeting which were adopted.

During the reading of a paper by F. A. Dallyn, Engineer of the Provincial Board of Health, on "Government Control of Sewage" (which paper will be printed in an early issue of "The Canadian Engineer") the ballots for the election of officers for the ensuing year were counted. Messrs. A. Milne, of St. Catharines and R. L. Dobbin, of Peterborough, acting as scrutineers.

Mr. Dallyn's paper elicited excellent discussion, those taking part being Messrs. Hanna of Windsor, Milne of St. Catharines, N. J. Howard of Toronto, while J. Clark Keith of Windsor sent in a written discussion.

Officers Elected

At this point Mr. Milne announced the election of officers for the coming year. They are as follows:

Chairman, R. L. Dobbin, Peterborough.

Vice-Chairman, F. A. Dallyn, Toronto.

Sec.-Treasurer, C. D. Brown, Walkerville.

Trustees:

Retiring 1923: N. R. Wilson, Brantford.

Retiring 1924: J. J. Salmond, Toronto.

Retiring 1925: R. H. Starr, Orillia.

Theo. H. Leisen, Chief Engineer of Detroit Water Works and a past president of the parent association was president and addressed the meeting.

Mr. Dobbin's paper describing the new filter plant at Peterborough (which was illustrated and described in the November 3, 1921 issue of the "Canadian Engineer") brought out a great deal of very helpful discussion, among those taking part being Messrs. Leisen, Wynne-Roberts, Milne and Gore.

Inasmuch as it is very likely that the annual convention of the American Water Works Association will be held in Detroit in 1923, it was decided that if that should be the case, then the next annual meeting of the Canadian Section should be held at Windsor, Ont. Should Detroit not be chosen for the annual meeting of the parent body, then the place of meeting for the Canadian Section will be left to the executive committee.

At 5.40 p.m. the delegates were taken by special car to the Brantford Golf and Country Club as guests of the Board of Water Commissioners and tendered a banquet.

Short addresses were delivered by Mayor Parker, City Treasurer Bunnell, R. C. Harris and F. A. Dallyn. In the evening many of the delegates attended the armories and there listened to the band concert rendered by the Scots Guards.

Meeting a Great Success.

Taken altogether the meeting can be considered as a distinct success from the point of view of attendance, genuine interest in the papers and discussions, while the exhibit of water works equipment was decidedly successful. Considering that the Canadian Section has but about

100 active members, it shows how interested the men who supply their needs are when it is stated that no less than 21 of them sent exhibits and representatives to look after them. The exhibition was held in the Palm Room of the Kerby House. As a result of the great interest in this feature of the convention which reflects great credit upon Canadian manufacturers of water works machinery, it is to be hoped that some permanent organization of the machinery men similar to the body known as the American Water Works Manufacturers' Association and which co-operates so successfully with the parent body, may be brought about.

Delegates Present

The following are the names of those who registered: R. O. Wynne-Roberts, Toronto; Jas. J. Salmond, Toronto; G. F. Johnson, Chatham; C. E. Williams, Galt; Wm. A. Doherty, Toronto; A. S. Branstom, London; N. E. Radford, Toronto; W. T. Randall, Toronto; Jas. M. Noble, Toronto; W. S. McGhie, Toronto; O. J. Delaney, Montreal; L. H. Ronnay, Toronto; G. H. Wilkes, Galt; E. F. Hetherington, Galt; H. H. Gee, Toronto; M. A. Schroder, Sarnia; Jas. C. Atwell, Brooklyn, N.Y.; D. M. Hanna, Border Water Commissioners, Windsor; R. G. Niven, Toronto; G. H. Crase, Chatham; N. Bruce Wilson, Galt; A. S. Robertson, Woodstock; R. H. Starr, Orillia Water, Light & Power Commission, Orillia; Jas. Thomson, Hamilton; F. R. Hamilton, Toronto; A. Milne, Supt. Water Works, St. Catharines; C. A. Warder, Supt. Water Works, Niagara Falls; R. Clark, Supt. Water Works, Merriton; N. B. MacPhee, Supt. Water Works, Port Dalhousie; Vincent Voaden, Hydro-Electric Power Com., Toronto; R. C. Harris, Works Commissioner, Toronto; E. T. Austin, Belleville Water Works, Belleville; R. A. Lyons, Hamilton; J. G. Hamilton, Supt. Water Works, Scarboro; J. Wilde, Asst. Supt. Water Works, Scarboro; S. Young, Toronto; F. W. Hndson, Toronto; A. H. Howard, Hamilton; J. S. Clemens, Toronto; C. J. Archibald, Public Utilities Com., Woodstock; Geo. E. Fisher, Galt; Geo. E. Newill, Montreal; Chester Larner, Philadelphia; Ray R. Knight, Toronto; H. S. Philips, City Engineers' Dept., Hamilton; H. Killmer, Chief Engineer, City Water Works, Windsor; R. L. Dobbin, Water Works Supt., Peterborough; L. W. Smith, Galt, Ont.; W. E. West, Toronto; C. W. Schiedel, Waterloo; J. F. Hartel, Waterloo; F. A. Dallyn, Provincial Board of Health of Ontario, Toronto; A. E. Berry, Provincial Board of Health of Ontario, Toronto; A. V. DeLaporte, Provincial Board of Health of Ontario, Toronto; J. VanSchater, Toronto; N. J. Howard, Filtration Plant, Toronto; W. H. Randall, Toronto; F. C. Chadd, Water Works Supt., Tecumseh, Ont.; W. C. Miller, City Engineer, St. Thomas; A. W. Boinley, St. Thomas; C. H. Scheman, Bridgeburg, Ont.; S. S. Gear, Bridgeburg, Ont.; Wm. Gore, Toronto; Theo. A. Lelsen, Detroit, Mich.; C. H. Bromley, Grimsby; W. T. Randall, Grimsby; H. H. Jordan, Brantford, Ont.; M. Pequenalet, Kitchener, Ont.; A. Wilson Bow, Hamilton; L. O. Donnell, Toronto; H. M. Marsh, Hamilton; E. R. Gray, City Engineer, Hamilton; W. B. Redfern, Toronto; E. M. Proctor, Toronto; L. R. McPaul, City Engineers' Office, Hamilton, Ont.; Wm. Storrie, Toronto; F. H. Early, Water Works Supt., Brampton; C. D. Brown, Sec.-Treas. of Canadian Section, Walkerville; N. O. W. Millard, Brantford.

List of Exhibitors

The following Canadian firms were well represented in the Exhibitors' Room which adjoined the room in which the meetings of the convention were held:

Canadian Brass Co., Galt; C. E. Williams, G. E. Fisher; Wallace & Tiernan, Lt., J. Van Benschoten; Jas. Morrison Brass Goods Co., Ltd., Toronto; James Noble; T. McAvity & Sons, St. John, N.B.; W. S. McGhie, O. J. Delaney; Thomson Meter Co., Brooklyn, N.Y.; J. C. Atwell; Canadian Des Moines Steel Co., Chatham, Ont.; G. F. Johnston; Crane, Ltd., Montreal; A. H. Howard; Dominion Steel Products, Ltd., Brantford; H. Jordan; Goldie & McCulloch, Ltd., Galt; E. F. Hetherington, G. H. Wilkes; A. H. Winter Joyner, Toronto; N. E. Radford; Horton Steel Works,

Ltd., Bridgeburg, Ont., C. H. Scheman, S. S. Gear; Mueller Mfg. Co., Ltd., Sarnia, M. A. Schroder; Neptune Meter Co., Ltd., Toronto, W. H. Randall, W. T. Randall; Canadian Austin Machinery Co., Woodstock, Ont., A. S. Robertson; Hoyt Metal Co., Toronto, R. G. Niven; National Iron Corporation, Toronto, W. A. Doherty, F. W. Hudson; Garlock Packing Co., Hamilton, R. A. Lyons; Page Hersey Tubes, Toronto, W. E. Best; Empire Brass Co., London, Ont., A. S. Branstun; Jenkins Bros., Ltd., Montreal, H. H. Gee.

Saturday Morning, May 13

This session was opened by the reading of a paper on "Standardization of Hose Couplings," by Norman R. Wilson, Chief Engineer, Brantford Water Works, which precipitated some very helpful discussion. It was moved and seconded that the matter be brought to the attention of the Canadian Engineering Standards Association.

Prof. Peter Gillespie then presented a most interesting paper on "Manufacture of De Lavand Cast Iron Pipe," illustrated by lantern slides and moving pictures.

This was followed by a paper by Wm. Gore, consulting engineer on "Treatment of Impure Hard Water." This paper will appear in a future issue of "Canadian Engineer."

Mr. Robertson of the Canadian Austin Machinery Co. was the last speaker for the session and showed moving pictures of trenching and backfilling machinery.

Thus ended what was conceded on all sides to have been a most successful meeting of the Canadian Section of the American Water Works Association.

STANDARDIZATION OF HOSE COUPLINGS*

Reason For Large Variety of Coupling Sizes — Cost an Important Consideration — Large Thread For Couplings Advocated — Adapters Recommended For Municipalities.

By Norman R. Wilson,

Chief Engineer, Brantford Water Works.

IN this paper it is not the intention of the writer to deal exhaustively with the subject but rather to open up the subject for discussion from the viewpoint of those interested in water works matters.

The question is constantly being brought to the front with regard to fire departments but the writer has seldom heard it mentioned by water works officials.

There is no doubt that it would be a good thing to have all couplings standardized with regard to new water works installations, especially in the Western Provinces where there are so many new towns which are at the present time and will be in the future, going into the question of the installation of water works and fire protection.

The writer has on many occasions been asked why it is that there are so many sizes of couplings. The answer is a very simple one. The first protection in case of fire engines was by hand operated appliances made locally and each maker had his own threads and sizes to work to usually cutting his own dies. Then came the steam fire engines and the makers of these made their connections to fit the various hose couplings in use. In the same way when water works systems were introduced hydrant couplings were made to conform to the various existing hose couplings.

From a practical point of view the cost of altering all couplings to conform to a common standard would be so great a tax on the municipalities already equipped, that such a thing would be absolutely impossible. Take for instance the City of Toronto with 6,833 hydrants, the cost of changing the hydrants alone would be in the neighborhood of \$35,000 taking the cost of altering each hydrant at \$5. In addition to which, of course, there would be the

cost of altering all hose couplings and providing new caps for the hydrants.

The question would also come up, which department would have to pay for such alteration for though the hydrants are under the control of the water works department, the chief reason for altering them would be for fire protection.

Again the question arises what is the best standard to use. It is generally conceded that the best size of clear opening is the present standard of $2\frac{1}{2}$ in. which brings the question down to two points, namely, outside diameter of thread on the male coupling and the number of threads per inch. At present the diameters range from 3 in. to $3\frac{1}{4}$ in., and the threads per inch from 5 to 8.

A few years ago an investigation of the question was made in the United States when it was found that in the majority of municipalities, the outside diameter was about $3\frac{1}{16}$ in. and the threads per inch from 7 to 8. To suit these a standard was adopted having $3\frac{1}{16}$ in. outside diameter and $7\frac{1}{2}$ threads to the inch.

Such a thread in the opinion of the writer, is not a suitable one. In case of a fire, the main object is speed and so small a thread is very liable to cause delay by cross threading. This very frequently occurred when the writer was conducting speed tests. The larger the thread the less liability there is to cross threading and the writer has no hesitation in stating that in his opinion the best thread to use is 5 to the inch. With such a thread there is practically no chance of cross threading and it can readily be attached either in the dark or in winter.

Further it is much more readily cleared of dirt or ice than a small thread and is much less liable to breaking or burring than a fine thread.

The simplest and least expensive method for existing municipalities to adopt in order that they may render assistance to each other in case of necessity, and one which the writer induced many municipalities to use, is for them to have on hand adapters which will enable them to connect with the surrounding municipalities within a certain radius.

PETERBOROUGH BRANCH ENGINEERING INSTITUTE OF CANADA

AT the Annual Meeting of the Peterborough Branch, Engineering Institute of Canada held on Thursday evening, May 11, the following officers were elected for the coming season:

Hon. Chairman, P. L. Allison, Canadian General Electric Co.; Chairman, P. P. Westbye, general manager and chief engineer, William Hamilton Co.; Vice-chairman, R. L. Dobbin, water works superintendent, Utilities Commission; Secretary, R. C. Flitton, Wm. Hamilton Co.; Treasurer, A. B. Gates, Canadian General Electric Co.; Executive committee, H. O. Flisk, manager Electric Department, Utilities Commission; E. R. Shirley, Can. Gen. Electric Co.; W. M. Cruthers, Can. Gen. Electric Co.; A. L. Killaly, Supt. Trent Canal; A. A. Richardson, Res. Engineer, Utilities Commission; B. L. Barns, Can. Gen. Electric Co.

The annual reports of the various officers and committee chairman were presented. Fraser Keith, general secretary of the Institute, was present and addressed the meeting on the Policies of the Institute.

As a result of negotiations which have been conducted between Sir Adam Beck and representatives of the Dominion Power and Transmission Co., of Hamilton, it is understood that tentative proposals have been made for the incorporation of the Dominion Power and Transmission Co.'s lines from Oakville to Hamilton and from Hamilton toward Grimsby in the radial scheme from Toronto to Niagara Falls if that undertaking be proceeded with under the amended powers to be granted by Hon. Mr. Raney's new Hydro-Radial Bill.

*Paper read before Canadian Section of American Water Works Association, Brantford, Ont., May 12.

PREVENTION OF ELECTROLYSIS TROUBLES IN UNDERGROUND WATER PIPE*

Effect of Electric Currents on Cast Iron Pipe — Many Methods Used To Reduce Damage — Description of Pipe Drainage System — Insulating Pipes.

By E. B. Stewart.

Electrical Engineer, East Bay Water Co., Oakland, Cal.

ELECTROLYSIS may be defined as a process by which chemical changes are caused by an electric current independent of any heating effect. In order that electrolysis may occur, there must be a flow of electric current through a conducting liquid from one terminal to another, and the conducting liquid must be a chemical compound or solution which can be altered by the action of the electric current. The injury resulting from electrolysis is brought about by removal of part of the metal when the stray current leaves the metal to go into the soil. That is, the stray current can flow from the metal into the soil only by taking a part of the metal with it.

The majority of the street railways of the country are operated on the single overhead-trolley plan, with the electric current flowing onto the rails through the car wheels, after it has passed through the car motors. If the rails of an electric road are not insulated from the earth, they will not carry the total current all the way back to the power house. A part of the current will branch off into the earth and flow through the surrounding pipe structures, returning to the rails at certain fixed points. This branching off of current depends upon the conductivity of the earth, and the character and relative position of the metallic masses in the earth with respect to the rails.

Underground waters, rivers, lakes, etc., influence more or less the path of earth currents, but extensive pipe systems of good conductors have a still greater influence.

The return current will be distributed through all the conductors in parallel with the rails in the order of the divided circuits; i.e. the strength of the current in all possible paths in parallel will be inversely proportional to the resistance in each path.

The interchange of current between rails and pipes have certain earth resistances to overcome in passing from rails to nearby pipes and vice versa. These resistances are of primary importance in determining the extent and seriousness of electrolytic corrosion. Obviously no electrolytic corrosion would occur should the resistance between rails and pipes be zero, and likewise no trouble would occur should the resistance be infinitely high. Hence resistances between these extremes determine the extent and seriousness of electrolytic troubles.

In making an electrolysis survey, the underground pipe system is generally divided into zones known as Positive, Negative and Neutral zones. These zones may be best illustrated by a pipe line parallel with an electric railway from the power house to remote points near the end of the line.

That portion of the track more remote from the power house will be at a potential above the earth, and those portions of the track in the vicinity of the power house will be at a potential below that of the earth. Consequently in the outlying district these currents, after getting into the earth tend to flow as a general rule in the direction of the power house and they gradually accumulate on the pipe line. This area is known as the Negative Zone. But when they reach the region near the power house, these currents are again discharged through the earth to the negative railway structure. In this area damage to the pipes most frequently occurs and is known as the Positive or Danger Zone.

The Neutral Zone is that portion of the pipe midway between the power house and the end of the line.

The reason for failures in areas near the power house are more or less clear in a general way to everyone. But the reason for troubles in outlying areas is sometimes more

difficult to analyze. In large cities where a number of power stations are operating it is not uncommon for trouble to develop at outlying points between power stations.

Investigation very often develops that these areas are of swampy earth of very low conductivity and perhaps the rails pass around this region in a somewhat circuitous path. Consequently strong currents are set up as the current shunts from the rails and passes over the affected area seeking the rails again on the opposite side.

Another example may be illustrated by two separate tracks leading from the same power house, and laid out in such a way that the return of one is almost without loss of potential, while the other has considerable loss. In this case all the current will not return through the rails, but part of it will leak across through the earth to the track which is without loss of potential. These currents will accumulate on the pipes running in the same general direction and very often cause destruction in a very short time.

Methods Used To Eliminate Damage.

In an effort to reduce or eliminate damage to pipe systems due to stray earth currents a great many methods are in use.

Those methods which are commonly used are: (1) Surface insulation of pipes; (2) Insulating joints; (3) Pipe drainage systems.

Experience has shown that painting or otherwise insulating the surface of pipes by the use of treated paints does not give satisfactory results in areas where the pipes are carrying a large amount of current.

The primary reason for failure of paints under this condition lies in the fact that none of the paints, as you all know, are absolutely impervious to moisture. Consequently, as moisture deteriorates the paint, the paint becomes more conducting for electric current resulting in the formation of more or less gas beneath the coating. As this gas increases in amount and expands, the coating is ruptured, after which the current flow is greatly increased at the point of breakdown resulting in rapid electrolytic corrosion of the pipe.

The system of electrolysis mitigation which is most generally used is the pipe drainage system. This system is employed in a variety of forms, the principal ones being as follows:

1. Where direct ties with wires or cables are made between underground pipes and rails.
2. Where uninsulated negative feeders are run from the negative bus to the pipes.
3. Where separate insulated negative feeders are run from the negative bus to underground pipes with resistance taps taken off at intermediate points.

Of these systems the simplest and least extensive system is that of placing direct taps to the pipes in the positive zone. One difficulty of this system of multiple taps lies in the fact that the drop of potential on the pipes is always equal to the potential of the tracks. In other words, if the rails carry a large amount of current, a heavy current will also be produced in the pipes; and in case high resistance joints are encountered a large amount of current will cause heavy leakage around the joint and cause rapid destruction to the pipes. In case of a broken bond in the track system the amount of current will be considerably increased.

Pipe Drainage System.

The primary object of drainage by means of uninsulated and insulated negative feeder systems is to keep the pipe drainage system entirely independent of the tracks so that the flow of current around bad joints in the pipes will be less serious.

Fundamentally this system consists of running copper cables from the negative bus parallel with the pipe and tapping to the pipe at frequent intervals.

By the use of resistance taps the current can be controlled so that an equal distribution of current is drawn from the different taps. In this way a better distribution of the current in the pipe system can be secured and heavy current on the pipes at any point can to a certain extent

*Paper read before California Section, American Water Works Association.

be avoided, and at the same time reduces to a minimum the cost of copper cable.

Another method of pipe drainage system is that of running different feeder cables from the negative bus and tapping to the pipe at frequent intervals. In this case the feeders are designed so that practically the same amount of current will flow over the feeders from each tap and thereby produce a minimum drop of potential between points at which the taps are connected.

These systems in general practice, however are seldom employed in the manner as outlined above. The most common practice is to run a copper wire or cable from the negative bus or from negative return feeder to the pipe. In many cases pipes are connected to the rail near the substation, and very often, connections are made to the rails at points considerable distance from the station.

From a personal study of the pipe drainage systems, I am convinced that, while it can, under certain conditions be used to advantage as a secondary means of lessening trouble, its installation in large city waterworks as a principal means of electrolysis mitigation is an unwise procedure. There are, however, certain special cases where the pipe drainage methods will give fairly good results. This applies particularly to suburban areas where the pipe networks are small. Under this condition, limited drainage may offer the best means of dealing with the problem, provided there is no appreciable leakage of current from the rails at remote points from the power station.

Bonding to the rails at remote points from the power station is out of the question and should not be resorted to. As an illustration of the disadvantage of this system, we have a case where the pipe line crosses under the rails at a point 2900 feet from the power house. The reason for placing a bond at this point was obviously due to the fact that tests with an indicating meter showed the pipe to be of positive potential to the rail, and the conclusion arrived at, therefore, was that lowering the potential between the pipe and rail would relieve the pipe from electrolytic corrosion. Shortly after placing the bond to the rails at this point, trouble began to develop very close to the point where the bond was connected. No account, however, was taken of the potential of the rails with respect to the earth and also the reversal of current flow from the rails to the pipes during certain changes in the load distribution. The rails at such distances from the power stations are generally always of positive potential to the earth. It is therefore clear that while the bond has removed the discharge of current from the pipe to the rails, the pipe is still positive to the earth; i.e. the pipe is of the same potential to the earth as the rail by reason of the bond connection. Hence the increase of current over the bond produces a heavy discharge of current into the earth causing destruction in a short period of time.

To mitigate a condition of this character involves considerable expense regardless of which plan is to be employed. To attempt to correct this trouble by the proper drainage methods would not only be costly but rather uncertain; especially without certain remedial measures to be taken by the railway people. Fundamentally a drainage wire to accomplish the desired results in this case must be connected very close to the power station which would result in considerably more current being drained from the pipe, and perhaps the increase in drainage would be of such magnitude as to produce little or no change in the potential readings at the rails, hence there would be no benefit derived from this plan. In other words, the closer the drainage wire is connected to the station the amount of current picked up from the earth will increase in like proportions. And in long drainage wires the size of the wire would necessarily have to be very large to maintain a drop of lower potential than the rails.

Insulating Pipes.

I believe that the safest and most economical plan to mitigate cases of this character would be to enclose the pipe in a wooden conduit and to fill it with insulating compound. While this plan is costly it serves a double purpose;

i.e., the trouble is not only corrected at the rail, but trouble is also minimized to a certain degree, at points remote from the rails due to the fact that insulating the pipe will cause a smaller amount of current to accumulate on the pipe in outlying areas.

Another case of somewhat similar nature is where the pipe runs parallel with the rails and is connected by a drainage wire to the negative bus. This pipe is seriously affected at a remote point where the pipe crosses and runs in very close proximity to the rails.

To mitigate this case by the drainage method would necessitate extending an insulated drainage wire from the negative bus to a point in the affected area. This plan would meet with the same objections as in the previous case.

One of the objections to the pipe drainage system, and this applies to all methods that are in practice, is the fact that they are designed to relieve the symptoms and do little or nothing towards removing the cause of the trouble.

A serious objection to pipe drainage is to be found in the interchange of current between underground structures, resulting from unequal drainage. The drainage of one system of pipes will of course lower its potential with respect to the neighboring metallic structures, thereby tending to injure the latter. This in turn calls for drainage of the injured system, which may damage the first or other structures, and consequently, a system of competitive drainage is established.

This competitive system of drainage requires constant watching, as changes and extensions to the system will establish added points of hazard to the system.

Another difficulty lies in the fact that structures owned by different interests cannot be bonded together except by an agreement between the owners. This very often of itself makes it impossible to apply a comprehensive drainage system to all structures, because of the impossibility of obtaining an agreement of all owners to allow connections to their structures except on condition that another interest assume the liability for any injury which may result from such connections.

In the early stages of the practical working out of the drainage will become a menace to the system. It is largely beneficial, reducing danger in positive areas more than it increases it elsewhere.

As the system grows, the load increases; more and heavier bonds become necessary and the current in the pipes may become so great that any further extension of drainage will become a menace to the system. It is largely due to this slow and obscure manner in which trouble develops that has caused this method to be so widely used. That is, the placing of additional bonds between pipes transfers the trouble from where it has been most evident to a new location, where it may require several years to manifest itself anew. Hence the intervening lull which creates a favorable impression is sometimes difficult to dispell even when trouble later occurs.

Another disadvantage of the drainage system is that phase of electrolysis of water pipes which is caused by over-drainage of underground cable systems.

Pipes as a rule are much closer to cable conduits in the ground than they are to rails. In many cases they are but a few inches apart, and in some cases rest directly against the conduit. Under such conditions, where both metals are in wet soil a low difference of potential, say a few tenths of a volt, is often sufficient to carry current and to cause damage to main or service pipe.

It is a most difficult matter to insulate underground cables even with the most improved type of conduits, so as to prevent current flowing from pipes into them, especially when they are near points where the cables are bonded to railway negatives.

The natural attraction for current flowing upon water or gas mains is directly to the conduit, either from the mains or services. This is the case also with hydrant branches and pipes that pass into side streets. In other words, the cable conduit threads its way between gas and water services as they pass in o buildings along a street.

It happens often that pipes are damaged upon streets where there are no tracks. As a matter of fact, the tracks have nothing to do with this feature of electrolysis. In one case where a number of services were found to be leaking, investigation developed that a cable conduit passed directly under them. The services were one-tenth of a volt positive to the cables. In this case the soil was wet clay and the nearness of pipe to the conduit made up for the comparatively low potential to destroy the pipe.

This phase of electrolysis, therefore, shows the necessity of conducting tests between pipes and underground cable systems. Ordinarily this phase of electrolysis would not be suspected, as tests between piping systems and rails would not indicate that such damage was going on.

Laying Service Pipes.

In laying service pipes, it is advisable to keep the pipes as far away from cable conduits as it is possible to do so, because there is no telling how the currents will flow along the pipes and pass out of them at any convenient point, and generally the point which is nearest the conduit is where the most of the current leaves. If the soil is of sand not much current will pass, but if it is wet clay, then a sufficient amount of current may pass to cause electrolysis corrosion.

The most valuable mitigative measure I believe that can be applied to pipe systems consists in the proper use of insulating joints. We believe the extensive use of such joints should be encouraged in new work and in making repairs.

There are many who criticize this method from the standpoint that current will flow around the joint and cause destruction of the pipe on the positive side of the joint. It is quite true that trouble of this character will arise and cause destruction of the pipe, provided the joints are indiscriminately placed without regard to their frequency, the kind of joints best suited to certain conditions, and the complication arising from the presence of other pipe systems not so insulated. All of these are important factors must be carefully taken into consideration if adequate protection is to be secured. It should be further understood insulating joints should be considered as an auxiliary in connection with and supplementary to measures to be applied to railway return systems for reducing stray currents to the lowest possible minimum. While it is not always possible to reduce economically stray current from the rails, it is nevertheless advisable to obtain data to show a fairly good idea of the nature and extent of stray current from the tracks.

As a general rule where a pipe line is laid with about every fourth or fifth joint an insulating joint, the line has such a high electrical resistance that no measurable current flows on the line, although considerable current exists in the earth parallel to the pipe line.

Placing insulating joints at too infrequent intervals is probably responsible for a good deal of disfavor of this system. Obviously if the joints are placed far apart, the long stretch of intervening pipe may pick up considerable current. Since this current must flow out of the pipe as it approaches the insulating joint, serious electrolytic corrosion may occur on the positive side of the joint. The more frequent the joints are placed, the less damage will occur from this source.

In these installations we find that it is necessary to install such insulating joints not only in the positive areas but also the negative areas where considerable current in the earth parallel to the pipe exists.

Installing Insulating Joints.

In connection with the installation of insulating joints on wrought iron and steel pipes. It has been found necessary to increase the length of the joint by surrounding the joint and pipe with a wood box, leaving a space inside to be filled with insulating compound. The length of the boxes depends upon the resistance and amount of current in the soil.

Enclosing insulating joints does not materially increase the resistance of the joints, but a long insulating

joint gives a more even distribution of leakage current than a short joint. A long insulating joint, therefore, is to be preferred when there is considerable potential across the joint or where the resistance of the surrounding soil is very low.

In a number of installations we found considerable current to flow around the joints, due to service pipes being in physical connection with gas services at the houses. This trouble was corrected by inserting an insulation joint at the service meter.

In some cases, however, it was found necessary to install an insulating joint in the service at the main and also a second joint at the meter. The necessary location of these joints must be determined from the results of electrical measurements.

We find the flanged type of joint the most desirable and economical joint to be used on wrought iron and steel pipes. This insulating joint has been made up of a disc of insulating material between the surfaces of the flanges, and placing insulating washers under the bolt heads and nuts. Red or gray fibre has most commonly been used for insulating material.

For cast iron water mains with bell and spigot joints we use a short wooden ring between the inside of the bell and the end of the spigot to prevent metallic contact between the pipe lengths, and then we caulk the joints with cement. The bead of the spigot end of the pipe was removed.

We find that the current in the pipe is considerably reduced by the use of cement joints. This, however, does not in all cases prevent electrolytic corrosion in localities where current can reach, as the pipe by way of laterals or where it is closely adjacent to other conducting structures or when there is leakage from another transverse pipe.

In the practical working out of the various systems of electrolysis protection, the conditions of the railway systems are usually ignored. I believe that a more logical and, at the same time, effective and economical procedure to handle the problem is first to obtain a general working knowledge of the railway systems, that is, a knowledge concerning the load factors of the various power stations, the operating time of each station, and a general knowledge of the leakage currents from the rails. From certain electrical tests it is possible to calculate the probable distribution of the leakage currents from the rails and to locate the places where there is a probability of electrolytic corrosion.

In order to obtain such information with any degree of accuracy, it is quite necessary that cooperation exist between the railway companies and owners of underground utilities.

ROAD WORK OPENING UP IN ALBERTA

TEN Alberta engineers in charge of the Provincial Government's program of road work for the coming season, have been sent out, and are now in the field ready to begin active operation as soon as weather and soil conditions will permit. Under the new system adopted by the department this year, there will be no more road foremen, and an entirely new code of instructions for the engineers and inspectors has been drawn up for application in the ten districts into which the province has been divided for road work purposes. The list of engineers is as follows: District No. 1, Geo. McMillan, Medicine Hat; No. 2, H. P. Keith, Lethbridge; No. 3, Malcolm Calder, Calgary; No. 4, Jas. McQueen, Hanna; No. 5, E. Ainsworth, Red Deer; No. 6, Ed. Robertson, Camrose; No. 7, J. A. Morrison, Vermilion; No. 8, H. S. Day, Edmonton; No. 9, D. Bard, Edmonton; No. 10, A. H. MacQuarrie, Peace River.

With a total of \$800,000 expended to date, another \$250,000 will be required to bring the commercial manufacture of Saskatchewan lignite to success. Of this additional amount, \$125,000 is required in cash immediately. In urging that the money be voted, officials of the lignite utilization board announced to the members in committee that they were on the eve of success.

BITUMINOUS SURFACES ON GRAVEL ROADS*

Refined Tar Products Give Satisfactory Results for Gravel Road Surface Treatment — Various Methods of Application Tried Out — Standard Practice Adopted

By Paul D. Sargent,

Chief Engineer, Maine State Highway Commission

FOR the last eight years the Maine State Highway Commission has been successfully treating gravel road surfaces with a refined tar product suitable for cold application. This method was adopted after an experience covering four or five years with various asphaltic oil and tar products. Where the two types of material were used on stretches of road contiguous to each other and conditions were as nearly identical as it would be possible to have them and both sections carried the same traffic, we found that the tar products gave a much more stable surface and that it lasted two to three months longer in the fall after freezing nights and thawing temperatures which prevailed during the daytime.

We also found that the tar products after being laid about a week took their set and with the exception of possible softening on extremely hot days, gave no further trouble after completion of the application. On the other hand, asphaltic oils would soften up many times during a protracted rainy period, more or less emulsifying, and resulting in a very disagreeable surface condition. This condition was also very marked during the period of freezing temperatures during the night and melting temperatures during the daytime, which prevail sometimes for three or four weeks in the fall.

It will be of interest to relate some of the experiences from which our standard practice in the surface treatment of gravel roads with bituminous material has been developed.

First Surface Treatments

Some eight or nine years ago when we first tried these treatments, the principal use of surface applications was to allay dust. Light asphaltic oil, known as "45 per cent oil" was generally used for that purpose. The real effect of the oil always appeared to be merely to load the dusty surface particles of the road with so much weight that when stirred up by passing traffic these particles did not rise very much above the road surface and consequently were not blown around much. Naturally, we more or less followed in our early tar applications, methods in vogue at that time. We attempted to get a true crown on our gravel roads by adding an inch or an inch and one-half of new gravel where necessary and then by the use of a drag or light grader truing up the surface before the application of the bituminous material. The first year this work was done on any scale, we applied our bituminous material in two applications. In May we used about four-tenths of a gallon to the square yard and about the first of August retreated all of these surfaces with an addition two-tenths of a gallon per square yard. Treatment was laid on a surface only 10 ft. wide. The real thing we sought to do with this treatment was to bond the loose surface material to the tightly bonded surface below it, and we accomplished this with satisfactory results.

By the end of the season, however, we observed that on certain sections of our roads so treated there was a slight rippling and waving of the surface. It occurred to us that this might be on account of the fact that we had not secured an effective bond between the loose surface particles of the road and the tightly bonded gravel beneath. In other words, the material which had been impregnated with tar had laid more or less as a mat upon the surface and not being sufficiently filled with mineral aggregate, had pushed.

We obtained, however, a much more satisfactory surface, generally speaking, than we had ever before seen on

*Paper read before the Eighth Annual Conference on Highway Engineering, Ann Harbor, Mich.

any surface treated road. The good sections presented the appearance of a first-class bituminous macadam surface, tightly sealed, smooth and dustless. As might have been expected, the edges of the bituminous treated section sheered off and crumbled away on account of so much traffic turning out for meeting and passing.

Next Development in Surface Treatment

Our next development was an attempt to clean the gravel surfaces before the application of the tar. This was accomplished by the use of graders and drags and later by using a street sweeper and finally by following that with hand sweeping. We also increased the width of our treatments to fifteen feet. We found that all these steps gave us a much improved surface and in fact since the first year we used tar we have never made but one application to any gravel surface during a season. No sand covering was used during our first two or three years of treatment. The tar was applied on warm dry days from an automobile tank distributor under pressure and we just allowed the tar to lie on the road until it was absorbed and took its set.

Needless to say, we had many complaints from the traveling public on account of the dangerous condition of a freshly tarred surface for rubber-tired traffic. We attempted to obviate this danger as far as possible by treating one side of the road at a time. We would do a considerable stretch of road, anywhere from six to ten miles long, and treat it on one side only. While the treatment was being put on the first side, the other half of the road was left open for traffic and by the time the first half was finished, the tar that had been first laid was well enough set so that the road could be used for traffic. Then the other half of the road would be treated in the same way.

We observed, of course, that steel-tired traffic wherever it ran on the freshly tarred surface, stripped the bituminous material from the surface. This made it necessary to do more or less patching by hand. Also, on account of the increasing automobile traffic, which was continually getting on the freshly tarred surface, we found it necessary to sand the tarred surface a few hours after application.

Recent Practice in Surface Treatment

For the last three or four years we have made a practice of treating all of our surfaces eighteen feet in width, which has practically obviated the necessity of any patching on the shoulders or edges of the treated surface. A road eighteen feet wide, which by the way is our standard width of pavements and hard surfaces today, affords a good double track way. We have been following the practice during the last three or four years of immediately covering the bituminous material with a light application of sand. By immediately, I mean that within five or ten minutes after the distributor has delivered tar to the surface of the road, it has been covered with sand.

There are one or two points about sanding that I think should be spoken of. We place the sanding gang at intervals of 150 to 200 ft. apart, according to the length of road that the tank of tar will cover. Immediately the tar tank has passed, sanding is started at the center of the road and first a place is made where passing vehicles may turn out on the freshly tarred surface. This affords traffic meeting places at stated intervals, so that with careful driving it is not necessary for a vehicle to become smeared or spattered with tar or to take the risk of skidding incident to driving on a freshly tarred surface. Our sanders are also instructed to keep an eye to the traffic so in case anyone gets into difficulty we will have some witness as to what actually happened. These men also more or less caution drivers to be careful. When we are applying tar over a summit grade we always plan to have a sander stationed at the summit to keep an eye to traffic and to warn them against collision. These points we have learned from experience and we have found them to pay.

Standard Practice Developed

Generally speaking we have developed the following standard practice: As early as we can get on the roads in the spring, that is, when the roads begin to settle and dry

out after the frost has left them, we begin shaping with the road grader. The roads are carefully watched during the two or three weeks while they are settling and are shaped either with a drag or blade grader several times if necessary to help them to settle with as true a contour as possible. The next step in our surface treatment is to draw out sand, which is left on the shoulder of the road in piles of about a quarter of a yard every twenty-five feet. Generally speaking, we use about fifty yards of sand to a mile for cover. We use less sand, however, on a brand new treatment than we do on re-treatment. Sometimes as little as thirty yards to a mile is used on the original treatment. Re-treatment will take from forty to fifty yards per mile, as the tar has less opportunity to penetrate into the surface of the road. The next step is to clean the surface of the road of all loose material. If a pocket of sand, dust or stone is left on the surface we are absolutely sure to have the treatment break over that pocket in a short time after application.

This cleaning is done by means of a street sweeper behind a light truck and if further cleaning is necessary after the sweeper has finished, it is done by men with push-brooms. Then comes the tar distributing gang, which is equipped with Kinney pressure distributors mounted on $3\frac{1}{2}$ -ton trucks. We have limited ourselves to this size of equipment because it is as heavy as our roads, generally speaking, will carry. We have a law which limits the gross weight of load to 9 tons, and I am free to say that one of these 600-gal. tanks filled with bituminous material will slightly exceed the statutory limit for the gross weight of load. Under average conditions one tank truck will spread about 2,500 gallons of tar per day. We still hold to the practice of tarring one side of the road at a time and several days may elapse between the tarring of the first side and the tarring of the remainder of the road. As pointed out above, immediately after the tar is applied a light sanding is given. We put on just enough sand to fairly blot the bituminous material and keep it from running off the crown of the road to the edge. The surface is carefully watched for three or four days and if evidence of bleeding shows up, spots where this occurs are treated with more sand. Sometimes after a treatment has been down for two or three weeks an extremely hot day will start a little bleeding. This is watched carefully by the patrolman and the same treatment of light sanding given.

Treatment of New Gravel Surfaces

In the treatment of new gravel surfaces, that is, surfaces which have never received a treatment before but which may have taken traffic anywhere from two to four or five years with an occasional resurfacing of gravel, we used not to exceed half a gallon per sq. yd., and in some cases probably use four-tenths to forty-five-hundredths of a gallon per square yard for the treatment. The amount of material depends upon the tightness of the surface. We have found that the smallest quantity of material we can use and get the surface covered gives us the best result. With a small quantity we never have trouble from rippling or waving of the surface, provided the gravel is in proper shape to receive the treatment when it is given, that is, thoroughly bonded and tight with no pockets of loose gravel, dust, or other material. We also find that surfaces which have received a small quantity of tar can be re-treated for a longer time than surfaces which have been given a heavier treatment. Those which have received the heavier treatments will ripple and get out of shape, say in two, three or four years, while sections receiving a light treatment can be maintained without breaking up for a considerably longer time.

It must be borne in mind that the addition of the bituminous surface treatment to a gravel road does nothing but preserve the surface against disintegration from passing traffic. It does not materially strengthen the road in the sense that it will cause the road to take heavier loads than the gravel surface itself or the foundation upon which it is laid will sustain. Surface treatment will not supply or take the place of drainage.

Our surface treated sections are kept under constant patrol maintenance. We patrol these roads with a light truck and two men, and they are assigned sections anywhere from 12 to 18 miles long. Besides watching the bituminous surface and mending any small breaks that may occur, and we have these breaks occasionally, and patching the shoulders, these men also keep the dirt shoulders shaped by dragging, keep the gutters and culverts clear, and do whatever other work is necessary. We supply about three barrels of bituminous material, for each mile of surface, the material being mixed with sand and kept in stock piles. The mixing is usually done by hand and we use about 17 gallons of tar to a cubic yard of sand. In a few instances we have used a small concrete mixer to prepare the tar and sand for patching and we have been able to use as little as 14 gallons to a yard of sand when the mixing is done in a concrete mixer. Patches are made by simply cleaning out the hole, throwing in the mixture of bituminous material and sand and patting it in with a shovel. Any bad breaks on the shoulders are repaired the same way.

Many of our gravel treated surfaces do not remain intact over the spring period, a good deal breaking up, which is due to several causes. First an open winter which allows the frost to penetrate deeply into the roadbed and permits traffic to run all through the winter, or heavy traffic coming on these surfaces when the frost is leaving and the surfaces being soft, will break up and often disintegrate. This really is more or less of an advantage, because it obviates the necessity of breaking up these surfaces and we save just that much expense in getting the surface ready for subsequent treatments. I have in mind one section of gravel road which was surface treated during the summer of 1920. Most people called it a good section of road, in fact many automobilists have referred to it as bituminous macadam and many of our citizens refer to our surface treated gravel roads as bituminous macadam. The particular section I refer to was so bad during March, 1921 that automobiles could not pass over it. For a distance of four or five miles, this piece of road was literally a sea of mud for a period of about three weeks. Of course the surface treatment completely disappeared. We reshaped the road as it dried out and re-treated it last spring. It presented a good surface all through the summer and fall until it was covered with snow. I apprehend that the coming spring will be a repetition of the spring of 1921. The road will be in about as bad condition as it was then but by June 15, it will look like a boulevard.

On the other hand, I have in mind one section of surface-treated gravel road which is built on a sandy foundation where the drainage is perfect that has never broken up during the last eight years. It gets a re-treatment about every other year, maybe one-sixth or one-seventh of a gallon, as the gang goes by, and during the intervening year it does not get treated. This particular section shows evidence of slight ripples. It is on our heaviest travelled line, where the snow leaves earliest in the spring and we have the most severe truck traffic in the State.

Re-Treatment of Good Surfaces

We have a good many sections of surface treated gravel roads which do not break up in the spring, most of these sections being re-treated each year. The second year the amount of tar which we have used has been from three-tenths to one-third of a gallon per square yard. For the third and fourth years the amount has run as light as one-quarter of a gallon, and in some instances two-thirds. These surfaces are quite apt, however, after three or four re-treatments, to become ripply enough so as to be uncomfortable to ride over, this condition being due to a combination of reasons. One is that we may have as much as one and one-half or two inches of tar penetration which becomes separated from the gravel road itself on account of the passage of heavy loads when the frost is coming out of the ground and the whole roadbed is more or less soft. Where this tendency exists at all it is always more pronounced where the surface has received successive treatments than where only one or two treatments have been given. Each year we have to break up more or less of this kind of surface

and get the road in shape for new treatment. The method used is approximately as follows: We take a section of road about 1000 ft. long; it is broken up either by using a pressure scarifier on a steam roller or by using a heavy blade grader behind a truck or a roller and setting the blade so that it will do more of a plowing operation than a scraping one. The bituminous surface is in this way broken up into chunks anywhere from two inches to two or three feet square. We next take a road grader and scrape this whole surface off to the shoulder of the road, then we plane the roadbed below to as true a surface longitudinally and transversely as possible. We then work back a portion of the bituminous bound material from the shoulder, distributing it over the surface.

In this distributing operation the bituminous bound gravel is broken up more or less into small chunks. We then leave the road for two or three days for traffic, which materially helps to further break up these pieces of bituminous bound gravel, then the road grader is brought on and further working of the surface is given just by pushing the chunks around and pulling in more from the sides. By watching the surface carefully and using the road grader every two or three days we have been able to get the surface back into reasonably smooth condition. It presents more or less of a mottled or mosaic appearance. Gravel which has been covered with the bituminous material has lost its binding property and it is necessary quite often to add a bit of good binding material here and there to complete the bonding of the surface. This binding material is used sparingly. As soon as we have the surface in shape we give it a new application of tar. We find that a surface broken up and reshaped as just described is very hard to keep in true contour under traffic and if it is allowed to go say two weeks, we may have to break it up and rebind it before the tar surface is applied, otherwise it would be so uneven that it would be a bad riding road all through the season. Experience has shown that one of these old tar surfaces can be scarified and broken up more easily when the temperature is between 60 and 70 degrees F. than during cooler weather. Good warm, sunny weather also materially assists in breaking up the chunks of tarred gravel which are left on the surface of the road.

One thing we have satisfied ourselves on is the fact that we cannot successfully apply tar surface treatment on a wet or damp road. We have also had the experience of rain falling within two or three hours after tar has been applied and before it has taken any set, and with a traffic resulted in making a mushy surface which it is practically impossible to true up and make satisfactory. We have practically come to the conclusion that when this condition prevails we would do better to scrape the new tar surface right off on the shoulder, throw it away, reshape our road and put on a new application of tar. We will spend more money in patching the surface which is laid under these conditions than it would cost to replace the surface, and such surface after patching has never been satisfactory.

During the last four years our surface treatment work, plus the cost of patrol maintenance, for a season of eight months has averaged to cost \$1,000 per mile. We estimate sand to cost us an average of \$2.00 per cubic yard delivered in piles alongside the road. Tar costs us 12 cents in tank cars delivered on the nearest railroad siding. We figure the cost of applying the tar at 2 cents per gallon. Sanding costs about 75 cents per cu. yd. of sand. Using say 4,000 gallons of tar per mile would cost \$560.00; fifty yards of sand will cost \$100, applying the sand \$37.50, making the cost of the tar treatment covered with sand \$697.50.

Cost of Surface Treatments

The average cost of shaping and getting the surface ready for treatment in the early spring would be about \$25 per mile. We use ordinarily a 2-ton truck to draw the road machine. The truck rental would be \$10 per day, the driver's pay \$3.75 and a helper \$3. The rental of the road grader is figured at \$2 per day, while gas and oil will

run from \$5 to \$6 a day. This outfit will smooth four miles per day on an average, usually on the first smoothing we make about four round trips per mile. On subsequent smoothings possibly two trips will do.

For sweeping we use a mechanical sweeper drawn by a light truck say $\frac{3}{4}$ -ton or a one-ton truck. We usually make four round trips with the sweeper, and this outfit will sweep about two miles per day, as we can only run the sweeper about three miles per day. The expense for sweeping would run about as follows:

Truck rental \$5; oil and gas \$2; driver \$3.75; helper \$3; rental of sweeper \$2; making a total of \$15.75, an expense of sweeping two miles of \$7.87 per mile.

The balance of the \$1,000 is paid for patrolling the road through the season. The usual patrol gang on bituminous surface treated gravel roads is a patrolman with a one-ton truck and helper. According to the amount of traffic and the condition of the road, this outfit will cover anywhere from twelve to eighteen miles of road. The outfit costs \$13.75 per day, made up as follows: Rental of one-ton truck \$5.00; gas and oil \$2; patrolman, who drives the truck \$3.75; helper \$3.00. These gangs work an average of two hundred days per year, so if the patrol section was 13 $\frac{1}{2}$ miles long the average cost per mile would be just \$200.

Based on the figures given above, this would show a maintenance cost of \$930.37 per mile. I have said that on new roads we use half a gallon of tar per square yard. That will increase the cost \$140 per mile over the figures already given.

Where it is necessary to scarify or break up the old bituminous surface, we run into a considerably larger expense for preparing the surface than indicated above. I think I have given enough explanation, however, to show that the average cost is very close to \$1000 per mile.

There is one point that I neglected to mention and that is that quite often in making an original treatment if traffic is running fairly heavy and it will take us six or eight days to treat the section we are working upon, we will slide over the road with a priming coat of the tar material, using two-tenths to one-quarter of a gallon per square yard, the quantity depending upon the tightness of the surface. This will hold our surface in perfect condition under traffic for a week or ten days. We immediately apply the balance of the quantity, sand, and finish up the job. We have almost come to the conclusion that it would be good practice to do the priming everywhere on new surfaces. It gives a better penetration of the bituminous material, besides holding the surface in proper contour until the treatment can be completed.

In conclusion I might say, that we have many miles of surface treated gravel roads which are carrying a twelve-hour traffic, averaging from 2,300 to 3,500 vehicles per day for a week's time, with a maximum traffic during the twelve-hour period of as high as 5500. This traffic continues for a period of four to five months. We find it impossible to hold our gravel surfaces in satisfactory condition by ordinary patrol maintenance methods, that is, dragging and patching with gravel, when the traffic exceeds 500 to 600 vehicles per twelve-hour day, and the expense of such maintenance runs about \$500 per mile.

The material which we use for surface treatment falls within the specification T. C-1, tar for cold application. Bulletin No. 691, U.S. Department of Agriculture. Credit for the most of the developments we have made in surface treatment of gravel roads is due to A. J. Wiggin, Superintendent of Maintenance of the Maine State Highway Department.

Announcement was made recently of the formation of the Hochelaga Cement Company, Limited, with plant in Montreal, and authorized capitalization of \$4,000,000 preferred. The new company, which is planned to meet requirements in Quebec and also for export, has been formed by Montreal interests, and its organization has been effected by Credit Canada, Limited, investment bankers. Capacity of 750,000 barrels a year is aimed at with expansion up to 5,000 barrels a day in the future.

MODULAR RATIO UNDER FIRE

EVIDENCE that there is not yet entire agreement with respect to the fundamentals of reinforced concrete design is contained in frequent papers and communications to the technical societies and press on matters about which it has been assumed by many that finality had been reached. One of these dissenting papers is the notable one by H. Kempton Dyson before the Concrete Institute, an abstract of which appears elsewhere in this issue.

Mr. Dyson questions very much the soundness of the common theory of reinforced concrete, in so far as it is based on the modular ratio. In his opinion a reinforced concrete beam is by reason of the inevitable cracking on the tension side resolved into a virtual truss and that it should be figured as such. The action so assumed must of necessity be based upon a thoroughly effective anchorage at each end of the tension steel, since the concrete encasing the steel in the central portion of the beam is very much in the position of a set of idling washers. There are a good many designers who are in agreement with Mr. Dyson with respect to the absolute necessity for a thorough anchorage at each end.

Apparently the revolutionary views that have recently been brought forward with respect to the action of concrete columns are shared by British engineers. Mr. Dyson does not appear to experience any alarm over the surprising fact that stresses in longitudinal reinforcing steel in columns after a few years may be considerably over the yield point. In this he is in agreement with Franklin R. McMillan who frankly accepts this condition of affairs on the apparent ground that columns designed by the common

theory however faulty have been shown to be safe, and that such stresses as actually exist in them may be accepted as satisfactory. Mr. Dyson takes a somewhat different view from that advanced by Mr. McMillan in that he would entirely ignore the ratio of the moduli of elasticity and compute the total resistance of the column as the sum of the two individual resistances of the concrete and steel, the steel rods being constructed as a series of short columns.

Such questions as have been raised by Mr. Dyson and other investigators are sure to bring about important modifications in reinforced concrete specifications. While the common method of figuring concrete beams will probably continue to be followed on this continent, the design of columns is undergoing a change. As an example of this, there may be cited the entirely new specification for reinforced concrete columns of the Joint Committee.

HAULAGE OF CONCRETE FROM CENTRAL MIXING PLANTS.

SOME time ago attention was drawn in our editorial columns to the growing practice of mixing concrete for roadwork at central mixing plants and hauling it to the point of use in motor trucks. A notable instance of success by this method was in work done on the California State Highway system in the Imperial Valley where a haulage requiring 25 minutes of time occurred.

Caution must, of course, be exercised in carrying out this method to insure that the concrete has not lost strength appreciably through initial setting. Even though such has occurred to some extent, the mixture may be useful, as investigation has shown that concrete may be remixed with little or no loss of strength up to the third hour after the original mixing. Another source of possible trouble is in the segregation of the aggregate which it has found may be prevented, in some measure at least, by the use of hydrated lime.

Recent tests made by the United States Bureau of Public Roads indicate that a considerable time may safely be allowed to elapse between mixing and use without appreciable loss of strength. Gravel concrete of 1:1½:3 mix was hauled in trucks and the material tested at periods of elapsed time varying from 15 minutes to 3 hours and 10 minutes. It was found that the average crushing strength of cylinders was very nearly the same for all specimens, but that the workability diminished markedly after the first hour. Apparently, the practicability of the method would depend upon workability rather than strength, as after 45 minutes the mixture was too dry for hand finishing, although it might have been used up to 2 hours of elapsed time with a pavement finishing machine. It thus appears that so long as concrete is workable after hauling, its strength would be sufficient, and that the most practicable way of utilizing concrete hauled from a central mixing plant is to employ a machine finisher. For road or street work where it is impracticable to mix concrete at the point of use this method has become very promising.

PERSONALS

R. O. SWEENEY has been elected president of Queen's University Alumni Association of Montreal.

HENRY J. SPOONER, who has been head of the Polytechnic School of Engineering, Ottawa, for 40 years is retiring in July.

H. A. TERREAU, superintendent of the aqueduct department, Montreal, has been appointed Director of Public Works for Montreal.

ARTHUR WILLIAM CARLYLE, Ottawa, has been appointed Leroy Fellow in Geology at McGill University for 1922-23. He is a third year graduate in geology with honors.

A. L. LATORNELL, engineer of sewers, Department of Works, City of Toronto, has tendered his resignation to

R. C. Harris, Commissioner of Works, and it has been accepted. Formal announcement of the name of Mr. Latornell's successor will be made at an early date.

R. C. MUIR, chief engineer of county roads in Ontario, has been spending a few days in Ottawa at the invitation of the Ottawa Suburban Road Commission, to inspect the roads after the winter's frost and also to advise the commission in regard to details of the work planned for the summer.

LT. COL. H. L. TROTTER has entered private practice as consulting engineer, with offices in the New Birks Building, Montreal. Col. Trotter was until recently construction engineer at Iroquois Falls, Ont., for the contracting firm of Morrow & Beatty, Ltd., Peterborough, Ont. He is a graduate of the Royal Military College, Kingston.

OBITUARIES

ROBERT SLACK, a well known contractor and builder of Ottawa, died suddenly May 6, aged 66.

E. NORMAN, builder and contractor, Yorkton, Sask., for many years connected with the firm of Dryborough and Norman, died suddenly at the age of 37 years.

CHARLES M. TEASDALE, of Toronto, Dominion Land Surveyor, died recently at Flin-Flon, Man., aged 40 years. The deceased graduated with honors from the University of Toronto in 1904, and after graduation practiced his profession in the West in the employ of the Dominion Government. For the past five years he has been located in The Pas district of Manitoba. His last location was the Flin-Flon Copper Mine. He prepared a large number of maps of Western Canada districts.

NOTABLE TREATISE ON BRIDGE ECONOMICS

Reviewed by H. M. MacKay,

Professor of Civil Engineering, McGill University.

ECONOMICS OF BRIDGEWORK: A sequel to Bridge Engineering—By J. A. L. Waddell, D.Sc., LL.D., etc., Consulting Engineer, New York; John Wiley & Sons, Inc., London; Chapman & Hall, Ltd., Cloth; 6 by 9 in.; pp. xxxii + 512; illustrated \$6.00 net.

This book is in effect a sequel to the monumental work on Bridge Engineering published by the same author a few years ago. In the present work the author has undertaken to solve in a comprehensive way the major problems of an economic nature arising in the whole field of bridge construction. At the outset economics is defined as the science of obtaining the desired result with the minimum expenditure of effort, money and material.

Many writers have investigated economic problems arising in bridge construction in a purely mathematical way. The results are seldom satisfactory. Even formulae for quantities alone, so obtained, are usually too intricate and cumbersome for practical use unless the assumptions on which they are based are greatly simplified, in which case empirical formulae are likely to give quite as good results. Besides, of course, even in steelwork, minimum quantity of material and minimum cost are by no means identical. Considerations affecting convenience of fabrication, shipment and erection; variations in the price of certain shapes and sections; the incidence of certain clauses in the specifications and the like, all tend to complicate economic relations and to make the results of narrow theoretical reasoning misleading. In the case of concrete construction this is true to an even greater degree.

In this work the author has for the most part avoided purely mathematical treatment. The typical method of solving the various problems is by means of estimates from

a graduated series of designs, the results of such computations, shown graphically, indicating the conditions of greatest economy. While this method has involved an immense amount of labor on the part of the author, it enriches the book with a large amount of useful and suggestive data. In the case of the more ordinary class of structures the curves of weight and quantity are in close agreement with the best modern examples as built, and will command entire confidence. On the other hand, certain long span cantilever bridges, the Beaver bridge and the Quebec bridge for instance, considerably overrun the weights indicated by the author, for similar structures. Such discrepancies are no doubt inevitable in the case of exceptional structures, but a word of caution to the hasty reader is perhaps desirable.

Among the topics of more general interest, to each of which one or more chapters is devoted, are: The Comparative Economics of Bridges vs. Tunnels; High vs. Low-level Crossings; Steel vs. Reinforced Concrete Structures; Riveted vs. Pin Connected Spans; Continuous vs. Non-continuous Spans; and Cantilever vs. Suspension Bridges. The Economics of Alloy Steels, Layonts, Substructure, Trusses and Girders, Floor Systems, Reinforced Concrete Bridges, Steel Arches, Trestles and Viaducts, Cantilevers, Suspension Bridges, Moveable Spans, Shopwork, Erection, Fieldwork, Floor systems, Maintenance, Waterproofing and many other topics are fully treated. Several of the above topics are discussed by well known specialists as well as by the author, a feature which makes for breadth of view.

Special mention may perhaps be made of the chapters on Steel Arches and on Alloy Steels. Both of these embody the results of a very large amount of investigation. Little information has hitherto been available on the former subject, and the conclusions reached should be very useful to the designer. As regards alloy steels it may be questioned whether the author attaches enough importance to the greater deflections of structures wherein they are used, with the possible consequences in the way of impact and secondary stresses.

The style as in all of Dr. Waddell's writings is clear and interesting. No mere catalogue of topics can give an idea of the amount of stimulating suggestion which is found in every chapter. The author's views often provoke controversy, but it is safe to say that the book will be found indispensable by everyone interested in bridgework.

Many readers will note with regret that the author puts this work out as his last book. Those whose memories reach back thirty years or more, will remember Dr. Waddell as the protagonist in many a well fought controversy, and often in the face of keen opposition, of numerous ideas which are now accepted as the common places of good design. No living engineering writer, it may be believed, has given more freely or more effectively to his professional brethren the fruits of a long and successful experience than has this Canadian born author.

PORTLAND CEMENT ASSOCIATION, ITS CHARACTER AND PURPOSES—By Lester T. Sunderland, president of the association; 4-page pamphlet, 5½ by 8½ in., issued by the Portland Cement Association, 111 West Washington St., Chicago, outlining the objects, aims and ideals of the association.

HARDINGE CONICAL MILLS—Bulletin issued by the Hardinge Co., 120 Broadway, New York, describing conical ball and pebble metal mills for grinding and pulverizing; 4 pp., 8½ by 11 in., illustrated.

ASPHALT PAVING INSPECTION—Circular No. 17 issued by The Asphalt Association, 25 West 43rd St., New York City; 4 p.p., 6 by 9½ in. Article by W. Earl Weller, city engineer, Wilmington, N.Y.; illustrated by four figures reproducing inspector's daily report form, load report form and asphalt laboratory report form.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand or proposed, contracts awarded, changes in staffs, etc.

TENDERS PENDING

The following tabulation is presented as a reminder to contractors in regard to tenders that are still pending, other than those reported in this issue. The word "Issue" refers to the issue of "Canadian Engineer" in which there appeared a notice giving details regarding the call for tenders.

Place of Work	Tenders	
	Close	Issue
Chatham, Ont., construction of concrete pavement	May 17	May 9
North Oxford Tp., Ont., construction of concrete abutments for bridge, also building of grade to bridge....	May 27	May 9
Saskatchewan, Province of, construction of earth road to Wadena.....	May 23	May 9
York Tp., Ont., concrete sidewalks.....	May 20	May 9
Toronto, Ont., installation of one four-million Imperial gallon centrifugal pump at Island Pumping Station....	June 13	May 9
York Tp., Ont., construction of cast iron watermains	May 20	May 9
Hamilton, Ont., erection of school on Bowman St., West Hamilton.....	May 17	May 9
Woodstock, Ont., erection of Bell Telephone exchange building.....	May 18	May 9
Dungannon, Ont., construction of overflow drain	May 24	May 9
Hespeler, Ont., erection of Sons of England Memorial Hall	May 20	May 9
Ottawa, Ont., various work on Civic Hospital	May 25,	
	30, June 1	May 9
Sylvania, B. C., erection of school	May 23	May 9
Waltham, Ont., construction of dam.....	June 1	May 9
Palmerston, Ont., construction of pavement	May 22	May 9
Quebec, Province of, macadamizing of Levis-Jackman highway	May 29	May 9
St. Malachie, Que., construction of metallic bridge	May 23	May 9
Saskatchewan, Province of, construction of concrete bridges	May 29	May 9
Sherbrooke, Que., construction of pavement and concrete sidewalks	May 22	May 9
Nassau, New Providence, Bahamas, dredging	July 15	May 9

BRIDGES, ROADS AND STREETS

Aurora, Ont.—Boards of Trade of Newmarket and Aurora and W. A. McLean, Deputy Minister of Provincial Highways, will confer here with the Yonge Street Highways Improvement Association, with a view to increasing the proposed width of Yonge St. from 86 feet to 100 ft. Property-owners from the city limits of Toronto to Lake Simcoe will be represented. The Ontario Government has called for tenders for the construction of five miles of roadway north of Toronto's limits, and it is expected that a start will soon be made on the work.

Birch Cliff, Ont.—Scarboro Township Council passed by-law authorizing an expenditure of \$39,000 on road construction this year and \$26,500 on road maintenance. Concrete sidewalks will be constructed on both sides of Eastwood Ave. There are now about six miles of sidewalks under construction.

Blenheim, Ont.—Provincial Department of Highways awarded contracts in connection with improvement of Talbot Road as follows: Four miles west from the Harwich and Howard townline to John Clayton, of Harwich, and Alex. Clunis, of Blenheim; four miles west of this and also a division east, to Webster Construction Co., of London.

Brantford, Ont.—Contracts for annual supplies for city were awarded as follows: Asphalt, The Sun Co. of Canada, Ltd., Toronto; road oil, W. C. Brennan Contracting Co., Hamilton; and Portland cement, Alfred Rogers Co., Ltd., Toronto.

Clarkson, Ont.—Toronto Township Council plans to resurface Streetsville road this year and general grading work will be done on other thoroughfares. Clerk, C. H. Gill, Dixie, Ont.

Edenwold R. M., Sask.—Tenders addressed to W. H. Davis, Sec.-Treas., Zehner, Sask., will be received until 6 p.m., June 5, for all or parts of the following work: 40 miles new turnpiling and regrading, 30 miles very light regrading, 11,000 cu yds. filling and 500 lin. ft. culverts. Plans and specifications may be seen at the office of the Municipal Engineers, Parsons Engineering Co., Regina, and at the office of the Secretary-Treasurer.

Elgin County, Ont.—Contract for grading Silver Creek Hill awarded to J. H. Miller, Dutton. Approximate quantity of excavation, \$13,000 cu. yds.

Fort William, Ont.—Tenders closed May 15 for approximately 400 rods of road grading. City Engineer, C. B. Symes.

Galt, Ont.—Grand River Railway has been asked to approve of a plan suggested by K. K. Homuth, M.P.P., for a boulevard drive between Galt and Preston.

Galt, Ont.—City Council intends to construct an asphaltic concrete pavement 10 ft. wide, on the north side of Main St., from Elgin St. to City Limits, at a cost of \$3,300. City Clerk, Joseph McCartney.

Guelph, Ont.—Tenders closed May 11 for construction of concrete sidewalks. City Engineer, F. McArthur.

Hamilton, Ont.—Hon. F. C. Biggs, Provincial Minister of Public Works, announced the following road building program for this district this season: Main Street Road from the city limits to fork of King and Main just below Stoney Creek, Main Street Road from the fork to Winona P.O., five miles; Hamilton-Brantford Road, unfinished portion between Ancaster Village and the county line; foundation work on the Hamilton-Galt Road in Wentworth County to be finished this year; three miles of surfacing from Clappson's Corners to Black's Corners; foundation work on the Dundas Road from Clappson's Corners through Waterdown to the County Line; finish the foundation work on the Hamilton end of the Hamilton-Toronto highway; three miles of foundation work on the Caledonia Road south of the three miles completed last year. It was promised that the top dressing of the Caledonia Road from the Mountain top to Ryckman's Corners would be built, but the work is not included in the construction program.

Hartney, Man.—No contracts were let by the Municipal Council for grading of 9 miles of road and also for the manufacture of concrete pipe culverts required on 38 miles of roads, for which tenders were called. Council decided to drop all work, having failed to receive any assurance of aid from Provincial funds.

Kingston, Ont.—City Council intends to construct concrete walks on the following streets: Adelaide, Alfred, Birch, Earl, Johnson, Macdonnell, Ontario and Thomas, at a total estimated cost of \$6,484.10; also sheet asphalt pavement on Montreal St., at cost of \$4,101.02. City Clerk, W. W. Sands.

Kitchener, Ont.—As only one tender was received by city for bituminous penetration pavement, for which tenders closed May 8, no contract has been let, and it is probable that the work will be done by day labor. Contract for approximately two miles of sidewalk was let to Carl Damman, of this city, and contract for curb and gutter for bituminous penetration roadways was let to B. J. Mickel.

Lindsay, Ont.—Contract for construction of granolithic sidewalks during 1922 was awarded to Geo. H. Lindsay, of this town.

Mimico, Ont.—Town Council is about to issue calls for tenders for construction of roadways. Clerk, J. A. Telfer.

Prince Edward Island, Province of.—Provincial Legislature authorized borrowing of \$450,000 for road building under the provisions of the Dominion Highways Act.

Quebec, Province of.—Work will start this year on important sections of the Levis-Riviere du Loup Road. Minister of Highways, Hon. J. L. Perron.

Quebec, Province of.—Hughes Fortier, M.L.A., for Beauce, had an interview recently with Hon. Mr. Galipeault, Minister of Public Works, in connection with the construction of a bridge on La Famine river.

Quebec, Province of.—A delegation of representatives of the County of Montmorency waited on Premier Taschereau recently in connection with the construction of the Quebec-Ste-Anne Highway. Premier Taschereau announced that the road would certainly be built and that plans are now being prepared.

Quebec, Province of.—Tenders will be received until 1 o'clock p.m., May 30 at the office of J. L. Perron, Minister of Roads, Parliament Bldgs., for the resurfacing of macadam on the Montreal-Ottawa highway within the municipalities of the village of l'Abord-a-Plouffe, of the parish of Ste. Dorothee and of the west part of the parish of Ste. Rose (about 62 miles).

Queenston Heights, Ont.—Contract awarded by Queen Victoria Niagara Falls Park Commission to Bennett and Lovejoy, of Toronto, at \$29,500, for construction of 4,100 ft. of macadam roadway 24 ft. wide. There were five other tenders submitted.

Riverside, Ont.—Tenders closed May 10 for construction of 1,300 ft. concrete sidewalk on Clairview, Elinor and John M.; 1,589 ft. sidewalk on Lauzon Road; 2,231 ft. of concrete sidewalk on St. Louis Ave. Clerk, C. J. McHugh, Ford, Ont.

Rockland, Ont.—Contract for construction of about 2,500 lin. ft. of bituminous roads on Main St. was awarded to McDonel & Dibble. Approximate amount of contract, \$16,000.

St. Catharines, Ont.—Tenders will be received, addressed to the Chairman, Board of Works, City Hall, until 5 o'clock p.m., Thursday, May 25, for the construction of approximately: 10,000 sq. yds. concrete foundation for pavements, including curbs and gutters; 6,000 sq. yds. cement concrete pavement; and 9,600 lin. ft. of concrete sidewalks. Plans and specifications on application to City Engineer, W. P. Near.

Saskatchewan, Province of.—Tenders will be received by H. S. Carpenter, Deputy Minister of Highways, Regina, until 12 o'clock noon, Tuesday, May 23, for construction of earth road from North of Watson to St. Gregor. Plans and specifications may be seen at the office of H. S. Carpenter, and at the office of W. Grant, 810 Canada Building, Saskatoon; J. R. Reid, Court House, Swift Current; W. T. Smart, Watson, Sask.; and F. G. Klusack, Dominion Grain Co., North Battleford, Sask.

Swan River, Man.—Tenders close May 16 for construction of approximately 6,200 sq. yds. of concrete sidewalks. Sec. Treas., A. E. Reed.

Sydney, N.S.—Tenders will be called by Board of Works for construction of Argyle St. bridge, estimated to cost \$7,500. An expenditure of \$1,500 on Townsend bridge is proposed.

Toronto, Ont.—Toronto Harbor Commission has made a request to the Board of Control that the city make appli-

cation to the Board of Railway Commissioners for an order permitting the construction of a new bridge over the railway tracks at the foot of Spadina Ave.

Welland, Ont.—Tenders will be received until May 24 by W. A. Swayze, Chairman, Welland, for the construction of 2½ miles of bituminous penetration road in Township of Crowland and 2 miles in the Township of Thorold and on the Peiham-Thorold Township line. Plans and specifications may be seen at the office of W. W. Brookfield, Box 1334, Welland, County Road Superintendent.

Welland, Ont.—Welland County Council awarded contracts for 9-ft. waterbound macadam road construction as follows: Three miles in Crowland Tp. to John Pirson, at \$8,490 per mile; 1¼ miles in Humberstone Tp. to R. G. Law, at \$6,000 per mile; 2 miles in Thorold Tp. to John Pirson, at \$8,490 per mile; 1¼ miles in Stamford Tp. to the Duferin Construction Co., at \$7,500 per mile. To Archibald Construction Co., 1¼ miles of 16-ft. waterbound macadam road in Pelham Tp. at \$13,990. If the Good Roads Committee can effect satisfactory arrangements with the latter contractor for an asphalt surface at an addition cost not to exceed \$1,750 per mile, this surface will be adopted. To E. G. Law, 2 miles in Bertie Tp. at \$15,750 per mile for a 16-ft. bituminous penetration paving with asphalt surface. Contract for 5 miles in Wainfleet Tp. was held open. Tenders were submitted for a 9-ft. road, but it is expected that this will be made a County-Provincial road at 16 ft. Action was deferred until June session of Council. Two tenders were submitted for a 9-ft. waterbound macadam road in Pelham Tp. Council considered tenders too high and the clerk was instructed to readvertise this, tenders to be considered at June session. Imperial Oil, Ltd. and Sun Co. of Canada, Ltd., submitted tenders on road oil. It was decided to ask bids covering the oil applied to the roads, and this matter also will be disposed of next month.

Woodstock, Ont.—By-law passed to construct a concrete curb and gutter on Oxford St., from Dundas to Drew, and a concrete sidewalk on the south side of Anne St., from Norwich Ave. to Maud St. Clerk, John Morrison.

WATER, SEWAGE AND REFUSE

Becton, Ont.—Village Council is issuing debentures amounting to \$6,000 for water works improvements. Clerk, Joseph Wright.

Crystal Beach, Ont.—Following tenders were received for 4,050 ft. of sewer and a 350,000 gal. per day Activated Sludge Disposal Plant; H. M. Balfour, Welland, \$56,228; F. F. Fry Co., Toronto, \$59,578; Central Foundation Co., \$59,799; Louis Sacco, \$60,500; Andrew Elsher, Niagara Falls, \$61,500; Robertson Construction & Eng. Co., Niagara Falls, \$65,000; MacNamara Bros., Sault Ste. Marie, \$65,947; Reid & Somers, Toronto, \$67,414; Canadian Engineering Const. Co., Hamilton, \$79,700; Flanagan Co., Fort William, \$79,990.

Dunnville, Ont.—Contract has been awarded to Turbine Equipment Co., Ltd., Toronto, to supply and instal one 150-h.p. motor-driven pump, one 150-h.p. gasoline engine, one 40-h.p. motor-driven pump, one 10-h.p. motor-driven pump, and one 25-h.p. combination gasoline-engine and motor driven pump. The gasoline engines will be supplied by the Sterling Engine Co., Buffalo, and motors by Canadian Crocker-Wheeler.

Dunnville, Ont.—Following tenders were received for a 1,200,000 gal. filter plant and equipment; Building only-Taylor Construction Co., \$22,900; Canadian Engineering & Construction Co., \$23,000; Pigott & Healey, \$24,900; Schultz Bros., \$25,500; W. H. Yates Construction Co., \$25,777; A. C. Stewart & Sons, \$26,548; F. F. Fry Co., \$27,976; Robert Bennett, \$33,340; Reid & Somers, \$34,523; and Somerville & Dilworth, \$35,790. Filter equipment only—Roberts Filter Co., \$11,779; Permutit Co., \$13,386; International Filter Co., \$14,785; New York Continental Jewel Filtration Co., \$14,891; Pittsburgh Filter Co., \$15,061. Combined tenders—Canadian Engineering & Construction

Co., \$35,900; R. L. Smith & Co., \$44,508. Pumps installed, Arthur S. Leitch, \$20,285; Turbine Equipment Co., \$20,950; Canadian Fairbanks Morse Co., \$20,313; Goldie & McCulloch Co., \$20,381; London Concrete Machinery Co., \$21,510; Storey Pump Equipment Co., \$22,454; Canadian Ingersoll-Rand Co., \$24,618. Pumps only—Clayton, Neil & Jones, \$14,135; Canadian Allis-Chalmers Co., \$14,590; S. B. Whiney, \$14,661; Canadian Blower Forge Co., \$15,346; Fraser & Chalmers, \$15,905. Contract was awarded as follows: Building and sedimentation basin, Canadian Engineering & Construction Co.; filter equipment, Roberts Filter Mfg. Co.; pump equipment, Turbine Equipment Co.

Goderich, Ont.—Town Council is selling an issue of \$14,997.15 sewer debentures. Treasurer, L. L. Knox.

Niagara Falls, Ont.—By-laws were passed by City Council providing for raising of \$18,469.36 and \$11,833 to pay for the construction of extensions of water mains on certain streets. City Clerk, W. J. Seymour.

Ottawa, Ont.—Contract for supply of one water meter testing scale has been awarded by the City Council to the General Supply Co. of Canada, Ltd., Ottawa.

Ottawa, Ont.—Contracts for supply of water meters for city have been awarded as follows: To General Supply Co. of Canada, Ltd., Ottawa, 75— $\frac{5}{8}$ -in. Buffalo meters; Neptune Meter Co., Toronto, 25— $\frac{3}{4}$ -in. Trident meters. 30—2-in., 6—3-in., 4—4-in., 2—6-in.; National Meter Co., New York, 1—8-in. Empire compound meter.

Pentticon, B.C.—Municipal Council awarded contract for 4,300 ft. of 4-in. water pipe to T. B. Ross & Co., of Victoria, at \$2,745, plus tax. Council also approved of an order amounting to \$1,809.20 being placed with the Taylor-Forbes Co., of Vancouver, for various fittings for domestic water extensions.

St. Catharines, Ont.—Tenders will be received, addressed to the Chairman, Board of Works, City Hall, until 5 o'clock p.m., Thursday, May 25, for the construction of approximately 9,200 lin. ft. of 10-in. to 36-in. sewers. Plans and specifications on application to W. P. Near, City Engineer. (See official adv.)

Todmorden, Ont.—A resolution was adopted at meeting of Todmorden Ratepayers' Association, that York Township Council be requested to secure the best sewerage scheme the engineers can propose for this district, with the estimated cost, same to be submitted to a vote of the people at an early date.

Toronto, Ont.—City Council intends to construct water mains in Evans and Forman Avenues at a cost of \$4,605. Also sewers in Cortleigh Crescent and Rosewell Ave., at cost of \$6,500.

Toronto, Ont.—Works Commissioner R. C. Harris advised the Board of Control that he is having plans and estimates prepared for a comprehensive sewerage system for the whole of North Toronto, involving an expenditure of several millions of dollars.

Toronto, Ont.—City Council passed by-law providing for raising of \$315,000 to provide for the cost of certain improvements and extensions to the water works system, as follows: For repairs and reinforcements to the water supply intake, \$200,000, and for 12-in. main on Yonge St., from Chaplin Crescent to north city limits, \$102,000, aggregating the sum of \$302,000.

Toronto, Ont.—Tenders, addressed to C. Alfred Maquire (Mayor), Chairman, Board of Control, will be received until noon, Tuesday, May 23, for the construction of the following sewers: Western Harbor Development Drainage System—Section 1, 2,000 ft. east of Parkside Drive to 1,478 ft. farther east; Section 2, Parkside Drive to Windermere Ave.; Section 3, Windermere Ave. to Jane St. Specifications may be seen at the Works Department, Room 6, City Hall.

Vancouver, B.C.—Civic Board of Works authorized construction of sewers at cost of \$48,060. City Engineer, F. C. Fellowes.

Winnipeg, Man.—The sum of \$50,000 is at the disposal of the Public Utilities Commission for the installation of water and sewer services.

Winnipeg, Man.—Civic Utilities Committee authorized construction of sewer in Ingersoll St., at cost of \$6,517, and a water main in Dominion St., costing \$848. Committee instructed City Engineer W. P. Brereton to bring in estimate of cost of giving residents on Telfer St. sewer service.

LIGHT, HEAT AND POWER

Calgary, Alta.—City Commissioners have recommended the purchase of a Lincoln arc welding outfit at a price of \$4,092 f.o.b. Calgary, from the Electrical Engineers, Ltd., Calgary.

Calgary, Alta.—Lee Drumheller has announced that steps have been taken by the Drumheller Land Co., Ltd., to erect a new generator to replace the one lost at the Callie mine fire recently.

St. John, N.B.—Common Council adopted a resolution authorizing a bond issue of \$900,000 for the erection of a civic Hydro distribution system.

Toronto, Ont.—Civic Property Committee sent on a recommendation to Board of Control for improved street lighting on Queen St., from Teraulay St. to Sunnyside, at a cost of \$17,000.

Winnipeg, Man.—Tenders close May 15 for erection of a switch house building for the Hydro-Electric System in Cornish Park. City Clerk, C. J. Brown.

Winnipeg, Man.—Contract for construction of a conduit connecting the present duct at Maryland bridge to Scotland Ave., Fort Rouge, was awarded to the Carter-Halls-Aldinger Co., of this city, for \$25,000, by the Civic Utilities Commission.

RAILWAYS

Kingston, Ont.—Canadian Pacific Railway Co. plans to spend \$50,000 in building an overhead crossing over the Grand Trunk tracks immediately west of Kingston.

Medicine Hat.—Work has started on the construction of a 280-ton mechanical coaling plant for the C.P.R. Contractor, G. E. Hughes, of Calgary.

Saugeen Junction, Ont.—Township of Osprey wants a branch line of the C.P.R. extended from Saugeen Junction, on the Owen Sound branch of the road, to a point in Collingwood or Osprey Township.

FACTORIES AND LARGE BUILDINGS

Birch Cliff, Ont.—Tenders totalling \$132,000 for the erection of High School in Scarboro Township to the Carswell Construction Co.

Blairmore, Alta.—Contract awarded to E. J. Pozzi for erection of two-storey brick building.

Blairmore, Alta.—Mark Sartoris' wholesale house, damaged by fire, will be remodelled by C. Ericson.

Brantford, Ont.—Dominion Dress Goods Co. will erect a new three-storey factory building at South and Alfred streets.

Brantford, Ont.—It is stated that a local textile industry has plans for large extensions. City Clerk, H. F. Leonard.

Brantford, Ont.—The Terrace Hill public school will be built if the almost unanimous recommendation of the buildings and grounds committee of the Board of Education is accepted by the Board as a whole at its next meeting. Estimated cost, \$150,000.

Calgary, Alta.—Ford Motor Co. plans immediate start on construction of building on Eleventh Ave. at an approximate cost of \$150,000. Local Manager, H. R. Cottingham.

Calgary, Alta.—Superintendent of the Street Railway has been authorized by the City Council to purchase steel rails from the Moose Jaw Street Railway Co., at a price of \$25 per ton f.o.b. Moose Jaw. This makes a price with freight of approximately \$33.77 per ton f.o.b. Calgary for a total expenditure of \$5,403.20.

Chatham, Ont.—Plans for proposed Technical School were submitted to the Board of Education by John Methven. Plans call for a three-storey fireproof building of reinforced concrete with brick facing costing \$300,000.

Colborne, Ont.—A site has been selected for proposed new High School building.

Cornwall, Ont.—Contracts for addition and alterations to Cornwall Public School awarded as follows: General contract, Charles Holbrook & Sons, Ottawa, \$55,000; plumbing, heating and ventilating, McKinley & Norwood, Ottawa, \$19,300.

Daysland, Alta.—Work will start at once on erection of creamery building for E. C. D. Creameries. Supt., J. P. Donald, of Edmonton.

Durham, Ont.—Movement on foot for erection of new Town Hall. Clerk, Wm. E. Vollet.

East Zorra Tp., Ont.—Township Council passed by-law authorizing raising of funds for erection of school house in S.S. No. 6. Clerk, Edwin Parker, Tavistock, Ont.

Edmonton, Alta.—Finance Committee recommended to City Council purchase of a site for a children's home to cost about \$35,000. City Clerk, C. E. K. Cox.

Edmonton, Alta.—E. L. Hill, Secretary, Library Board, has received word that building of a new public library must proceed during the present construction season if advantage is to be taken of the \$112,500 grant from the Carnegie Corporation.

Edmonton, Alta.—Building of the Edmonton, Dunvegan and B. C. Railway line towards the British Columbia boundary will be continued this spring according to an announcement made by Charles Murphy, general manager of the Canadian Pacific Railway western lines. This railway is now being operated by C.P.R.

Fort William, Ont.—Stores and workshop sections of the Northern Engineering Co., comprising the newest wing of the plant owned by W. J. Ross were destroyed by fire, the loss being about \$25,000.

Fort William, Ont.—Bulk tenders were received by the City Council for track construction, but were rejected as being too high. Tenders are being called for separate jobs, such as track construction, ditching and overhead work.

Fort William, Ont.—C. P. R. Co. has awarded contract for the second new elevator here to the McDonald Engineering Co., of Chicago. Structure will be of steel and will be fireproof, with a capacity of 2,500,000 bushels. Estimated approximate cost, \$1,500,000. Work will start at once.

Fort William, Ont.—Over half a million dollars will be spent by the Canadian Pacific Railway Co. this summer upon improvements to their big coal docks on Island No. 1, at the mouth of the McKellar River. The improvement will consist of a huge storing or distributing crane and the general enlargement of the coal handling and storage facilities of the docks.

Galt, Ont.—Tenders, addressed to Newlands & Co., Ltd., will be received until noon, Tuesday, May 30, for the excavating for, and the erection of a new mill building. Tenders for separate trades and in bulk will be considered.

Hamilton, Ont.—Plans for proposed Bank of Hamilton branch at the Delta have been forwarded to the city building inspector. Cost, \$40,000. Delta Properties, Ltd., plan erection of building at the Delta at approximate cost of \$150,000.

Hamilton, Ont.—Bank of British North America building, 12 King St. east, has been purchased as headquarters of Hamilton Hydro-Electric system. Alterations and extensions costing \$65,000 will be made. Secretary of Commission, W. H. Childs.

Hespeler, Ont.—Municipal authorities have received a grant of \$12,250 from the Carnegie Trust Corporation towards the erection of a library building. Total cost, \$18,500. Clerk, M. E. Jardine.

Humberstone, Ont.—Separate and bulk tenders for all trades required for the erection of a 4-room public school will be received by L. R. Snider, Sec.-Treas., until noon,

Tuesday, May 23. Plans and specifications may be seen on application to the Secretary-Treasurer and Norman A. Kearns, Architect, Welland.

Kensington, P.E.I.—Fire destroyed the new mill of the Kensington Sash and Door Factory, owned by Messrs. Barnard. Loss, \$6,000.

Kirriemuir, Alta.—Tenders will be received by J. L. Jamieson, Superintendent, until May 20, for the construction of a standard section house. Further information may be obtained at the Canadian Pacific Railway station, Edmonton.

La Fleche, Sask.—Roman Catholic church building will be erected here at cost of \$20,000.

Lakefield, Que.—Canada Cement Co., Ltd., will commence work at once on the reconstruction of their plant here. Construction Engineer, J. A. Creaser.

Lewvan, Sask.—Tenders closed May 11 for erection of a school building for Centre View School District No. 4460. Sec.-Treas., L. H. Harker, Lewvan.

Lindsay, Ont.—Town Council passed by-law to construct or improve the highway on Colborne St., from Angelina St. to William St. Clerk, W. R. Allely.

London, Ont.—Civic Commission decided to recommend to City Council that new Municipal Building be erected on site of present City Hall.

London, Ont.—Ground has been broken for the new plant of the London Bridge Works, Ltd., which will be of modern steel fireproof construction throughout and equipped with the latest machinery for the production of steel structures of all kinds, chiefly bridges and buildings. An extensive warehouse will also be built and equipped for the distribution of iron and steel products. President, T. J. Dillon, Welland.

Melbourne, Ont.—Arrangements are being made to start work shortly on the new school building. Trustee, Dr. Dewar.

Melbourne, Ont.—Tenders will be received by W. J. Laing, Secretary, Melbourne, until 5 p.m., May 20, for the erection of a red brick Continuation School. Plans may be seen on application to the Secretary and also at office of W. G. Murray, Architect, London, Ont.

Mildmay, Ont.—Establishment of a continuation school here is under consideration. Clerk, John A. Johnston.

Moncton, N.B.—J. A. Roy plans erection of business block on corner of North and Union Streets. Estimated cost, \$10,000.

Moncton, N.B.—Contract for construction of service station for Simms, Ltd., has been awarded to the Parsons-Ed Co., of this city.

Montreal, Que.—Permit issued to the Protestant School Board to extend the present school building on Canning St. with a 92 by 62 ft. addition.

Mount Dennis, Ont.—Members of Mount Dennis Methodist church plan erection of new church building at cost of \$30,000. Pastor, Rev. D. R. Gray.

Nipigon, Ont.—Enlargement of Nipigon Fibre Pulp & Paper Company's plant is planned.

Ojibway, Ont.—Ward E. Perley, Vice-President of the Canadian Steel Corporation, announced that building activity on the company's \$20,000,000 plant now under construction, will be increased in the near future.

Oshawa, Ont.—R. S. and George W. McLaughlin, President and Vice-President, respectively, of the General Motors of Canada, announced that they will erect a maternity wing to the Oshawa Hospital, to be known as the McLaughlin Memorial Wing.

Ottawa, Ont.—Fire destroyed a portion of the Barrett Bros. sawmill and storage houses.

Ottawa, Ont.—Members of St. Luke's Church plan erection of new church building. Rector, Rev. J. E. Lindsay.

Ottawa, Ont.—School Board will call tenders for erection of administration building on corner of Gilmour and O'Connor Sts. and for an addition to Kent St. School.

Ottawa, Ont.—Contracts for masonry, brick and carpentry work for main building of new civic hospital awarded to A. I. Garvoek at \$220,884. A tender was also received from T. C. James, at \$298,854.

Ottawa, Ont.—New tenders are to be called for the masonry, brick and carpentry work for the main building of new Civic Hospital. This is necessitated by an error in price made in tendering by Alex. I. Garvock, to whom the contract was awarded.

Ottawa, Ont.—The Gilmour Construction Co. were awarded contracts for Cambridge St. and Glashan Schools in bulk, at \$27,297 and \$34,302.32, respectively. Other bulk tenders received were: T. C. James, \$30,460 and \$35,489 and The Bate-McMahon Co., \$32,793 and \$39,742.

Ponoka, Alta.—Plans are being prepared by R. P. Blakey, Provincial Architect, for a new unit of the buildings of the asylum for the insane here. Tenders will be called in about a month's time.

Portage la Prairie, Man.—Canadian National Railways plan the laying of heavy steel between Portage and Brandon and Brandon and Kipling this year.

Preston, Ont.—Hurlbut Shoe Co. will enlarge its plant.

Quebec, Que.—Tenders for construction of School of Tres St. Sacrement were received until May 13 by Antoine Taschereau, Sec.-Treas., Roman Catholic School Commission, Parliament Bldgs.

Riverside, Ont.—Enlargement of Edith Cavell school at cost of between \$30,000 and \$40,000 is proposed. Architect, G. B. Colthurst.

Regina, Sask.—Contract for construction of Roman Catholic chapel on Northside has been awarded to D. J. Murphy.

Regina, Sask.—Western Development Co., Ltd., will erect large building on Hamilton St., for which contract has been awarded to the Poole Construction Co.

St. Mary's, Ont.—Town Council granted \$19,000 for improvements to the Collegiate Institute.

St. Mary's, Ont.—Ratepayers passed by-law to guarantee \$20,000 bonds for new factory of the Hurlut Shoe Co.

St. Thomas, Ont.—Frank H. Alfred, president of the Pere Marquette Railway, announced here that a new depot costing \$30,000 is to be erected in Sarnia this year and a large section of the Canadian division roadway improved.

St. Thomas, Ont.—A by-law providing for the issuing of \$260,000 in debentures to cover the cost of erecting and equipping a vocational school is to be submitted to the ratepayers at an early date.

St. Williams, Ont.—Fire destroyed the furniture factory and planing mill of McCall & Co. together with dry kiln and two large lumber sheds.

Sarnia, Ont.—Ratepayers passed by-law granting fixed assessment to Dominion Alloy Steel Corporation, the \$5,000,000 company which is to erect a plant here.

Silverthorn, Ont.—Congregation of Silverthorn Methodist Church plan erection of new church building at cost of \$30,000. Pastor, Rev. W. J. Aldridge.

Sydney Mines, N.S.—Competitive plans for an 8-room fireproof school building will be received until May 20, by D. C. McDonald, cost to be not more than \$70,000.

Sydney Mines, N.S.—School Board plans erection of school at cost of \$75,000. Bank of Nova Scotia plans erection of office building, work to commence about June 1.

Toronto, Ont.—City Architect's department issued permit for an extension to a large bowling alley at cost of \$45,000.

Toronto, Ont.—City Council passed by-law providing for raising of \$25,000 for purchase of site for proposed Observation Home.

Toronto, Ont.—Standard Bank is ready to begin erection of a new building for their Bedford Park branch on Yonge St., opposite Bedford Ave.

Toronto, Ont.—City Council passed by-law providing for the raising of \$100,000 for the erection of a Nurses' Home for the Isolation Hospital.

Toronto, Ont.—By-laws passed by City Council providing for raising of \$91,000 for purchase of site for proposed new Police Administration building.

Toronto, Ont.—Members of Morningside Presbyterian Church plan erection of Sunday School building at cost of \$50,000. Pastor, Rev. J. Gordon Cheyne.

Toronto, Ont.—Campaign to raise \$40,000 for erection next fall of new church building has been launched by members of St. Clair Avenue Baptist Church.

Toronto, Ont.—Lakeview public school trustees decided to build a four-room addition to the school north-east of Stop 35, and a two-room unit for a school east of Stop 34.

Toronto, Ont.—Separate and bulk tenders will be received until May 20, at noon, by J. M. Cowan, Architect, 3 Carlton St., for all trades required in the erection of 4-room addition to St. Rita School, Edwin Ave., for the Trustees of the Toronto Separate School Board. Plans and specifications may be obtained at office of architect.

Toronto, Ont.—Separate School Board awarded following contracts in connection with erection of school in Moore Park: Carpenter work, Hickey Construction Co., \$11,500; masonry, F. Holmes & Son, \$21,490; heating, T. E. Regan, \$4,100; plumbing, V. E. Winpenny, \$3,500; structural J. J. Glynn, \$1,675; electric wiring, Moss & Hock, \$460; steel, MacGregor & McIntyre, \$1,549; plastering, Beaver & Co., \$1,450; painting, A. Richard, \$1,395; roofing, etc., marble work, J. G. Gibson Co., \$1,280.

Vancouver, B.C.—Permit issued for erection of warehouse for Shell Co. at cost of \$4,000.

Vancouver, B.C.—Permit issued for new school to be erected on Quebec St. by St. Patrick's parish. Cost, \$30,000.

Victoria, B.C.—Fire damaged Arcade Building to extent of \$250,000.

Victoria, B.C.—Contract for erection of business block on southeast corner of Douglas and Fisgard Sts. for Thos. R. Cusack and associates has been awarded to Luney Bros., Ltd. Cost \$20,000.

Victoria, B.C.—Members of Gizeh Temple (Shriners) of this city are agitating for the erection of a hospital for crippled children in this province. Executive of Royal Jubilee Hospital have offered a site for this purpose in this city.

Welland, Ont.—Permit issued to St. Thomas Packing Co. for erection of plant at corner of Hellesms Ave. and Division St.

Welland, Ont.—Tenders have been called by Empire Cotton Mill for construction of addition to factory. General Manager, J. D. Payne.

Welland, Ont.—The plant of Electric Steel & Metals, Ltd., it being taken over by a Pittsburgh syndicate and a large extension will be built to the plant.

Weston, Ont.—By-law providing for the raising of \$115,000 for addition to High School will be submitted to ratepayers. Clerk, J. H. Taylor.

Winnipeg, Man.—Work has started on construction of \$250,000 I.L.O.O.F. Home by Grand Lodge of Manitoba.

Winnipeg, Man.—Tenders will shortly be called for construction of \$500,000 film exchange building on Ellice Ave.

Winnipeg, Man.—Preliminary steps toward construction of an office building for the use of dentists and physicians have been taken here.

Winnipeg, Man.—Plans are being prepared for two new schools, a 14-room school at Mountain Ave. and Parr St., and a 14-room school on Grosvenor Ave.

Winnipeg, Man.—Permit issued for \$12,170 for an addition to Cecil Rhodes School, and another for \$18,000 for an addition to Lord Nelson School No. 2.

Winnipeg, Man.—Contract for construction of 14-room school on Schultz St., between Flora and Stella Sts., has been awarded to Hazelton & Walin, Ltd., of this city, for \$66,123, contract for installation of heating and ventilating system has been awarded to Bowyer Boag, Ltd., for \$13,865. Other tenders received were: General contract—Sutherland Construction Co., \$67,900; Fraser & McDonald, \$73,998; Carter-Halls-Aldinger Co., \$67,729; Smith Construction Co., \$79,284.13; H. Sigurdson, \$72,453; J. P. Tremblay Co., Ltd., \$69,975; J. McDiarmid Co., Ltd., \$70,800; Fort Garry Construction Co., \$68,942; Wallace and Atkins, Ltd., \$67,547; S. Brynjolfsson & Co., \$68,724; Claydon Co., Ltd., \$66,586. Heating and ventilating, Bowyer-Boag, Ltd., \$13,865; Cotter Bros., Ltd., \$13,937; Green

and Litster, Ltd., \$14,695; James Ballantyne Co., Ltd., \$14,987; Keller & Whitfield, \$14,990; John Plaxton Co., Ltd., \$15,560; Standard Plumbing & Heating Co., \$14,878; Chas. D. Kirk Co., \$11,700; Chas. Gate & Sons, \$15,300.

Woodville, Ont.—Tenders either in bulk or for separate trades required in the erection of Public and Continuation School, will be received until 8 o'clock p.m., Friday, May 19, by A. Good, Secretary, Woodville S.S., Woodville, Ont. Plans and specifications may be seen either at Woodville or at office of John T. Hornsby, Architect, 4 William St. North, Lindsay, Ont.

MISCELLANEOUS

Baker Brook, N.B.—Losses estimated at \$100,000 were caused by fire which destroyed the shingle mills of the Fraser Companies, Ltd., the C. N. R. section house, the Temiscousta Railway bridge, etc.

Brantford, Man.—Contract for city's annual supply of castings awarded to the Hartley Foundry Co., Brantford.

Calgary, Alta.—City Commissioners have recommended the purchase of a 1-ton International gasoline truck from the International Harvester Co., at \$1,975 f.o.b. Calgary.

Edmonton, Alta.—Contracts for about 1,000 miles of rural telephone line extensions awarded by Provincial Telephone Department as follows: A. McGregor, James Mohler, Albert Olsen, Berwick & Cowherd and J. Glover. Tenders were for labor only and totalled \$100,000. Tenders will be called for in June or July on next lot of work to be taken up this season. Contract for one-storey branch office for the telephone department at Hillhurst, Calgary, was awarded to Gouley & Vanderhogan, of Calgary.

Kapuskasing, Ont.—If the plans of J. A. Ellis, Director of the Provincial Bureau of Municipal Affairs, are approved, Kapuskasing in New Ontario, will be laid out on a model town-planning design.

Lachine, Que.—Following contracts for supply of materials awarded: Stone, sand, cement and clay pipe to Le Pallleur Freres, Ltd.; Lachine; bitumen, Barrett Co., Ltd., Montreal; paving, Leger & Charlton, Ltd., Lachine.

Lethbridge, Alta.—Considerable progress has been made thus far in the negotiations between the Government, the C. P. R., the Southern Irrigation District and the farmers concerned in the expansion of the Canadian Pacific Irrigation system in the south and east areas, a scheme which may ultimately bring under water right double the present C. P. R. block acreage, or approximately 160,000 acres. The construction of a new dam and headworks at Kimball, estimated to cost over \$200,000, will be proceeded with providing the negotiations now in progress are successful.

Mimico, Ont.—Town Council sold an issue of debentures amounting to \$98,000 for the following purposes: School purposes, \$65,000; sewage disposal plant, \$13,000; and Hydro, \$20,000.

Oakville, Ont.—Oakville Ratepayers' Association passed a resolution asking the Town Council to appoint a town-planning commission, or committee of Council, to take charge of the lay-out of sub-divisions, laying of streets and sidewalks, and to have general supervision over all building and general layout of town improvements, both inside the town and for a radius of three miles beyond the limits of the corporation.

Ontario, Province of.—Provincial charters granted to following companies: Lower Sturgeon Power Co., Limited, Toronto, capitalization, \$600,000, director, John H. Black; Night Hawk Peninsular Mines, Ltd., Toronto, capitalization \$5,000,000, Geo. A. Grover, director.

Ottawa, Ont.—Following are names of companies incorporated under Dominion charter, with head office, authorized capital and name of one director: Jefferson Mines, Ltd., Jefferson Mines, \$2,500, Geo. E. Buchanan; Fibre Asphalt Products, Ltd., Toronto, \$600,000, W. H. Price;

Inter-Provincial Plastering Co., Ltd., Windsor, \$10,000, Stanley R. Ratcliffe; Radio Heating System, Ltd., Montreal, \$250,000, Jos. Vigneault.

Ottawa, Ont.—At a recent meeting of the Town Planning Commission, which was attended by a large number of property owners and representatives of public bodies, Chairman Noulan Cauchon explained the plans of the Sherwood Drive, for the widening of Fairmont Ave., the extension of Reid Ave. to Armstrong St., the extension of Ruskin St. to Fairmont Ave. and the improvement of street railway accommodation to the new civic hospital.

Quebec, Province of.—Following companies have been incorporated under Provincial charter: Association of the Electrical Contractor Dealers of the Province of Quebec, Inc., Montreal, capitalization, \$50,000, Nazaire Simoneau, director; Wireless & Electric Co., Ltd., \$20,000, Anatole Rioux.

Revelstoke, B.C.—The auto road up Mount Revelstoke is to be pushed to completion this season, according to an announcement received from L. W. Humphrey, M.P., who states that he has the assurance of the Dominion Works Department that operations will be resumed on the road shortly. An appropriation has also been authorized for the prosecution of a survey of the Columbia River at Revelstoke.

Sarnia, Ont.—Ratepayers passed a by-law authorizing expenditure of \$28,000 on fire-fighting equipment. City Clerk, M. D. Stewart.

Saskatchewan, Province of.—Tenders for construction of a drain will be received by H. S. Carpenter, Deputy Minister of Highways, Regina, until 12 o'clock noon, Saturday, May 20. Several culverts and bridges will be constructed and approximately 9,000 yds. of earth removed.

Vancouver, B.C.—Provincial charter granted to Perry Contracting Co., Ltd. Capitalization, \$10,000.

Victoria, B.C.—Provincial charter granted to M. C. Mining Co., Ltd. Capitalization, \$500,000.

West Luther Tn., Ont.—Tenders will be received by W. W. Duncan, Clerk, Conn P.O., Ont., until 4 o'clock, May 27, for the construction of a municipal drain, containing about 20,300 cu. yds. of excavation. Plans and specifications may be seen at the clerk's office.

Tenders Called For

CITY OF ST. CATHARINES, ONT.

TENDERS FOR SEWERS, PAVEMENTS, SIDEWALKS.

SEALED TENDERS will be received addressed to the Chairman of the Board of Works, City Hall, St. Catharines up to 5 o'clock p.m. of Thursday, May 25, 1922, for the construction of approximately:—

9,200 Lineal Feet of Sewers from 10 in. to 36 in. in diameter.

10,000 Square yards of Concrete Foundation for Pavements, including curbs and gutters.

6,000 Square yards of Cement Concrete Pavement.

9,600 Lineal Feet of Concrete Sidewalks.

Plans, profiles and specifications may be seen at and forms of tender obtained from the office of the City Engineer. Envelopes containing tenders must be plainly marked as to contents. All tenders must be accompanied by a marked cheque for five percent. of the amount of the tender together with the name of an approved guarantee company.

The lowest or any tender is not necessarily accepted.

W. P. NEAR,

City Engineer.—326

The Canadian Engineer

A Weekly Paper for Civil Engineers and Contractors

High Level Concrete Bridge, Elora, Ont.

Two Span Reinforced Concrete Arch Structure 85 ft. High Replaces Steel Truss Structure — Old Trusses Utilized as Support for Ribs During Concreting — Deck Supported by Ribs — Old Masonry Utilized

By A. W. CONNOR

Consulting Engineer, Toronto.

CERTAIN unusual constructional features were adopted in the new high level reinforced concrete arch bridge completed last autumn over the Irvine River near Elora, Ont. This stream flows into the Grand River at Elora through a deep, rocky gorge about 120 ft. wide by 80 ft. in depth. The Grand River falls into the same gorge not far above the confluence.

FIG. 1—COMPLETED BRIDGE AT ELORA, SHOWING OLD MASONRY PIER

There is a 4-span steel bridge over the Grand River just above the falls, and the new concrete bridge was constructed by the County of Wellington over the Irvine River at a point a few hundred yards from the confluence with the Grand. The first bridge was built here about 1853. Long timbers were run out from either side and lashed together by two sailors brought up from the Atlantic coast. These were then trussed up and the wooden bridge completed. In 1887 a masonry pier was built in the gorge and the old bridge was replaced by a steel deck bridge of two 60-ft. spans. This bridge has been in service ever since and was used to advantage in the erecting of the new concrete arch bridge.

The old pier was in excellent condition, having been constructed by English masons and the stones bonded together with iron anchors. It was 10 by 24 ft. at the base, tapering to 4 ft. 3 in. by 18 ft. at about the spring of the new arch. At this elevation there was a 6-in. offset and the upper part was carried up plumb. The pier was used without alteration below this bridge. Above this ledge, recesses were cut on the sides to receive the new arch ribs. After the ribs had set and some weight could be taken off the shores of the bridge, the pier was cut down to make room for the concrete columns and above the extrados narrowed, for appearance to the width of the columns.

New Superstructure

The new bridge, shown in Figs. 1 and 2, consists of two open-spandrel arch spans of 61 ft. with a 19-ft. road-

FIG. 2—CONSTRUCTION OF DECK FORMS, SUPPORTED BY ARCH RIBS

way and a 5-ft. sidewalk on one side. The clear distance face to face of abutments is 123 ft. and the height of the floor above the water is 85 ft. The bridge is designed for a uniformly distributed live load of 135 lb. per sq. ft. or

for a concentrated load of 20 tons, being class "C" loading of the specifications of the Ontario Department of Highways.

There are two parabolic arch ribs with a rise of 12.2 ft. 24 in. thick and 30 in. deep at the crown. The ribs are 12 ft. 4 in. apart in the clear, being just wide enough to permit the forms to clear the old steel trusses. The overhang of the brackets is 5 ft. 10 in. on the sidewalk side and 3 ft. 10 in. on the other. The arches contain 7 panels of 3 ft. 10 in. with semicircular spandrel slab arches. The deck consists of a 10½-in. concrete slab on the roadway and a 4-in. slab for the sidewalk, carried by floor beams at the panel points. The railing is 4 ft. high on the sidewalk side and 4 ft. 6 in. on the roadway side, the sidewalk being 6 in. higher than the road. The open panels and top rail of the balustrade were precast, the former in two sections.

Erection Without Falsework

On account of the height of the structure, it was designed for erection without falsework, using the old steel trusses to support the new arch ribs. It was found that the old bridge was just strong enough to carry the ribs without the deck. To provide extra security, the forms for the ribs were built to act as an arch, with a horizontal tie consisting of old lateral rods used when the rib was being poured. The old bridge was a 5-panel, pin-connected deck, 60-ft. span with 12-in. I's 16 ft. long over the trusses which were 11 ft. centre to centre. It was arranged to allow the two centre I-beams to pass under the arch ribs. By putting 2-in. fillers under the other beams, they just passed over the ribs. The weight was carried to them by heavy iron stirrups. Each rib was poured uniformly from each end and a key section poured the following day. As the load on the truss was eccentric, the platform over the unloaded truss was counter weighted with stone. As each rib was being poured, a point on the formwork was sighted from a transit and constantly watched against tipping or undue settlement. The latter was about as expected, namely ⅝ in.

By the time the formwork for the deck was completed, the ribs had set sufficiently to carry the weight of the deck. This weight was distributed between the old trusses and the arch ribs. To secure equal settlement, the two systems were tied together.

The two central floor beams pass through the ribs. The steel was inserted and recesses 3 in. deep were left for the bearing of the beams. Expansion is provided in the deck at the ends and over the centre pier, the floor beam at this point being deeper and wider than the others.

The sidewalk slab was cast after the roadway and sidewalk brackets were completed. Curbs were cast with a slot for the precast panels, the rods for the posts being left projecting. The upper precast rail was cast with a groove to fit over the panel. Post forms were clamped around the panels and rails and poured to bind all together.

Conduits for electric wiring were cast into the curbs. The standards for the lights are also of precast concrete.

The total length of the structure with wing walls is 181 ft. 9 in. There are 311 cu. yd. of concrete and 15 tons of steel in the work. The cost of the bridge was \$15,200. Tenders were also called for a steel superstructure but the cost would not have been much less, so the Council decided to build a structure more in keeping with the surroundings. The contractors for the work were Reid & Somers, Ltd., of Toronto. The bridge was built by the County of Wellington, the writer acting as the engineer.

The Moncton Branch of the Engineering Institute of Canada held their annual meeting on May 16, when the following officers were elected: Chairman, F. B. Tapley; Vice-Chairman, F. H. Fripp; Sec.-Treas., M. J. Murphy; Executive, G. C. Torrens, J. G. Dryden, A. S. Gunn, C. S. G. Rogers, Prof. McKel, Kenneth Gordon.

HEAVY TRUCKS DAMAGE ROAD SURFACE

AT the annual meeting of the Ontario Motor Truck Owners Association, held in the King Edward Hotel, Toronto, on May 11, Hon. W. A. McLean, Deputy Minister of Highways for the Province, declared that it would cost the Government five hundred millions of dollars to put the Provincial Highways system into such shape that it would efficiently stand up under the wear and tear of loads carried by ten and twelve-ton motor trucks. Pointing out that expenditure on such an enormous scale was unthinkable, the Deputy Minister further stated that the only other alternative was the restriction of loads to be carried by trucks.

Although not suggesting any definite limit, Mr. McLean asked the truck owners to be reasonable in loading their vehicles, as the question was one which eventually would vitally affect their standing with the public. Mr. McLean outlined the development of motor bus and motor express traffic and ventured the prophecy that a very few years would see a phenomenal increase in these two types of traffic over Ontario roads.

S. L. Squire, of the Canadian Good Roads Association, also offered friendly warning to the truck owners in the matter of heavy loads. If you disregard common sense and reason, you will arouse public opinion to a point where it will declare that trucks will have to be kept off the roads. The service which the truck can render is an important one, but we do not go on loading trucks for some selfish reason to the point where they will break down the road foundation.

WEATHERPROOFING HUDSON RIVER BRIDGE

PROTECTION of the proposed bridge over the Hudson River from the weather by means of bronze has been recommended by the Engineers of that structure. The plan to weatherproof the bridge with bronze is described in the bulletin of the Copper and Brass Association, New York City.

A new and highly important feature introduced for the first time in a bridge of this great magnitude is that practically the whole of the Hudson River Bridge will be weatherproofed. That is to say, its steel work will be so completely enclosed with rain-and-moisture-excluding bronze, that the annual cost of repainting—a most serious item in the upkeep of big bridge—will be reduced to a minimum.

That this little matter of protection figures in maintenance economy and is indeed vital, is realized when it is understood that it is expected to reduce the cost of painting, which, if the entire surface of the steel structure were exposed, might easily amount to \$500,000 annually, and as only about 15 per cent of the structure will be exposed to the weather, the upkeep will be reduced accordingly.

In the Hudson River Bridge there are a pair of suspension trusses or inverted arches spaced 160 ft. apart, center to center, each truss consisting of 2 cables from 60 to 80 ft. apart vertically, with vertical panels and diagonal bracing between to supply the stiffening under passing loads. From the two suspension trusses vertical eyebars are suspended, and carry the double-deck floorway.

On the proper strength, functioning, and permanence of the chains depends the integrity of the bridge. Each eyebar is separated several inches from the adjacent bar, so that it can be inspected at any and all times. Each cable is enclosed in a covering or gallery of bronze for protection and to permit of inspection, so that once the eyebars are painted they will be well protected from the elements.

The chord thus assembled is 11 ft. in thickness, as compared with 15 in. for the wire cable of the Brooklyn Bridge, and with the enclosing covering is 15 ft. in external diameter. The estimated cost of the bridge proper has been placed at \$100,000,000. By the use of the bronze as a protection against the weather, a yearly saving in upkeep of more than \$400,000 is expected.

TREATMENT OF HARD, IMPURE WATER WITH ALUMINIUM SULPHATE*

Action of Alum in Water — Amount of Alum Can Only be Determined by Experiment — Principles Underlying Coagulation — Hydrogen ion Concentration.

By William Gore,
Consulting Engineer, Toronto.

THE art of treating water with aluminium sulphate ("alum," for short) for purposes of coagulating the impurities of color, turbidity or micro-organisms, in order to condition it previous to filtration or to settlement with or without filtration, is essentially experimental. In spite of the many researches that have been carried out into the problem, no one can at present determine the necessary amount of alum or the time required for the reactions to take place or the amount of residual alum in the filtrate in any given instance from a mere study of the salient characteristics of the water. This situation arises from the multiplicity of the important factors involved, and their interactions are such that in practice the problem becomes too unwieldy.

Notwithstanding this, great strides have been made in the study of the problem by various methods including that of abstraction, and a number of mile posts have been fixed along the road towards the complete solution of the problem.

In the treatment of drinking water with alum, the alkaline bicarbonates of calcium and magnesium existing naturally in the water are relied upon to decompose the alum in solution and to form insoluble aluminium hydrate, which is the active agent of coagulation; and as these bicarbonates are almost always present in abundance in hard waters, there will always be sufficient present to satisfy the chemical requirements of this reaction. This was practically all the text on the subject at one time considered to be necessary. But a little practical experience shows this to be by no means the case.

General experience has shown, and it has been confirmed in systematic experiments by Morison¹, Pirnie² and others, that increased quantities of bicarbonates in a water demand increased quantities of alum to treat it, and, as might be expected, the same applies to increased contamination and turbidities, but the law of increase is different in the two cases. In the former the action is often, although not always, such as would be expected if a certain amount of the alum floc went into solution or in some way failed to precipitate, and in the latter case the results are so very uncertain because of the uncertainty of the nature of the contamination. As an instance of the difficulty of estimating the effect of a contamination, it has been found in laboratory experiments that one part in a hundred million of gelatine dissolved in Lake Ontario water made coagulation exceedingly difficult.

Some interesting laboratory experiments on the effect on visual precipitation of clay and silica turbidities of various mineral salts when treated with alum have been made by Smith³. This visual effect, although somewhat different from the complete process involving filtration, does show that each substance has an effect of its own, and demonstrates how difficult must be the problem of predetermining the alum treatment for a natural hard water which contains many mineral matters. It is inter-

¹Morison, Capt. J. The Dose of Alum for Clarification of Water by Precipitation. Indian Journal Medical Research, Vol. III., No. 4, April, 1916.

²Pirnie, M. Application of Colloidal Chemistry to Study of Filter Effluents. Journal Amer. Water Works Association, Vol. IX., No. 2.

³Smith, Otto M. The Removal of Clay and Silica from Water. Journal Amer. Water Works Assn., Vol. VII., page 302.

*Paper read before Canadian Section of American Water Works Association at Brantford, Ont., May 13, 1922.

esting to note that soda ash, which has been used as a corrective for acidity in the alum treatment of very soft waters, showed a distinctly inhibitive effect on the clarification of the water by alum. The same applies to the bicarbonate of soda and most sodium compounds; in fact nearly all substances experimented with had an undesirable influence on final clarification.

Closer studies of precipitation in the light of colloid chemistry have shown that the process goes through various phases as the application of the alum is increased, and the experiments of Morison¹ previously referred to are exceptionally interesting in this particular. They show clearly there is an optimum amount of alum which increases with the alkalinity of the water; and, in addition, that coincident with the optimum amount of alum, no residual alum was found in the supernatant liquid but was found there at every other concentration. In these experiments the optimum amount of alum runs rather less than half the equivalent alkalinity, and it would be interesting to know if this relation is always the same.

The question of the existence of alum in filter effluents has been closely studied by Howard^{4,5} and Hannon and Wolman⁶, who have found that effluents from all treated waters examined gave residual alum reactions. In the case of Lake Ontario water at Toronto, it was demonstrated that the residual alum after filtration was a hydrate in colloidal form which subsequently became an aluminate the exact nature of which has not been determined.

Stein's⁷ experiments on the removal of tannic acid color by alum cover a wide range of both acid and alkaline waters and shows with the latter waters that aluminium hydroxide, although actually formed, is inhibited from precipitating by the tannic acid until an equivalent amount of aluminium hydroxide has formed, and this part of the subject has been worked out with considerable detail and should prove invaluable to filter operators.

Very few of the reactions that follow from the laws of ordinary chemistry take place in their entirety, or some of the expected precipitates do not show up in whole or in part. This is particularly noticeable in the weak solutions of chemicals used in the treatment of drinking water, and colloid chemistry treats of this branch of the subject. In the purest of pure water, about one in every six hundred thousand of the water molecules appears to be broken up into two fragments, one hydrogen nucleus constituting one fragment, and one hydrogen atom, one oxygen atom and one electron constituting the other fragment. These fragments of the molecules remain in the water in a peculiarly active state, in which they are said to be electrically charged, the exact meaning of which, however, is not completely understood. In this state the separate parts into which the molecules are broken up are called "ions". The hydrogen nucleus ion is described as positive and the remainder of the molecule negative.

The electrical explanation given is that a positive ion contains one electron less than is necessary for stability, and a negative ion one more electron than is necessary for stability. Thus the one contains an excess of that energy

which the other lacks, and to the same extent. If a simple acid be added to this pure water, the amount of the dissociation increases, and, if, on the other hand, an alkali be added, the dissociation decreases.

This is the simplest possible abstraction of the principle underlying coagulation. The impurities in the water such as can be removed by coagulation and filtration appear to be ionized. The same applies to some extent to any and every substance dissolved or in suspension in the water. The removable impurities may be, and generally are, considerably larger than the molecular size, and consist of groups of molecules which in an ionized condition will remain suspended in water indefinitely by reason of their mutual repulsions, and, to some extent, by that form of energy known as Brownian movements, unless some change is made by which the ionization can be neutralized or balanced in some way by the addition of the proper ingredients in which the ionization is of an opposite character. In hard waters the ionization of the impurities is negative to that of aluminium hydrate precipitated from solution as described above, and thus coagulation takes place as the neutralization proceeds.

The act of catching the impurities by the alum is the fundamental point of coagulation and must not be confounded with the precipitation which follows it, and one must guard against the assumption that the water which visibly flocs the best will produce the best results when filtered. Sometimes this is certainly not the case. Unless the impurity is caught before filtration, very little prospect remains of it being caught at all. In laboratory experiments the mixing of the solution of alum with the water can always be carried out quickly, but not so in practice, where it is quite possible to find the reactions progress far too quickly for the best results. In some very few instances, however, it has been reported that hours, or even days, may elapse before the reactions are complete. Of these the writer has had no experience, but in any event in such cases it would probably be desirable to condition the water before treatment with the alum.

The nature of coagulation being closely associated with the hydrogen ion concentration in water, it has recently been suggested that a measure of it in water might be used to determine the necessary amount of alum to be employed and otherwise control the whole purification process, and some considerable progress has been made in which Hannon² at the Toronto Filtration Plant, in collaboration with Wolman, has done most important work. Hannon has shown that the precipitation effects do vary with the hydrogen ion concentration, but that with Lake Ontario water the alkalinity is too high to reach the optimum, or isoelectric point as it is called, with a reasonable amount of alum treatment alone, but this point has been approached by the application of mineral acids to the water. This, of course, might not be permissible in practice, but the application of carbonic acid, if it can be dissolved in the water, would be more effective and practical. This, however, could easily be applied in the much-maligned pressure filters with ease by maintaining an atmosphere of the gas in the filter.

The same end can be obtained by reducing the alkalinity of the water by softening, and a third method is to drive hydrogen ions into the water by electrolysis. There is in this method of controlling the purification of the water the possibility that the most effective hydrogen ion concentration floats about with the nature of the water.

It is, however, possible that a careful study of a particular water by this method may lead to some correlation regarding it and the alum requirements. In any natural water the variation in the hydrogen ion concentration is almost invariably due more to changes in the carbonic acid content than to anything else, as may be noticed by the considerable change in it due to filtration or to the treatment with alum, which, while reducing the alkalinity, increases the carbonic acid.

In the case of Lake Ontario water at Toronto, Howard has found that the most certain index of the amount of

contamination in the water and the corresponding alum requirement is the amount of free ammonia present, but no definite scale of relationship has been established, and seasonal changes appear to have a very considerable effect; but this seasonal effect is probably due to changes in the carbonic acid content.

Coagulation with this particular water appears to proceed much more favorably and satisfactorily during the winter months than the summer months, but this cannot be attributed entirely to temperature because the analysis of the results separated into those above and below a temperature of 45 deg. F. do not show the same difference that the corresponding comparison between the summer and winter results do show, but the hydrogen ion concentration is less in summer than in winter; i.e., the water is further removed from the isoelectric point. Hannon thinks that to be due to increased temperatures but absorption of carbonic acid by microorganisms may have the more important effect, as they are certainly more numerous in summer.

Smith has shown that the treatment of a hard water with alum is greatly simplified by softening the water with lime applied slightly in excess of the amount necessary to produce the minimum hardness, and quotes the case of Little Rock, Arkansas, as a satisfactory example. It also corresponds with experiments known to the writer on the reduction of color in the Otonabee River water. It also corresponds with the laboratory experiments of Morison¹ and Pirnie³ and the hydrogen ion concentration.

Summary of Conclusions.

1. A hard water invariably contains an excess of the necessary ingredients for decomposing the alum, but a trace of some form of aluminium remains in the water after filtration in the form of an aluminate except at one critical concentration, often too far removed to be realized in practice.
2. Every substance in the water, whether dissolved or suspended, has an effect upon the amount of alum required, and generally the higher the amounts of mineral matter and the harder the water the greater will be the need of alum to coagulate the impurities.
3. The necessary amount of alum or the proper treatment before adding the alum can be determined only by experiment.
4. Gelatinous compounds in hard water seriously inhibit coagulation.
5. The time required for the reactions to take place is mostly short, approaching the instantaneous and in some cases too short for the best results unless specially rapid means of mixing are adopted. In a few rare cases the reactions extend over a period of hours or days. In such cases special treatment becomes desirable.
6. In Lake Ontario water in the absence of considerable turbidity the free ammonia content is the best index of the contamination and corresponding alum requirements.
7. The study of the hydrogen ion concentration has been suggested as an index of the amount of alum required, and some forward steps have been made by this means.
8. If the hydrogen ion concentration of a water is a measure of the condition of that water for treatment with alum, then we might expect the presence or absence of free CO₂ to have a most important effect upon the problem.
9. Filtering in pressure filters in an atmosphere of CO₂ might be expected to bring the hydrogen ion concentration up to the isoelectric point with care and certainty, but the probability of corrosive effects would be increased.
10. Softening the water with lime has much the same effect.
11. Forcing charged hydrogen ions into the water would temporarily (at least) also have the same effect.
12. When the isoelectric point is reached, there is little or no residual alum in the filtrate, and the application of the alum is efficient.
13. Filtering water always raises the hydrogen ion concentration by forcibly separating the parts of the water

molecules in compliance with the better known principles of contact electricity, but the hydrogen ion concentration slowly returns to nearly its former value if the water is allowed to remain in contact with the air.

HUDSON RIVER VEHICULAR TUNNEL

DEFINITE progress is being made in the construction of the vehicular tunnel under the Hudson River, from New York City to New Jersey. The contract was signed on March 30 and ground broken for the powerhouse on the New York side, on the following day. The tunnel is being built by a commission composed of representatives of the States of New York and New Jersey, and the contractors are Booth & Flynn Ltd.

The tunnel, which will be of twin tubes, will be approximately 1½ miles between the land shafts. It will require 10,000 tons of structural steel, 700 tons reinforcing rods, 106,000 tons cast iron tunnel lining, 10,000 tons cast steel tunnel lining, 5,000 tons bolts and rods, 172,000 barrels Portland cement, 56,000 barrels natural cement, 44,000 cubic yards sand, 80,000 cubic yards gravel and 16,000 square yards waterproofing. The total excavation is 404,000 cubic yards.

The tunnel will cost \$19,331,723.50, the States of New York and New Jersey bearing the expense of the project. Because the tunnel will be used largely by motor vehicles, the greatest care and study has been necessary to provide proper and adequate ventilation to counteract the poisonous gases from the cars. Many tests have been made in other tunnels and precautions will be taken to obviate any trouble in this respect.

The contract contains some interesting features in regard to payments. The contractor is required to give a bond of \$4,000,000 for faithful performance of the work. In addition, 10 per cent. of the partial estimate is retained until \$1,000,000 is reached, after which payments are made in full. Vouchers of payment are made up, 45 per cent. by each State, each Commission retaining 5 per cent. until the total retained amount is accumulated. When the tunnel lining has been completed and compressed air removed, one half of this retained amount, or \$500,000, will be paid the contractor, the other half being retained until the completion of the work. The contractor may withdraw this retained percentage by substituting securities which are lawful investments for savings banks in each State, and will receive interest in such securities as it accrues. Any work not provided for in the contract may be done at cost plus 15 per cent., the cost to include labor and compensation insurance, but not the use of plant, tools, or any portion of overhead expenses.

Another interesting feature is the provision for financing plant expense. The contractor will be paid \$1,200,000 for the compressors and shields, payments to be made as the plant is erected; after the final payment for plant has been made a deduction of 8 per cent. from succeeding partial payments will be made until the sum advanced for plant has been reached, this in addition to the regular 10 per cent. retention. In the event that this amount has not been reached by the time the tunnel lining is completed, the remaining balance at that time will be deducted from the following estimate. This provision certainly relieves the contractor from a big item of initial expense and saves a large sum in interest charges which would otherwise be included in the bid as a portion of the overhead.

Payment is made for material delivered at the rate of \$75 per ton of steel, \$60 for cast steel and \$35 for cast iron. Progress payments are made monthly, and interest at the rate of 6 per cent. will be paid if they are delayed more than 30 days, or the final payment more than 40 days after the certificate of completion has been filed. The contract contains a strike clause which allows an extension of time to the contractor if the work is delayed by a strike not instigated by him.

TOWN PLANNERS ELECT OFFICERS

SEVERAL excellent speeches and notably a very fine presidential address marked the annual dinner of the Town Planning Institute of Canada, at the Chateau Laurier, Ottawa, on May 12.

Some aspects of the financial side of town-planning were touched by Dr. Adam Shortt, who also outlined a method of taxation by which cities would derive benefit from land booms. The process whereby shack towns and slum areas sprang up just outside of the city limits would go on eternally if cities did not make provision for taking in sufficiently large areas while the land was still farm land. Contrary to general opinion, this did not involve the expenditure of large sums of money and land used for farming was assessed as such. James Ewing, of Montreal, in a short address said that he believed that Montreal would soon have a town-planning commission.

The most important matter before the convention, which was the third annual meeting of the Institute, was the revision of the existing constitution and bylaws, many changes being made, which will be shortly submitted to the entire membership for approval. If approved, the new constitution will form the basis upon which the Town Planning Institute of Canada intends to seek incorporation as a Dominion body.

An invitation was extended by H. L. Seymour, of Toronto, for the holding of the next convention in that city, and it was forwarded to the new executive for consideration.

There were a number of important papers read during the convention having to do with town planning, and suggested physical and social improvements applicable to this Dominion, not the least in interest being that read by Thomas Adams, past president of the institute on "Zoning." In addition, he gave the details of a comprehensive town planning scheme which is now being applied to the city of Welland, illustrating all its features with the aid of blueprints and maps.

In his address on Zoning, he described its many advantages which are applicable to all phases of municipal life; where the industrial areas are designated and with the manufacturing sites segregated from the residential and park sections, while the zones also apply to the character of buildings allowed in them and mean a reduced fire hazard.

Papers were to have been read by W. E. Hobbs, director of town planning, Manitoba, and T. D. Le May, city surveyor of Toronto, but time did not permit, and it was decided to write the addresses into the proceedings and have them published in the Journal of the Institute.

J. P. Hynes, Toronto, was elected president; James Ewing, Montreal, Noulain Cauchon, Ottawa, and W. A. Begg, Regina, vice-presidents; Major Douglas H. Nelles, Ottawa, honorary secretary-treasurer, and W. D. Cromarty, Ottawa, librarian. The council elected were: Messrs. H. L. Seymour, Toronto; H. B. Dunington-Grubb, Toronto; Prof. Percy E. Nobbs, Montreal; F. G. Todd, Montreal; Lieut.-Col. E. T. B. Gilmore, Ottawa; A. A. Dion, Ottawa; Prof. A. A. Stoughton, Winnipeg; L. O. Charlesworth, Edmonton; Prof. E. E. Buck, Vancouver, and W. F. Burditt, St. John, N.B.

McGILL ENGINEERING GRADUATION

RESULTS of graduation in the engineering faculties of McGill University, include the following: Honors in Applied Science, P. E. Biggar, Ottawa; Honors in Mechanical Engineering, E. C. Duff, Carbonear, Nfld.; B.A.Sc., degree R. O. Bales, civil engineer, Belle Isle Station, N.B.; I. W. Clarke, chemical engineering, Bear River, N.S.; R. H. Foss, mechanical engineering, Sherbrooke; W. R. McClelland, metallurgical engineering, Halifax; R. A. McGregor, mechanical engineering, New Glasgow; D. W. MacKean, civil engineering, Halifax; J. E. Taylor, chemical engineering, St. John West.

PREVENTION OF SEWAGE CONTAMINATION IN ONTARIO*

What the Provincial Board of Health is Doing to Protect the Water Works Operated by the Various Municipalities — Four Divisions of Board's Activities.

By F. A. Dallyn

Sanitary Engineer, Ontario Board of Health

SPEAKING generally, there seems to be some misapprehension as to the function of the Ontario Board of Health with reference to what the Board is doing to protect the various water works throughout the province from sewage contamination. It has been wrongly assumed by many that it is the duty of the Provincial Board to undertake the correction of conditions for which the redress lies within the power of the local authorities. It is true that there are certain general clauses in the Public Health Act which empower the Provincial Board to supervise such matters; at the same time there are, also, other clauses prohibiting the pollution of streams, the enforcement of which lies within the power of any individual or any municipality caring to prosecute the matter. So, in the legislation opportunity is afforded for individuals other than the Board to take action.

When one stops to realize the size of Ontario, the scattered nature of the urban developments and the small Government appropriations which are available in any one Department, it is not to be wondered that the Provincial Board is loath to assume the task of minding the business of the municipalities.

The task of the Board must necessarily be that of supervision. The exercise of this function has brought some splendid results during the past ten years. In 1910 the typhoid death rate in cities was 51.5 per 100,000, and in 1919 it had been reduced to 4.3. In 1920 it was 5.5. This reduction has been gradual, as in shown in Table 1.

TABLE 1—TYPHOID RATE PER 100,000 POPULATION.

	1920	1919	1918	1917	1916	1915	1914	1913	1912	1911	1910	1909	1908
Counties	6.2	4.61	5.10	6.6	8.1	9.4	10.0	13.3	10.9	16.1	22.0	25.1	20.5
Cities	5.5	4.3	9.6	7.5	12.1	9.4	12.4	17.3	27.7	35.8	51.5	34.3	37.8
Towns	25.0	19.5	17.2	31.4	52.2	38.0	47.4	46.0	47.0	62.3	56.4	67.7	107.1
Averages for Province	7.0	5.2	7.51	8.4	12.5	10.7	13.5	16.7	18.7	25.3	31.5	29.9	29.7

While the Board has always been active in controlling typhoid outbreaks, the first systematic effort to control provincial rates seems to have arisen simultaneously with the work reported upon in the "Progress Report" of the International Joint Commission on the pollution of boundary waters. The statistics which were prepared in connection with that report, in which, by the way, the Provincial Board had a large share, definitely showed that certain cities along our Great Lakes exhibited typhoid rates very much in excess of the provincial average. Investigations that were undertaken in connection with the water supplies showed clearly that the supplies were in an unsatisfactory condition.

The Board, in coping with the local situations on this side of the boundary, took advantage of the fact that chlorination of water supplies was being advertised as a cure-all, and every municipality showing a rate higher than the provincial average was persuaded, or forced if necessary, to install chlorination apparatus, which was supervised for a period. The results of these experiments demonstrated to the Board's satisfaction that certain of these cities on the Great Lakes had been and were acting as distributing points for typhoid fever. The improvement of the local situations, accompanying the administration of chlorine to the water supply, not only had an effect on the municipalities directly concerned, but the effect was also felt all over the province.

That this should be so may readily be conceded because of the fact that even though certain situations are

potentially dangerous, they will not yield typhoid fever until the organism is introduced from the discharges of people suffering from, or carrying, the disease. If the number of cases of the disease are diminished in the province, naturally there is a falling off in the number of coincidences whereby pollution might be introduced for water supplies not so protected.

Table 1 shows, therefore, not only a definite reduction in the typhoid rate of the cities, but it also definitely shows a general reduction in the provincial rate. The typhoid that we have now remaining with us seems to be more or less confined to the smaller towns, and to arise from wells and the occasional contamination of the milk supplies. Many of the persons recovering from typhoid fever continue to harbour the organism in the body waste for a number of years after recovery from the attack.

It is possible, then, to conceive of towns in which the prevalence of disease at one time or another has given rise to a considerable number of carriers, who in turn pollute the wells. There is a remarkable freedom, I am glad to say, from typhoid fever in towns which rely solely upon the municipal water supply.

Supervisory Function of Board.

The supervisory function, therefore, of the Board is mainly concerned in detecting and correcting conditions in centres which show rates that are unduly high. The Board is fortunate in that the Department of the Registrar-General is co-ordinated with that of the Board of Health.

Returning again to the question of just what is the duty of the Board: Granting that it had all the money that would be required, there arises the question, to what extent will the citizens tolerate the exercise of arbitrary power in matters upon which their information is lacking? What I mean to say is: Suppose the Board, vested as it is with extraordinary power, should proceed to exercise this power considerably in advance of local information and

local education (which is possibly another matter). The result would be—and it can be perceived every year when the House meets—that there is definite resentment of the authority vested in the Board. If this resentment were Province-wide instead of being confined to a few municipalities or a few individuals touched by the Board's activities, I have no hesitation in saying that there would be an effort, and possibly a successful one, to modify the Health Act radically, and to take from the Board the authority which has made possible the progress noted during the last ten years.

It must, therefore, be accepted that despite the authority vested in the Board, the exercise of that authority is limited because laws may be amended almost as readily as they are enacted.

It has been found necessary, where the Board wishes to impose arbitrary judgment upon a municipality, not only to inform itself of the facts, but also to give considerable publicity to the matter, in order that the citizens should have an opportunity of digesting the Board's conclusions and to re-adjust themselves to those conclusions, the evidence supporting which is not always as obvious as when one has an epidemic condition of disease.

Educational Campaigns

It must also be recognized that in these educational campaigns the Board is not only dealing with facts, but has to convince the citizens of its interpretation of the facts, and at the same time to persuade them to loosen the strings of their pocket-books, a matter requiring considerable diplomacy in itself. This latter phase of the matter of the pocket-book opens up a further question, and that question is, which work should take precedence,

*Paper read before the Canadian Section, American Water Works Association, Brantford, Ont., May 13, 1922.

and in this connection I think it is encouraging to note that the municipalities are spending large sums on the improvement of road surfaces, the extension of sidewalks and works of this nature. So it does not seem that a lack of funds is perhaps the paramount difficulty when one comes to discuss the question of the treatment of water supplies and of sewage disposal.

Over against the question of policy and precedence, there is perhaps a more important question, and that is of utility. Personally, as between water purification and sewage disposal, I have always been a firm believer in the treatment of sewage for further protection of the water works plants. At the same time, I cannot ignore arguments to the effect that sewage treatment as generally carried out and nominally supervised, does not afford the protection that the popular mind conceives to be the case.

The situation in Ontario is somewhat aggravated by the fact that our rivers and streams are in general fast-flowing, and as a result afford but little storage between the point of entrance and the point of withdrawal. This fact changes the whole complexion of the problem of protecting our water supplies. The storage of water has been relied on in the Old World for protection for a number of years. The work of Sir Alex. Houston of some fifteen years ago amply demonstrated wherein this protection lay, and he was able to show conclusively that the majority of the pathogenic organisms introduced through a water supply rarely lived longer than two weeks under ordinary storage conditions, and that a period of three weeks was almost absolute protection. Such storage as this is not to the writer's knowledge associated with any of the local situations confronting the municipalities in Ontario, so if reliance is to be placed upon sewage-treatment works, the works in themselves must render the effluent innocuous, and that involves intensive purification and sterilization, and no matter how practical these measures may be, there is no question but that they are expensive and that it is hardly within the province of the Provincial Board of Health to force an issue along such lines at this stage of the game.

Without wishing to dodge responsibility, I think, I can fairly say that in no instance has the Provincial Board initiated proceedings against a municipality for sewage treatment, behind which was not an order or ruling of the courts, or an agreement arising out of an action initiated from sources other than the personnel of the Board.

Standards Required For Effluents.

I presume that some engineers will not be satisfied unless I touch for a moment on the question of the standards required for the effluent from a sewage-disposal works. That some statement should be made is particularly pertinent in the minds of many, because of the fact that legislation leaves the matter clearly in the hands of the Board to determine.

It is very difficult to supply a satisfactory answer to such inquiries. An answer has been attempted in England, largely determined from the conclusions of the Royal Commission on Sewage Disposal, but the situation in England is radically different from that in Ontario. The streams are smaller; the uses to which the streams are put much more varied, and the intensity of pollution is very much greater in the Old World than in this. And while it may be conceded that some minimum standard might well be voiced by the Department, it appears impossible without hardship to set a standard which should apply Province-wide.

The situation is very complicated, especially in view of the fact that most of our greater water courses are international in character, and the pollution found therein, as has been concluded by the International Joint Commission, frequently rises on one side of the boundary to the injury of the health and property of the other. It would be a hardship, indeed, to impose sewage treatment on the Canadian municipalities along, for instance, the Detroit River, without similar restrictions being imposed upon the city of Detroit. Such a situation also holds true with reference

to the pollution existing in the lower Niagara River and the city of Buffalo.

For the more inland towns, local situations have largely governed the quality of the effluent demanded. Few of our streams are so small but that they can satisfactorily oxidize effluents which have been treated by any of the well-known biological processes. It is about bacterial pollution that the Board and riparian owners have chiefly concerned themselves of late.

The Board hesitates to support any active campaign for the chlorination of sewage effluents, for the reason that it is an extremely expensive undertaking and subject to interruptions which nullify very largely the benefits hoped for. The processes, therefore, which combine clarification, oxidation and sterilization are of particular interest to the Board.

It has been asserted that the Board is particularly biased with reference to the merits of the activated sludge system. I take issue with that conclusion. I admit that the Board and its engineers are thoroughly familiar with the process, having experimented with it continuously since 1914, and that they are exceptionally aware of its advantages and limitations. But the Board has also carried out intensive experimental work on the various types of distributing filters, both on an experimental scale and in connection with the numerous institutions operated by the Province, and I may say that this information is as complete as that with respect to activated sludge. The Board is also familiar with Imhoff tanks. At the Experimental Station we had in operation one of the first Imhoff tanks on this continent, in 1912, the results from the operation of which are similar to those obtained elsewhere.

The engineering department of the Board being, I hope, thoroughly informed of the various processes of sewage treatment, has been loth to recommend any particular type, except upon financial grounds or because of some special requirement of a local situation, determined either from the facts or from a court decision.

Of late the Board has taken the position that the consulting engineer or the municipal engineer in recommending a sewage disposal plant for a municipality shall state the estimated capital cost and also the annual operating charges of the system. Occasionally the Board has also required that a similar set of figures be computed for another type of plant when they are not furnished in the original report. If in the judgment of the Board the operating costs of the two systems, including the interest and the annual charges for retirement, are approximately the same, the Board naturally would favor that system which would yield the most satisfactory effluent. This attitude on the part of the Board is, I believe, the correct one, and I think many will admit that the Board is pre-eminently in a position to determine or advise as to which plant would yield the most satisfactory effluent, taking all factors into consideration.

Again the question may be asked, what is the Provincial Board of Health doing? If the Board has not taken the initiative in the matter of forcing the municipalities to undertake works for sewerage treatment, it has on the other hand assisted materially in simplifying the legislation whereby a municipality suffering a hardship may take action on its own behalf, and the Public Health Act recites clearly the extent to which the Board will assist or can be asked to assist in respect to such actions.

Laboratory Service.

In addition to the chief laboratory in Toronto, the Board now has branch laboratories in London (at the Institute of Public Health), Owen Sound (under George Murray Fraser), Peterborough (under A. Y. McNair), Kingston (under James Miller), Fort William (under N. O. Thomas), North Bay (under John S. Douglas), and Sault Ste. Marie (under N. F. W. Graham).

Besides these, there is also a laboratory at the Experimental Station of the Provincial Board in connection with the investigation of sewage and water. This is under the direction of the Sanitary Engineering Division.

Any of these laboratories are equipped and prepared to do water analysis and to determine definitely whether a given sample shows an alarming amount of pollution or not. This in itself is a considerable gain, in that it determines whether sanitary surveys are necessary to round up a source of undetected pollution.

TABLE 2—SUMMARY OF APPLICATIONS FOR APPROVAL OF DEBENTURE ISSUES IN CONNECTION WITH WATER AND SEWAGE APPROVED BY THE BOARD, 1915-21.

	Applications	Estimated Cost
1915	286	\$4,679,496.74
1916	190	2,010,079.42
1917	186	2,880,534.72
1918	146	1,590,658.39
1919	256	5,508,698.53
1920	262	7,359,659.50
1921	367	7,305,195.09

As well as a laboratory service the Board has been conducting sanitary surveys of the municipalities during the past three years and collecting information with respect to the extent to which public utilities such as water works and sewerage are being used, locating premises unconnected to sewers, and determining the number of closets and wells (private and otherwise.)

All of the information contained in the sanitary surveys is of particular interest in that they reveal conditions which may offer some partial explanation of why typhoid continues to exist in some municipality despite improved water supplies.

When this work was undertaken some three years ago, I anticipated finding conditions, which were not altogether satisfactory, but at the same time, I had no idea that so many premises were unconnected by either water works or sewerage in many of our larger towns.

The correction of the conditions revealed by surveys of this type naturally rests with the municipal authorities and with the local Boards of Health. It does not appear that the function of correcting these conditions should devolve upon the Provincial Board of Health, since it must be perfectly obvious that should the Board give its attention to details of this type, there would be no opportunity for covering those general fields of endeavor which in no sense fall within the province of the municipalities.

Research Work.

I shall conclude my argument as to what the Provincial Board is doing to protect the various water works throughout the Province from sewage contamination by stating that the Board has consistently, since the establishment of the Experimental Station, carried on research with respect to matter pertinent to the question, under discussion. Following is a rather incomplete list of some of the work which has been published.

"Factors in the Design, Regulation and Action of Slow Sand Filters," by F. A. Dallyn, April, 1913.

"Report upon the Purification of Sewage," by A. V. DeLaporte, 1913.

"Studies in the Behavior of Mechanical Filters," by C. S. Robertson, 1913.

"Studies in the Disinfection of Sewage by Calcium Hypochlorite," by C. R. Avery, 1913.

"A Comparison Between Bleach and Liquid Chlorine," by C. R. Avery, 1914.

"Does Alum Inhibit the Action of Chlorine as a Disinfectant," by C. R. Avery and O. G. Lye, 1914.

"Ultra Violet Ray Sterilization of Water," by F. N. Parkinson, 1914.

"Some Experiments in the Solubility of Alum," by Miss G. E. Gallinger, 1916.

"Report upon Filter Alum Used in Ontario," by Miss G. E. Gallinger, A. V. DeLaporte, and F. A. Dallyn, 1916.

"Desirable Features for Alum Feed Apparatus in Water Purification Plants," by F. A. Dallyn, 1916.

"Compilation of Recommended Methods of Physical and Chemical Examination of Water and Sewage," by A. V.

DeLaporte, 1918. (Revision in 1920, including interpretation of water analysis).

"Effect of Periods of Non-Aeration in the Activated Sludge Process of Sewage Purification," by G. A. H. Burn, 1921.

Practically all of these experiments deal with some particular problem which either has or is now confronting the Municipalities in connection with the operation of their water and sewerage plants.

Research not only makes available a certain amount of information for the public and the municipalities in general, but it has afforded the engineers of the Board an opportunity of obtaining first-hand information on many of the problems with which they are confronted. It gives, too, the Board an opportunity to train its men properly. The laboratory is recognized by the University, so students may proceed to their Master's degree from work carried on at the Experimental Station during the University year.

At the Experimental Station we are capable of carrying on experiments with respect to any type of water-purification equipment, and are completely equipped to carry on research in many forms of sewerage treatment. Not only do we obtain information as to the results from the various methods when they are working satisfactorily, but we obtain as well definite data as to results when the plant is operating badly. In addition, we get some sense of proportion as to what could be reasonably expected of plants of this type in view of the many factors entering into their design and the conditions under which they must operate.

And it is from information gleaned from such sources that the Board's action with respect to any particular situation is determined.

In summing up I would suggest that the Provincial Board is doing all that its present appropriations and the state of public opinion will permit it to do in connection with the protection of water works from sewage contamination, and that the contribution of the Government to this matter is roughly divided under the four headings that I have dwelt upon at some length, namely, supervision, legislation, laboratory service and research.

LARGE EXPENDITURES ON CANALS.

SINCE the beginning of construction a total of \$29,399,405.93 has been expended on the Welland Canal and \$30,787,977.90 on the new Welland Ship Canal. In the fiscal years from 1913 to 1922, inclusive, and ending on March 31 in each case, the following sums were spent: 1913, \$305,571.34; 1914, \$1,071,733.68; 1915, \$4,147,553.84; 1916, \$4,978,030.64; 1917, \$3,532,546.21; 1918, \$1,262,136.94; 1919, \$1,868,239.01; 1920, \$3,631,289.31; 1921, \$5,192,629.41; 1922, \$5,693,590.97; total, \$31,583,291.85. Of this sum \$203,005.60 was on construction on account of the present Welland Canal, and \$719,509.50 on improvement account. The balance of \$30,660,776.75 was on construction of the new Welland Ship Canal.

On the Trent Canal since the beginning of work on that waterway a total of \$20,702,514.80 was expended, of which \$18,849,361.11 was on construction account and \$1,853,153.69 for improvements. For the fiscal years ending March 31, from 1911 to 1922, inclusive, the following sums were expended: 1911, \$1,744,942.25; 1912, \$1,820,590.32; 1913, \$1,204,105.73; 1914, \$1,177,596.67; 1915, \$1,058,566.35; 1916, \$1,027,519.03; 1917, \$624,441.78; 1918, \$613,980.85; 1919, \$412,507.25; 1920, \$1,077,251.36; 1921, \$690,197.13; 1922, \$673,261.15; total, \$12,124,959.87. Of the latter sum \$10,889,063.51 was on construction account and \$1,235,096.36 on improvements.

Ontario has 27,117 miles of surfaced roads, made up as follows: Gravel roads, 23,166 miles; broken stone roads, (Macadam) 3,385 miles; broken stone roads with tar carpet coat, 266 miles; bituminous penetration pavement, 139 miles; asphaltic concrete pavement, 43 miles; cement concrete pavement, 118 miles.

PUMPING PLANTS FOR LAND DRAINAGE*

Reclaiming Land in Mississippi River Valley — Electrically Driven Centrifugal Pumps Often Used for Drainage Work — Advantage of Diesel Engines.

By L. C. Craig

Ast. Engineer, E. T. Perkins Engineering Co., Chicago

MANY acres of swamp and overflowed lands in the United States are so situated that they cannot be entirely reclaimed without pumping. This is especially true of the 20,000,000 or more acres in the Mississippi River Valley. During the last 25 years many drainage districts have been formed in the Mississippi River Valley, the first areas to be reclaimed being those so situated that all or a part of the drainage water would flow off by gravity. Gradually as the land increased in value pumping plants began to be installed more and more, as a part of the drainage systems. There exist today many areas with no drainage and others where only partial gravity drainage is obtained, where eventually pumping plants will be installed.

Only a few years ago \$20 to \$30 an acre was considered a big price to pay for the draining of agricultural land. Today, because of increased land value, many areas are being reclaimed at a cost of \$60 and more an acre.

Unfortunately, there exist today few reliable records concerning the capacity and efficiency of drainage pumping plants; such records, where found, usually extend back over a period of only a few years.

Many plants have been installed without adequate means being provided for making tests, or those in authority have failed to realize the necessity of such tests. In many cases no engineer is employed after the construction period.

Those matters are gradually being remedied and during the next few years we will see a very marked development of drainage pumping in this country.

A drainage area requiring pumping is usually one with the ground level, so low as to require the raising of the drainage waters over a dam or embankment to a higher level. This dam or embankment may be part of a levee system, constructed to protect lands from flood overflow, as is the case in most river bottom areas, or a dam and pumping plant may be placed in an ordinary drainage ditch at a point where, because of a very flat gradient or lack of outlet, it is found impossible to take care of the drainage waters by ordinary ditch construction.

Conditions Affecting Size of Plant.

The size of pumping plant required for any particular drainage area depends upon a number of varying conditions, among which are:

1. The size and topography of the drainage area.
2. The amount and distribution of rainfall.
3. The system of ditches and drains used, and the amount of storage capacity available in ditches and reservoirs.
4. The nature of the soil and sub-soil as affecting run-off and seepage.
5. The method of operation of the plant and the degree of drainage required.

The first three factors given above are, of course, the most important in the design of any drainage pumping plant, but all should receive consideration.

For the past 20 years, or more, in Central Illinois and along the Mississippi River pumping plants for removing water from flat drainage areas have been designed for a maximum pumping capacity sufficient to remove in 24 hours $\frac{1}{4}$ in. in depth of water over the entire area. In Holland and other European countries for a much longer period $\frac{1}{4}$ in. or a little more has been used as the maximum capacity for drainage pumping plants. Experience in recent years has not shown that the run-off coefficient of $\frac{1}{4}$ in. should be changed as a standard basis of design under

average conditions. But the engineer must be sure to give due consideration to all modifying conditions in each particular case.

All other conditions being equal, the small drainage area of only 1,000 or 2,000 acres will require a slightly larger pumping plant in proportion to its size than an area several times as large. Where some of the area is higher with steep slopes and impervious soil, the run off coefficient for this portion must be made greater; in some cases it will be twice as great.

The amount of rainfall in Central Illinois averages about 35 ins. per year. Of this amount measurements have shown that about 26 to 30 per cent appears as run-off. Rains of 2 to 3 ins. in 36 to 48 hours sometimes occur.

In many drainage areas considerable storage exists in lakes and sloughs which it may not be found desirable to drain. This storage capacity, in addition to the storage ordinarily afforded by the drainage ditches, will reduce the size of the required pumping plant. If there exists considerable areas of tiled land, additional storage will be afforded.

Influence of Soil and Sub-Soil.

The nature of the soil and sub-soil of the drainage area has a big effect on the run-off, and when the water on the outside of the levee the effect may be the opposite, and the high stage, on the amount of seepage. If the soil is a close, compact formation, the surface run-off will be heavier from a sudden rain. A sandy sub-soil underlying a drainage area is generally an advantage, because the necessity of constructing tile drains and many small lateral drainage ditches may be largely eliminated, but during high water on the outside of the levee the effect may be the opposite, and the amount of pumping increased by an excessive amount of seepage.

Levees exceeding 10 ft. in height are usually constructed with a muck ditch or small ditch excavation 4 to 8 ft. in depth, constructed under the base before the levee is built, so as to bind in and help consolidate the levee fill with the soil formation underlying the base, and levees, when so built, have been found to resist seepage in a marked degree. However even with a well-built levee and a sand or gravel sub-soil there will be considerable amount of seepage which rises to the surface of the ground inside the levee or may be intercepted by tile drain or surface ditches. Where such tile drain or surface ditches exist, located parallel to and adjacent to a levee so as to cut off and carry away the seepage, the amount of such seepage waters may be as much as 2 second feet per mile of levee.

A pumping plant should be designed to operate continuously if necessary. Generally, during the winter months little pumping will be necessary, because without growing crops little drainage will be needed, but it will be found to be an advantage to pump occasionally throughout the winter so as to reduce the ground water level and thereby secure an early drying of the soil in the spring. In this manner the run-off from heavy rain coming in the spring will be lessened and the size of the pumping plant which might otherwise be required may be reduced.

Type of Plant To Use.

After the amount of water to be provided for in the capacity of the plant has been decided on, we must next determine the type of engine and pump which should be used.

The importance of a well designed pumping plant cannot be overestimated. Many pumping plants have been installed in drainage districts along the Mississippi and Illinois Rivers which have been operating with very poor economy, because of poor design. In some cases both pumps and engines have been removed and others installed once or more in a period of 10 or 15 years.

A well designed pumping plant does not mean necessarily one having the greatest economy of operation. Usually from 60 to 80 per cent of all pumping is done in the four months March, April, May and June and during the late summer and fall months and in some localities no pumping at all is needed. It can readily be seen, therefore, that with the plant idle a good share of the time it might not

*Paper read at the National Drainage Congress, St. Paul, Minn.

be economical to spend a lot of money on costly equipment in order to secure economy of operation.

As a usual thing, in a well designed pumping plant using steam, the operating expenses are about half of the total cost including fixed charges. Where the operating expenses are much less than half of the total cost it will usually be found that the total cost should be reduced by using less costly equipment. The item of fixed charges, including interest, taxes, insurance and depreciation, should always be given full consideration in arriving at the total costs as in any other well designed plant installation.

As pumping plants must be depended upon to operate when needed and any delay may mean a flooding of large areas with resulting loss of crops, reliability is one of the chief factors governing design. Or, as a usual thing, it may be said that a type of pumping plant which has proved itself reliable and will require the least annual cost, including fixed charges, will be the best.

Types of Pumps Used.

Several kinds of pumps, including scoop wheels for low lifts, rotary, plunger and centrifugal pumps, are used in drainage pumping but the centrifugal pump has come to be recognized as best suited to conditions usually found in drainage work.

The number and size of the units to be used will, of course, depend upon the capacity and the conditions of operation. In order to have at least one pump in reserve in case of breakdown it is desirable to have at least 2 units, and one of these units should have about twice the capacity of the other, for the reason that the small unit will operate over longer periods with greater economy. This is especially desirable where steam is used as the source of power, as the frequent starting and stopping and firing up of boilers will necessitate the burning of much additional fuel, and shorten the life of the boilers. Where three or more units are used they should be of equal size. The total capacity of the pumps should be sufficient to pump the maximum quantity of water against a static head about 3 or 4 feet below the maximum expected.

Friction Head In Pipes.

In order to determine the actual or hydraulic head on the pump, we must add to the static head an amount which should not exceed 3 ft. in a well designed pumping plant. This additional head, called the friction head, is due to the friction in suction and discharge pipes, the velocity head and the losses at the entrance and outlet of these pipes.

In many poorly designed plants not enough attention has been paid to eliminating the losses in the suction and discharge pipes. The entrance to the suction pipe should be expanded so as to reduce the velocity to not more than 3 ft. per second; 2 ft. per second is better.

The centrifugal pump operates efficiently only when running at or near the speed which is suitable for reach particular head. Therefore, where the total head is variable, as in most drainage pumping, it is desirable to have some method of regulating the speed. This is accomplished in the case of the steam engine by regulating the speed of the engine and in the case of the constant speed induction motor by belt connecting to the pump and using two or more sets of pulleys, so as to secure the desirable speed. This latter method is cumbersome and undesirable and there is the further objection of loss of power with the belt drive.

With a pump properly designed it may be found that the source of power can be direct connected to the pump and any loss in efficiency in the pump due to the operation at constant speed will be offset by the elimination of the power loss with the belt drive. With variable speed drive or with the steam engine or internal combustion engine direct connected, it may be found that there will be losses in the engine itself, due to operation at less or more than rated speed, which will make changes of speed inadvisable. It is necessary, therefore, that the engineer, before designing a pumping plant, should make a thorough study of all data concerning the equipment he proposes to use, and if pos-

sible he should examine other plants where reliable tests have been made.

Pump manufacturers will usually furnish characteristic curves showing capacity brake horse power and guaranteed efficiency at various speeds. Curves should be drawn or computations made showing complete operating conditions, including the total quantity of water and the total number of horse power hours for various heads over a typical operating period of one year. These curves or computations should be compared with the characteristic curves of the pump to see that the pump has sufficient capacity and is so designed as to have a good efficiency while pumping the greatest quantity of water. From these data also the maximum horse power of the prime mover and amount and distribution of the fuel consumption can readily be determined.

In the case of variable speed drive a proposed operating chart should be made up, showing the proper speed and other operating conditions which should be used to secure greatest economy. The chart, of course, will be modified as found necessary by tests of the plant after construction.

Prime Movers For Pumping.

Steam engines, electric motors and internal combustion engines are all used as prime movers for drainage pumping. Which should be used, in any locality, depends upon the size of the plant its method of operation the cost of fuel delivered and the availability of competent labor.

In locations where soft coal can be obtained cheaply, steam may be an economical source of power. In large units one of the advantages of the use of steam is that better speed regulation of the pumps can be obtained. A disadvantage, of course, is the intermittent operation of the plant previously mentioned, and difficulty in delivering coal and supplies. In plants of over 200 h.p. it will usually pay to put in high speed automatic condensing engines with water tube boilers. Higher grade engines, such as the so-called "uniflow engine" with superheat, usually are found suitable only for plants of over 300 h.p. where the cost of operation is a much larger portion of the total cost than in a small plant.

Electric Pumps Preferred.

The electric drive has many advantages over other sources of power wherever electric current can be supplied at a reasonable rate. The two principal advantages are low first cost and convenience of operation. Usually the cost of an electric drive pumping plant will be about 60 per cent of the cost of a steam plant. Its depreciation is much less than any other form of plant. It can be operated with ordinary labor with few repairs, and in small plants its operation can be made automatic. The tendency during the last few years has been toward electric pumping.

Because of the low cost of fuel oil the internal combustion engine of the Diesel or semi-Diesel type is now receiving a great deal of attention as a source of power for drainage pumping plants. Up to about five or six years ago there were not over 6 concerns in this country building engines of the Diesel or semi-Diesel types. Now there are at least 16 builders of Diesel engines and at last 30 or more firms building various types of semi-Diesel or low compression engines.

Many of the types of internal combustion engines now being placed on the market are still in a state of development or have but recently passed that stage; therefore, before selecting this type of engine for a drainage pumping plant, the engineer should make a thorough investigation of the performance of engines which have been in operation at least two years.

Full Diesel Engines.

The full Diesel is an engine using high compression and high temperatures with complicated valve mechanism; needing an intelligent, skilled operator. Its first cost is also very high, and although very economical in fuel consumption, its use for drainage pumping is practically limited to large plants.

The semi-Diesel or low compression engine offers better possibilities I believe, for the small plant. This engine will develop a brake horse power hour on about 0.7 pint of fuel

oil as compared with about 0.5 pint for the Diesel engine. At present prices, oil of the grade required for these engines can be delivered in most any locality at a cost of from 3 to 4 cts. per gallon. The first cost of these engines at the present time is about \$50 to \$60 per horse power, about half the cost of the Diesel engine in small units.

There are various grades of oil used in engines of this type, varying from a gravity test of 20 to 44 deg. Baume. The trade name, fuel oil, is applied to all oil residue left after distillation has removed the gasoline, kerosene and light distillates from crude oil and varies in gravity from 20 to 32 deg. Baume. As oil varies in price, the lighter oils costing more, it is very important to be sure that the engine will run successfully on a low grade oil. Some manufacturers will guarantee operation on oil of a gravity of 24 deg. Baume; others will specify a higher grade. In some cases where the low grade oil is specified, there will be a very low content of sulphur or coke required or some other qualification which may raise the cost of the oil.

The writer recently had occasion to investigate the quality of fuel oil being used by a number of operators of semi-Diesel engines near Chicago, and found that none of them were using the low grade guaranteed by the manufacturers. The cost of the oil being used exceeded the cost of the low grade oil by from $\frac{1}{2}$ ct. to 2 cts. per gallon.

To be of use in a drainage pumping plant the engine must operate successfully at varying loads, and the regulation of fuel and water supply must be entirely automatic. Some semi-Diesel engines have trouble with their fuel and water regulation under varying loads and this is a matter that requires careful investigation.

With the increasing consumption of gasoline, it is fair to assume that there will always be a good supply of fuel oil and that the cost of this oil will always be low enough so that except in a few localities oil can be used successfully in a well designed engine in competition with coal or electricity. Many central stations are now using Diesel engines and producing electric current at a cost, including all fixed charges, of 2 to 2 $\frac{1}{2}$ cts. per kilowatt hour.

In conclusion, with reference to the use of the Diesel or semi-Diesel engine for drainage pumping plants, I will say that the development of this form of prime mover for stationary engines has not yet reached a stage where their use can be recommended without very careful investigation of plants now in operation, but I recommend that every engineer, before designing a pumping plant, investigate carefully the possibilities of this type of prime mover.

TIDAL RESEARCH WORK IN EASTERN CANADA

PEOPLE as a general rule are unacquainted with the method of obtaining information concerning tides. The system of reducing tidal observations is complicated and technical. The usefulness of the survey can, therefore, best be judged from the published results as shown in the annual tide tables issued by the Naval Department. These tide tables give the time of the rise and fall of the tide or the turn of the currents along the Canadian coasts for periods of one year in advance; that is, the time of the tides for 1922 may be obtained from the tide tables issued in the fall of 1921. The tide tables also give for various regions the height of the tide and the depth over certain areas at high and low water. The information is valuable to shipping interests as they are enabled to know the depth of water over bars and shoals at the entrances of our harbors at any stated period. The information compiled by this survey is also useful with regard to mean sea level which is determined by them and which is used by land surveyors as the basis of their levelling operations.

The record of tides is obtained by use of an ingenious instrument actuated by clockwork. This instrument gives a continuous curve which shows the height of the tide at every moment throughout the day and night, and thus records more accurate information than could be obtained by three men set to observe the tide in eight-hour shifts during the 24 hours of each day. These instruments, to

give correct results, must be carefully installed and must also be kept accurately set.

The tidal records compiled by the Canadian Government have now reached a high standard of perfection and Canada is well in the lead in recognizing the importance of tidal information not only for navigation purposes but also as a basis for carrying out levelling operations and survey work on land.

Extensive tidal research work has been carried on by the Tidal Survey Branch of the Naval Department during the past summer. This work was performed in order to obtain additional tidal data over that compiled in previous years for our harbors and various other areas for which tidal information is required.

During the past year observations of the tide were made at Campbellton and Dalhousie at the head of Chaleurs Bay and other harbors in eastern New Brunswick, where the tide is of special importance because of bars at their entrances. At these harbors, considerable dredging has been done, or is in prospect. Tidal data are essential in relation to low-water levels and the amount of rise of tide where the depth of water available for navigation is limited. The tidal data will facilitate the determination of what amount of dredging is necessary.

Three new tidal stations were put in operation at the entrance to the St. Lawrence, i.e., at Gaspé, Fox River and Seven Islands. Tidal data were also obtained for the east coast of Hudson Bay and for James Bay. In addition to the special work undertaken, the six permanent tide stations on the East Coast have been continued and from the reduction of the records obtained will be compiled tide tables for future years.

BRITISH FIRM EXTENDS HYDRO-ELECTRIC DEPT.

IN May, 1920, Sir W. G. Armstrong, Whitworth & Co., Ltd., initiated a hydro-electric section as a part of their civil engineering department, to secure orders for water turbines to be manufactured at their Elswick Works to the designs of a well known Norwegian firm.

The volume of business laid before the hydro-electric section, since it was first established was such as to cause the Board to decide to form a separate hydro-electric department, as a unit apart from the civil engineering department, as from January 1, 1922. The new department, like the old hydro-electric section, is dealing with complete water power development schemes throughout all the various stages, no less than with the various component parts of such schemes, civil engineering, mechanical and electrical.

Messrs. Armstrong, Whitworth & Co. now have survey parties out in many parts of the world looking into projects which have been brought before them for submission to the powerful financial group with whom they are working in the city of London, and it can only be anticipated that the part they will play in the coming era of intensive hydro-electric development in the Empire will be a very important one, and not only in the Empire but in all parts of the world.

The offices of the hydro-electric department are at 8, Great George Street, Westminster, London, S.W.1, and the department is under the management of Douglas Spencer, who is assisted by such well known hydro-electric engineers as Robert P. Tod, V. Bataillard and a large staff of British engineers.

An agreement has been reached between the reorganized Nipigon Fibre, Pulp and Paper Co. of Fort William, Ont., and the Ontario Hydro-Electric Commission by which that concern is to take 10,000 h.p. at a price of \$18. The contract, it is announced, will be signed as soon as a bond, provided for in the agreement, is put up by the company. The concern is to increase its capacity from 35 to 100 tons a day. As the power purchasers agree to take a certain proportion of the energy by July 1, immediate commencement will have to be made on operations to enlarge the company's plant.

AMERICAN WATER WORKS ASSOCIATION

Annual Convention Held in Philadelphia — Representative Exhibition of Materials — Detroit Next Year.

MORE than 1,000 members and guests registered at the 42nd annual convention of the American Water Works Association, held May 15 to 19 at the Bellevue-Stratford Hotel, Philadelphia, Pa. Among the Canadians present were the following:

W. S. CRAMER
President, American Water Works Association

W. H. Randall, Toronto; R. L. Dobbin, Peterboro; J. J. Salmond, Toronto; C. W. Schiedel, Waterloo; Geo. Geddes, St. Thomas; Marcel Pequegnat, Kitchener; Charles Warder, Niagara Falls; A. Collins, Niagara Falls; Alex. Milne, St. Catharines; N. M. R. Wilson, Brantford; F. W. Frank, Brantford; Thos. R. Logan, Brantford; Norman J. Howard, Toronto; C. D. Brown, Walkerville; D. McLean Hanna, Windsor; Thos. Hodgkinson, London; A. M. Bowman, Elmira; J. K. Van Gorder, Toronto; W. C. Miller, St. Thomas; A. F. McLachlin, St.

Thomas; John Hainsworth, Kitchener; W. H. Bradburn, Peterborough; B. R. McKenzie, Windsor; W. Gesses, St. Thomas; A. Collins, Niagara Falls; A. T. McLachlin, St. Thomas; and Prof. Peter Gillespie, Toronto.

Canadians Hold Luncheon.

Thirty-eight Canadian delegates and friends held a luncheon in the Blue Room of the Bellevue-Stratford Hotel on Thursday, May 18, and heard addresses by President Cramer and Secretary Diven of the American Water Works Association. The Canadian members then went into conference and in an informal way discussed matters affecting the Canadian Section, with special reference to the holding of the annual meeting next year in Windsor, Ont., and the advisability of holding a winter meeting in Toronto some time in February. The discussion brought out expressions of opinion as to how the Canadian Section can render the greatest service to water works operators throughout the Dominion.

Gracefully withdrawing from the race for next year's convention, San Francisco narrowed the choice in the executive committee to Omaha and Detroit, the latter then winning easily on the floor of the convention.

Nominations and Elections.

The following members were elected as the nominating committee: Beckman C. Little, chairman ex-officio; James J. Salmond, Toronto, representing District No. 1; J. H. Caldwell, Troy, District No. 2; W. R. Edwards, Paterson, N. J., District 3; Dow R. Gwinn, Terre Haute, Ind., District 4; John Chambers, Louisville, District 5; J. J. Hinman, Jr., Iowa City, District 6. The slate elected by this committee was endorsed on the floor of the convention without competition or even rumor of a second ticket, and the complimentary vote received by the new officers was high considering that it was only a formality.

W. S. Cramer, chief engineer of the Louisville Water Works, will be the president for 1922-3; George W. Fuller,

a well-known consulting engineer of New York City, will be vice-president; William W. Brush, treasurer; Geo. W. Batchelder, trustee from District No. 1; Joseph W. Ellms, trustee from District No. 4. Re-elected trustees are H. F. Huy, R. J. Harding, G. C. Gensheimer and J. Chris Jensen.

At a meeting of the American Water Works Manufacturers' Association, the following new officers were elected: President, Edgar J. Buttenheim; vice-president, C. R. Wood; secretary, John A. Klenle; treasurer, Dennis O'Brien. The following firms were elected as members of the executive committee: "American City," Wallace & Tiernan; E. I. Dupont de Nemours Co.; Pittsburg-Des Moines Steel Co.; and H. Mueller Mfg. Co.

Edward Cole, president of the Pitometer Co., New York, was elected chairman of the New York Section of the association. Burt Hodgman, chief engineer of the National Water Main Cleaning Co., New York, was re-elected as secretary.

Entertainment.

Approximately eight hundred of the delegates enjoyed a sail down the Delaware River, as far as Chester, on Wednesday afternoon, May 17. The boat returned at 5.30 p.m., and that evening the ladies attended a theatre as guests of American Water Works Manufacturers' Assoc.

Exhibits.

Sixty-eight firms occupied booths in the exhibit room, which was beautifully arranged. The show of water works materials was the most complete and representative ever seen at a meeting of the association. "Better than ever" was the unanimous opinion regarding both the exhibit and the convention. The exhibitors were:

Payne Dean, Ltd., New York; Rensselaer Valve Co., Troy; Water Works Equipment Co., New York; "The American City," New York; Mathieson Alkali Works, Inc., New York; Pittsburgh Meter Co., East Pittsburgh, Pa.; "Public Works," New York; Pennsylvania Salt Mfg. Co., Philadelphia; Central Foundry Co., New York; "Fire and Water Engineering," New York; Van Gilder Water Meter Co., Atlantic City, N. J.; A. P. Smith Mfg. Co., East Orange, N. J.; Thomson Meter Co., Brooklyn, N. Y.; Union Water Meter Co., Worcester, Mass.; Pittsburg Des Moines Steel Co., Pittsburgh; National Tube Co., Pittsburgh; Lead Lined Iron Pipe Co., Wakefield, Mass.; Birch Pump Valve Co., Chicago; East Jersey Pipe Co., New York; De Laval Steam Turbine Co., Trenton, N. J.; Pitometer Co., New York; Kennedy Valve Mfg. Co., Elmira, N. Y.; Buffalo Meter Co., Buffalo; National Water Main Cleaning Co., New York; National Meter Co., New York; Sullivan Machinery Co., Chicago; Gamon Meter Co., Newark, N. J.; Eddy Valve Co., Waterford, N. Y.; Neptune Meter Co., New York; Layne & Bowler Co., Memphis, Tenn.; "Engineering News-Record," New York; W. & L. E. Gurley, Troy, N. Y.; Chicago Bridge & Iron Works, Chicago; Electro-Bleaching Gas Co., New York; Wallace & Tiernan Co., Inc., Newark, N. J.; United Brass Mfg. Co., Cleveland; R. D. Wood & Co., Philadelphia; "Engineering & Contracting," Chicago; Builders' Iron Foundry, Providence, R. I.; Hersey Manufacturing Co., South Boston, Mass.; Ludlow Valve Mfg. Co., Troy; Badger Meter Co., Milwaukee; Glauber Brass Mfg. Co., Cleveland; Hayes Manufacturing Co., Erie, Pa.; Leadite Co., Philadelphia; Ross Valve Mfg. Co., Troy; Simplex Valve & Meter Co., Philadelphia; E. I. DuPont de Nemours & Co., Inc., New York; W. P. Taylor Co., Buffalo; Worthington Pump & Machinery Corporation, New York; Lock Joint Pipe Co., Ampere, N. J.; Columbian Iron Works, Chattanooga, Tenn.; U. S. Cast Iron Pipe & Foundry Co., Burlington, N. J.; American Manganese Bronze Co., Holmsburg, Philadelphia; New York Continental Jewell Filtration Co., Nutley, N. J.; H. Mueller Mfg. Co., Decatur, Ill.; H. W. Clark Co., Mattoon, Ill.; "The Canadian Engineer," Toronto; Roberts Filter Mfg. Co., Darby, Philadelphia; Ford Meter Box Co., Wabash, Ind.; Permutit Co., New York; Garlock Packing Co., Palmyra, N. Y.; Warren Foundry & Machinery Co., New York; M. L. Bayard & Co., Inc., Philadelphia; International Filter Co., Chicago; Pittsburgh Testing Laboratory, Pittsburgh; A. T. Taft Mfg. Co., Cleveland.

REHABILITATION OF OLD PIERS TO REDUCE THE COST OF HANDLING FREIGHT*

Problems to be Considered in Constructing Piers and Handling Freight — Elaborate Scheme Proposed For Freight Terminals for Manhattan

By Francis Lee Stuart,
Vice-President, Am. Soc. of Civil Engineers.

DURING the last few years, there has been such wastage of capital expenditure and of the prime necessities of civilization, that one of the problems of this generation, is the proper use of such capital, as is now available, for the greatest benefit to mankind.

The engineer is essentially a creator of ideas, a creator of ideals, and a constructor of values; and today, more than ever, must he use his trained judgment to get the best out of existing structures and study the possibilities of rehabilitating present facilities, before he recommends or sanctions their destruction and replacement by new and supposedly more economically operated facilities.

Necessary new facilities, addition to present structures, and change of methods, all have their justification, but of all possible improvements to property the one that destroys existing facilities is the one that requires the greatest thought.

Because of the changing character of the business of a port this is particularly true of piers, and to such an extent, that there are very few cases where the destruction of an existing pier, seems to me, to be justified under the present world conditions.

To cut down operating expense is a desirable aim in any business and often its accomplishment is the difference between success and failure in the undertaking. In port matters, the competitive character of the various ports, makes such a reduction a necessity at times to induce or retain business.

Early in our history, vessels were berthed at quays, and later piers were built to allow for berthing a greater number of sailing vessels per linear foot of water-front than the quays afforded. These piers were narrow and seldom 100 ft. wide. This old policy of narrow piers has been repeated down through the ages, until today it is usually a false economy and the greater number of berths of the narrow piers are secured only by the sacrifice of quay or wide pier economies in handling cargo and quick turn around of ships.

The large cargoes of the present day, the machines used as substitutes for manual labor, and the necessity for the intensive use of the pier in order to get a proper return on the increased value of pier properties, often require the rehabilitation of these old piers to reduce the operating costs of transfer from land carriers to vessels and vice versa.

In dealing with this many sided problem, the writer has taken but a few of its phases for the purpose of discussion. Bulk cargo requires special piers with suitable machinery and is not under discussion.

Narrow Piers.

Case 1. A pier 600 ft. long and 100 ft. wide for handling general cargo and the necessity to get greater returns therefrom. It will berth two vessels, generally it should not be lengthened for four berths on account of its narrowness, rails on such a pier would be a nuisance, it is too narrow for cranes, and it is too narrow to work advantageously the outboard, until the inboard is off the deck.

The suggested addition would be the building of storage areas, such as warehouses or sheds, inshore, for the receipt of import and export freight, instead of using the railroad cars for such storage. The freight, which it is not practicable to transfer directly from vessel by tractor and trailer to cars, can be stored in such warehouse or shed,

and later distributed as needed to destination; and the freight, which it is not practicable to unload from arriving cars and carry direct to ship side, will be stored in warehouse and later taken by trailer to shipside. The object being to use the vessel, the cars, the tracks, the tractors and trailers, and the warehouses or sheds, as one unified plant to reduce the gross expenditure of money for operation.

Such an arrangement of storage addition to a pier, releases cars quickly, cuts down trucking cost, speeds up the turn around of the ship, and makes many economies in operation, usually all well worth the capital additions for the warehouse and sheds, even if the pier is narrow.

Group of Narrow Piers.

Case 2. Consider a group of piers, say three or four, of old narrow dimensions, with high operating costs; these can often have their value and efficiency cheaply increased, by the construction of a group of storage sheds or warehouses inshore, as described above, any part of which can be used as an auxiliary to anyone of the piers.

Baltimore Type of Pier.

Case 3. If physical conditions permit, the space occupied by a group of piers can, in some cases, be bulkheaded and filled in, in the shape of a self contained pier or terminal, say 1,000 ft. deep and 1,500 ft. wide with berthing spaces on three sides of the rectangle.

The idea embraced in such a marine terminal is a central storage area with compactly located tracks and platforms and cheap but efficient one storey warehouses surrounded on three sides by vessels and so designed and with facilities so laid out, that freight can be moved by direct routes and without fouling from any location in the storage area to any vessel berth.

On the sides and face of the pier are located double or single deck dock sheds, set back a sufficient distance from the bulkhead for the use of cranes or other machinery as well as Burton poles (pier masts).

In the interior of the pier, there are provided storage platforms or single storey sheds, ranked perpendicular to the face of the pier. Such sheds will be separated on one side by sunken railroad tracks and on the other side by street driveways. The sheds are to be divided into separate compartments by fire walls, and on the outside of the sheds on each side there should be built longitudinal runway platforms for use of tractors and trailers.

In the middle of such a terminal, for economy in operation, there will be cross gangways extending from the bulk-head shed on one side of the terminal to the bulkhead shed on the other side, such gangways crossing the sunken tracks and roadways on moveable bridges. As the terminal becomes busier, elevated cross galleries connected with the platforms by elevators could be used for a similar purpose.

In operation, such a typical pier terminal is served by tractors and trailers, and city trucks can reach all parts of the plant. The berths on the sides are to be equipped with light gantry cranes, straddling two flush tracks. The cargo of incoming ships is to be unloaded on upper deck of double deck dock sheds, and to be delivered to cars or to warehouse, via cross galleries, by tractors or trailers; the outgoing cargo is to be transferred from cars or brought from warehouses by tractors or trailers and loaded from lower deck.

On the front of pier the berths have one flush track and all will be served by Burton Poles (pier masts). The incoming cargo will be unloaded on upper deck and thence distributed by tractors and trailers, via galleries or platforms, to cars or warehouses; and outgoing cargo brought from cars or warehouses by tractors or trailers, will be loaded from lower deck.

The plan lends itself readily to any mechanical installation, such as belts or overhead runways from one or any number of berths. The average haul from the warehouses to the berths is several hundred feet shorter than to same number of pier type berths, and each berth is more

*Paper read at a meeting of the American Society of Mechanical Engineers, April 28.

effective than a pier berth, and with much less first cost per berth than the pier type of berth. The system of vessel berths, tracks, roadways, transfer sheds, storage areas, galleries, platforms and runways are in such relation to each other that they allow uninterrupted forward, backward and cross movement of materials with short average haul and forms a manufacturing plant for transfer of cargo from one carrier to another, which should result in large reductions in gross handling costs.

This idea has been patented in order to maintain unimpaired the underlying principles, as explained above, and out of fondness for the city I propose to call it the "Baltimore Type" of Pier.

Case 4. A large portion of water front of a port can be rehabilitated in a way which may defer the destruction and rebuilding of existing piers. Warehouse, belt lines, a change in methods of the port—one or all three may be the desirable means of accomplishing this end.

Hudson River Water Front.

Case 5. Late, as consulting engineer of the Hudson River Bridge Co. I have been studying as a part of that project, an interesting concrete example of this case,—the Hudson River water front of Manhattan.

Many dock commissioners of New York City have had plans to tear out piers on the waterfront and to replace them or otherwise change the existing structures. The New York and New Jersey Joint Commission, before the New York Port Authority was formed, published suggested changes of such water front, of widened piers, replaced slips, lengthened piers, etc.

In nearly all cases the proposed piers were to be replaced by water, larger and more up-to-date structures.

Such destruction, such replacement with better structures, etc., can be deferred by additions to the present waterfront property of the facilities which are under consideration in connection with the Hudson River Bridge undertaking.

The Hudson River Bridge is primarily to take care of the vehicular traffic of Manhattan. It is estimated that such traffic alone will support the Bridge proper.

The project is to be built by private capital and will cater to such other business as seems fitting under its charter and which will furnish revenues, which will add to the profit of the undertaking or reduce cost to all users.

On account of the length of the span it requires great width and depth of the floor system to meet the structural requirements of rigidity, and advantage has been taken of this, to work out a lower deck with a capacity to carry 12 railroad tracks which can furnish, when as found desirable, facilities for three other public needs, viz:

- 1st. Tracks for rapid transit suburban trains from New Jersey.
- 2nd. Tracks for passenger trains, other than for commuters, to a Union Station in Manhattan.
- 3rd. Tracks for freight deliveries direct to Manhattan.

Each or any one of these three facilities can be an independent unit, built and maintained and operated as a separate unit, as and when economically justified; or a combination of two or all three of the facilities can work together with resulting economies from such a combination.

Proposed Manhattan Freight Terminal.

The freight terminal proposed in Manhattan consists of a freight elevated railroad located on blocks, lying on the east side of West Street from 46th Street to Cortlandt Street. These elevated running tracks are encased in an almost continuous building, extending about $4\frac{1}{2}$ miles from 42nd Street to Cortlandt Street, the building being 200 ft. wide and five or more stories high. The cross town streets pass uninterrupted through the building to the marginal way.

The main or running tracks for both inbound and outbound traffic, switching and platform tracks and car loading platforms are located on the first and second floor of building.

The street floor is to be utilized for the delivery of freight to and from trucks. The floor above the track levels is to be used as a main freight house floor for temporary storage of such freight as will be transferred immediately from one carrier to another such as cars, trucks, etc. Above this there are to be two additional warehouse floors or lofts.

It is proposed that team track terminals occupy a number of entire blocks between 39th and 25th Streets.

The freight that is to be handled is L.C.L. freight and such full car load freight as will not be handled at the team tracks.

The operation of the marginal and team track terminals is conceived on the principle of one way traffic around loops and avoidance of fouling of traffic by crossover and backup movements. For this purpose the terminal is divided into two sections, one north of 14th Street and the other south of 14th Street. All traffic for the portion north of 14th Street passes around a loop of 14th Street without interference with traffic, which passes through to the section south of 14th Street; and all traffic for the latter section passes around the loop at Cortlandt Street.

For the purpose of terminal operation the marginal terminal will be divided into individual terminal units, each about 1,300 ft. long. Cars will be classified on the New Jersey side for these various terminal units. Car load lots inbound for individual terminal units will be delivered to the Terminal Company in New Jersey and delivered by them later to the Manhattan Terminal in standard cars without breaking bulk. Less than car load lots will be transferred to containers in New Jersey by original road or by operating company and then delivered to Manhattan.

Vice versa, outbound car load lots will be loaded direct into standard cars, and L.C.L. will be loaded into containers and moved to New Jersey to be classified, or transferred at Manhattan Terminal into proper road cars of the forwarding company.

The freight at Manhattan Terminals is to be handled largely by tractors and trailers or containers over the platform and by elevators between various floors, on the principle of one way traffic and avoidance of fouling. The trucks handling the street platforms for delivery of freight to and from terminals are similarly operated on the same principle of loops and with the proper use of all cross streets to disperse the traffic into the city without congestion.

One of the compelling reasons why this terminal was located along the east side of West Street and which had a great influence on the general design of the terminal, was the possibility of rehabilitating and rejuvenating the entire front of Hudson River between Cortlandt Street and 46th Street, and furnish large additional capacity to the existing piers.

The marginal terminal is provided with elevated galleries crossing West Street connecting the warehouse with the piers so that freight to and from the Terminal can be transported direct to and from shipside by tractors and trailers.

While it is believed that heavy cargo steamers must eventually seek the rail head connection in New Jersey, the Hudson River waterfront is used principally for steamers carrying passengers primarily, and incidentally high class freight. It is expected that such use of the waterfront will increase largely with such facilities as are contemplated.

Some portion of the cargo of these passenger ships will come by lighter but a growingly larger part can be brought direct by the railroad to the individual terminal units or section of the terminal opposite the vessel's pier, and the freight can be unloaded at the freight platforms as a terminal work and carried by trailer into an upper warehouse floor of the part of the terminal warehouse and held until called for by the ship's stevedores or vice versa. Or instead of passing such freight through the general warehouse floor a pier owner could lease a floor or floors of any size required, to handle such work through their

own agencies, and even bonded warehouse could be provided for unloading inbound cargo into.

Such a treatment of the problem is exceptional and as far as I know only justified in this section of Manhattan, but it is my opinion that in this case the proposed freight terminals in Manhattan will add greatly to growth of the shipping interests as well as the business interests of the port and with a very large saving in gross handling cost, as well as profit to the undertaking.

In addition to the physical treatment of these cases, there is a public field of vision which must be considered.

The economic value of the expenditure to the contributing community as well as to the owner and the amortisation policy used.

The justification of the proposed addition to the facilities of the port and of the section of the country tributary to the port.

The use of rates for zoning or other means for artificial divisions of the country to get the greatest benefit from the use of certain parts; these and many other influences must be considered.

It is a far cry from the physical rehabilitation of old piers to cut down cost of handling freight, to a proper interpretation of the value of these economic features, yet they have a very important bearing on the correct decisions and are stated here in closing to remind you of some of the public aspects of the problem which should be considered for the benefit of your clients.

MODERN CONCRETE PROPORTIONING

MEMBERS of the Halifax Branch of the Engineering Institute of Canada held a special meeting at the Nova Scotia Technical College on Wednesday evening, May 10, to listen to an address by Lt.-Col. H. C. Boyden on "Recent Developments in Concrete." Col. Boyden is a member of the engineering staff of the Portland Cement Association. His lecture summarized the results of investigations carried on under the direction of Prof. Duff Abrams of the Lewis Institute, Chicago, for that association.

Col. Boyden stated that the Portland Cement Association had reached the conclusion that concrete proportioning must be put on a more scientific basis in order that the resulting concrete should have a definite pre-determined strength. With this in view, Prof. Abrams had been selected by the association to take charge of laboratory investigations at the Lewis Institute. His instructions had not been very specific. He was simply to investigate concrete. He was not hampered by a time limit nor by lack of funds. His first report was not made until three years after beginning his investigations.

As a result of these investigations, said Col. Boyden, it was found that the older systems of concrete proportioning are inaccurate, and that instead of specifying a 1:2:4, 1:1½:3 or 1:2½:5 concrete, one should specify that at the end of 28 days the concrete should develop a strength of 2,000 or 3,000 lb. per square inch, or such strength as the work might require.

It was found that the water content is an important factor in concrete; a factor practically ignored by most specifications. In determining the proportions for a mix a factor known as the fineness modulus was computed from the sieve analysis of the aggregate. It was found that mixtures of fine and coarse aggregates having the same fineness modulus required the same amount of water to produce concrete of the same workability and give concrete of the same strength. The water is expressed as a function of the cement, a certain water-cement ratio giving a definite strength.

"Relative consistency" is measured by the slump test on a 12-in. cylinder of freshly mixed concrete. That quantity of mixing water that causes the cylinder to slump about one inch when the mould is withdrawn gives normal consistency, or relative consistency of 1.00. If a certain water-cement ratio produces a certain strength for a certain "relative consistency," and a wetter mixture is desired, the

same strength to be produced, then more cement must be added to keep the water-cement-ratio the same as in the drier mix. Thus a wet mixture, such as that used when the concrete is distributed by chutes, requires more cement, which means more expensive concrete. In deciding, therefore, whether to deposit the concrete by chutes, the saving thereby effected must be balanced against the added cost of the extra cement.

Col. Boyden is of the opinion that the scientific methods being evolved at the Lewis Institute will eventually supplant the present methods of concrete proportioning. At the present time some architects and engineers are specifying that the concrete should be proportioned, not by arbitrary quantities, but in such a way that a certain strength be attained at 28 days. Experiments have shown that a certain predetermined strength can be easily obtained within 10%, especially after one becomes accustomed to the methods employed.

Following the lecture there was a very interesting discussion. Col. Boyden stated that tests have shown that the strength of concrete does not depend on the hardness of the coarse aggregate. Tests have also shown that many "hardeners" and waterproofing powders are of doubtful value. The addition of one-thousandth part (by weight) of tannic acid to clean sand has seriously weakened the resulting test specimen, thus showing the harmful effect of organic matter in sand, even when present in very small quantities.

WELLAND CANAL PROGRESS

ABOUT 70 per cent. of the total construction work on the new Welland Ship Canal yet remains to be done. The work still to be done comprises the completion of sections 1, 2, 3, 4 and 5; the construction of sections 6, 7, 8 and 9; the lock gates, super-structure of bridges and minor details. The work completed comprises 63 per cent. of the work on sections 1 and 2; 51 per cent. of the work on sections 3 and 4 and 72 per cent. of the work on section 6.

The gross amount expended on the canal work up to March 31, 1922, was \$30,588,026.07, less a credit for cash received on account of the plant and materials, etc., from contractors for sections 1, 2 and 5 of \$1,147,761.25, less a further amount to be paid by contractors for sections 1, 2 and 5, in accordance with their contracts on account of plant, etc., totalling \$952,883.11; less a further \$2,151,655.88, which is the estimated value of plants, etc., to be taken over by contractors for sections 3 and 4, leaving a net expenditure on the work to March 31, 1922, of \$26,333,725.83, which sum includes other redeemable assets.

If ample funds are available for the purposes of the work the canal will be ready for traffic during the year 1927. At any rate, the Government will finish the work as soon as possible, and this year it will proceed with the construction of locks on sections 1, 2 and 3, and excavation on sections 1, 2, 3, 4 and 5.

Criticising the building codes and declaring that many designers of structures were dwelling too much on the element of safety because they were afraid to come forward and demand from contractors the proper concrete, Lieut.-Col. H. C. Boyden spoke before the Engineering Institute of Canada, Montreal branch, recently, on "Recent Development in Concrete." He said the failures in concrete buildings which have taken place are due to a disregard for the fundamental laws. These laws have been thoroughly proven, he said, and theories have now been replaced by facts.

According to information received in Victoria, J. G. Sullivan, late chief engineer of the Canadian Pacific Railway will shortly be appointed to act as engineer in the investigation of the Pacific Great Eastern Railway in accordance with the announcement made by Premier Oliver at the last session of the British Columbia legislature.

OFFICIAL PROGRAM FOR GOOD ROADS CONGRESS

OFFICIAL programs of the ninth annual convention of the Canadian Good Roads Association to be held in Victoria, B.C., from June 12 to June 15, have been sent out by George A. McNamee, secretary, to federal and provincial members of parliament, municipal councils and engineering, good roads and automobile organizations. The eastern delegation to the convention, which will comprise representatives of the Maritime provinces as well as of Quebec and Toronto will leave Montreal and Toronto on Tuesday evening, June 6, arriving at Victoria on June 10, and other delegations will join up en route so that the good roads' enthusiasts will arrive in Vancouver together.

The special railroad rates available for the convention will be interchangeable on both the C. P. R. and the C. N. R. and will be good for returning until October 31, so that visitors will have an excellent opportunity of seeing the country and making a circular tour. The chairman of the Entertainment Committee is J. L. Beckwith.

Monday, June 12.

9.00 A.M.—Registration of delegates and visitors at Convention headquarters.

First Session.

10.00 A.M.—Congress called to order by the president of the Canadian Good Roads Association, Hon. Sam. J. Latta, minister of education, Province of Saskatchewan.

Second Session.

2.30—Address by Presiding Officer: Hon. Sam. J. Latta, president, Canadian Good Roads Association.
Address by Hon. J. H. King, minister of public works, Ottawa, Ont.

Address by Hon. S. F. Tolmie.
Paper: "Experiments in Improving and Maintaining our Prairie Roads," by Prof. K. A. Clark, University of Alberta.

Discussion by M. A. Lyons, chief engineer, Manitoba Good Roads Board.

Paper: "Drainage Methods for Prairie Roads" by Professor of University of Saskatchewan.

Discussion by C. W. Dill, superintendent of highways, Province of Saskatchewan.

Paper: "Bituminous Treatment of Gravel and Sand Roads," by A. B. Fletcher, state engineer, Sacramento, Calif.
Discussion by chief engineer, Province of Alberta.

4.30 P.M.—Appointment of Nomination and Resolutions Committee.

8.00 P.M.—Good Roads theatre party.

TUESDAY, JUNE 13.**Third Session.**

10.00 A.M.—Presiding Officer, J. L. Beckwith, Victoria, B.C.
Address by A. W. Campbell, commissioner of highways, Dominion Government.

Address by Hon. P. J. Venlot, minister of public works, New Brunswick.

Paper: "How to Improve Earth, Clay and Sand Roads," by J. D. Robertson, deputy minister of public works, Alberta.

Paper: "Gravel Roads," by A. R. Hirst, state highway engineer, Wisconsin.

Discussion by B. M. Hill, chief engineer, highways department, New Brunswick.

Fourth Session.

2.30 P.M.—Presiding Officer, J. A. Duchastel de Montrouge.
Address by Hon. J. L. Perron, minister of roads, Quebec.

Paper: "Cement Concrete Roads," by James Allen, supervisor of state highways, Olympia, Wash.

Discussion by A. E. Foreman, district engineer, Portland Cement Assn., Vancouver, B.C.

Paper: "Road Machinery," by F. L. MacPherson, department of public works, Victoria, B.C.

Discussion by Geo. Hogarth, chief engineer, Province of Ontario.

3.30 P.M.—Annual general meeting Canadian Good Roads Association, Reception of annual report, financial statement, auditor's report, and election of directors and officers for the ensuing year.

Paper: "Colonization Roads," by W. F. Fullerton, superintendent of colonization roads, Ontario.

8.00 P.M.—Informal Reception of Delegates at Government House, by Hon. W. C. Nichol, Lieutenant-Governor of the Province.

WEDNESDAY, JUNE 14.**Fifth Session.**

10.00 A.M.—Presiding Officer: S. R. Henderson, president, Manitoba Good Roads Assn.

Address by Hon. F. C. Biggs, minister of highways, Ontario.
Address by Patrick Phillip, public works engineer, Province of British Columbia, Victoria, B.C.

Paper: "Asphaltic Concrete Pavements," by F. L. Fellowes, city engineer, Vancouver, B.C.

Discussion by R. G. Davidson, Warren Bros., Portland, Ore.

Paper: "The Motor Truck; Maximum Weights, Speed, Width, Etc.," by Windsor T. White, chairman, motor truck committee, National Automobile Chamber of Commerce, New York City.

12.30 P.M.—Annual Meeting Canadian Automobile Assn.

Sixth Session.

2.30 P.M.—Presiding Officer: T. J. Mahony, past president, Ontario Good Roads Association, Hamilton, Ont.

Paper: "Provincial Highway Legislation Compared," by F. G. Pearson, past president, Nova Scotia Good Roads Assn., Halifax, N.S.

Paper: "Foundations," by J. A. Duchastel de Montrouge, manager and city engineer, Outremont, P.Q.

Paper: "Surface and Subsoil Drainage," by W. A. McLean, deputy minister of highways, Ontario.

Discussion by A. McGillivray, chairman Manitoba Good Roads Board.

5.30 P.M.—Meeting of newly elected board of directors of the Canadian Good Roads Association, for appointment of committees, etc.

7.30 P.M.—9th annual dinner and entertainment, at Empress Hotel, (informal). Tickets to delegates at special rate of \$1.00.

THURSDAY, JUNE 15.**Seventh Session.**

10.00 A.M.—Presiding Officer, F. A. Gillis, president, Nova Scotia Motor League, Halifax, N.S.

Address by J. B. Harkin, commissioner, Canadian National Parks, Department of Interior, Ottawa, Ont.

Address by J. P. Hartman, Seattle, Wash.

Paper: "Bridges and Culverts," by A. S. McMillan, superintendent of Nova Scotia highways.

Paper: "Road Dragging and Maintenance Competitions," by H. S. Carpenter, deputy minister of highways, Saskatchewan.

Eighth Session.

2.30 P.M.—Presiding officer: H. H. Shaw, chief engineer, department of public works, Prince Edward Island.

Paper by Herbert Cuthbert, executive secretary, Pacific Northwest Tourist Ass'n. "Tourist Traffic."

Discussion by Geo. Webster, Calgary, Alta.

Paper: "How to Finance Road Construction, Bonding and Revenue" by Newell D. Darlington, chairman, California Highways Commission, Sacramento, Cal.

Discussion by Wm. Findlay, Toronto, Ont.

Paper: "Economical Methods of Handling Materials," by Major H. L. Bowby, office of public roads, Washington, D.C.

Paper: "Maintenance," by George Henri, chief engineer, Quebec highways department.

8.15 P.M.—Social Evening and Dance, Empress Hotel.

Most of the people mentioned in the program have already accepted the invitation extended to them, but there may be some changes at the last minute, and the executive have made full provision so that the interesting subjects outlined shall be fully discussed by the convention.

BUILDING OPERATIONS ON THE INCREASE

RECENT building statistics indicate that not only in this country but also in the United States building operations are very much more extensive than they were for corresponding period last year. Considering the situation on the continent as a whole it is of interest to note that in twenty of the largest cities of the United States the building permits for the month of March were 134% greater than they were for the corresponding month of 1921, and that for 190 cities in the United States the increase over March 1921 was 99%. While perhaps not so remarkable, the increase in Canada has been notable and it might fairly be said that we are in the midst of something approaching a building boom.

An interesting fact concerning this activity is that it largely arises from the building of houses. Whereas, in 1919 and 1920 large numbers of industrial buildings and theatres were constructed, there appears to be little of that class of building now in progress. The country is undoubtedly overbuilt so far as factories and amusement places are concerned and is now catching up in a very legitimate and much needed class of construction.

OPERATION COSTS OF MOTOR BUSES

IN spite of the extensive use of motor buses in America, the published figures of the cost of operation appear to lack consistency and reliability as a basis for estimating probable cost of service in a new locality. An enquiry recently conducted by a committee of the New England Street Railway Club brought out the fact that one reporting company operated at a cost of 28.08 cents per

bus-mile for a 25-passenger bus and the other company answering the questionnaire at a cost of 34.50 cents per bus-mile for a 19-passenger bus. These figures do not include any allowance for dead mileage or for the use or maintenance of the highway. The latter item should, of course, be added to operating costs in any comparison with rail transportation.

Comparison with these figures with those reported by the Massachusetts Public Utilities Commission is of interest. Including taxes and interest on investment at 8%, the cost per bus-mile for a 19-passenger bus was reported by operating companies at 24.26 cents. It was estimated by the commission's engineers that the cost for a 30-passenger bus should be 23.67 cents and for a 51-passenger bus 53.9 cents per bus-mile.

An interesting observation is made by the New England committee to the effect that there are really no reliable data concerning the cost of operation of trolley buses in America. The committee consequently was forced to estimate the probable cost on the basis of experience in Leeds and Tees-side in England. This cost for a trolley bus having a capacity of 25 was estimated at 25.51 cents for New England conditions. The Massachusetts Public Utilities Commission has, on the basis already described, estimated the cost for trolley buses for a 30-passenger bus at 20.59 cents per bus-mile.

The divergence of these figures indicates the impossibility of any prospective user of the motor bus or trolley bus being able to state by analogy with other localities what the probable cost of the operation will be for a new service. The decision of the Toronto Transportation Commission to try out, both the motor bus and the trolley bus under the peculiar conditions existing in Toronto for a sufficient period of time to demonstrate the exact economic characteristics of these services is undoubtedly a piece of sound engineering policy.

STRESSES IN SKEW ARCHES

LITTLE information concerning the distribution of stresses in skew arches has hitherto been available to the designing engineer. It has consequently been assumed by many that the skew arch may be treated in the same manner as the right arch, assuming the span to be the distance face to face of abutments measured parallel to the centre line of the roadway. This is the method outlined by Rankine and many other writers since his time.

Many instances of behavior of skew arches contrary to the assumptions of this theory are now known to the profession. Some twenty years ago a large skew Monier arch collapsed in Australia with loss of life. An investigation conducted by Professor W. C. Kernot, of the University of Melbourne, established beyond doubt that the commonly accepted method of calculating skew arches was seriously in error. Certain recommendations were made by him for thickening up both the arch ring and the abutment at the obtuse angle of the arch, or, what is the same thing, at the acute angle of the abutment. These recommendations were based on the ascertained fact that there was a great concentration of stress along the short diagonal of the horizontal projection of the arch and that the thrust per lineal foot of abutment was much more intense at the acute angle of the abutment than near the obtuse angle.

Recent investigations made by Professor Clyde T. Morris, of the Ohio State University, and described by him in Engineering News-Record substantiate the general conclusions arrived at by Professor Kernot and others. A model skew arch of 4-ft. span and 3-ft. length, skewed at 45 deg. was constructed and tested under various loadings. Both the vertical and horizontal components of the resultant reaction were measured by means of specially devised springs and it was found that these resultant components act very near the obtuse angle of the arch. Indeed, observations showed that there was even indication of a slight uplift at the acute angle.

The investigations of Professor Morris will be welcomed by engineers who have had to design and report upon skew arches with a somewhat unsatisfactory amount of data at their disposal. Appreciation of the actual stresses existing in structures will be greatly facilitated not only by the laboratory experiment mentioned above, but also by the practical observation of stresses in the skew arches of two bridges over the Scioto River in Columbus, Ohio, now being carried out by Professor Morris. While the indication of the tests of models is definite and pronounced, the results of tests on actual structures of full size will carry greater conviction with practicing engineers.

PERSONALS

WILLIAM B. BOYD, the new president of the Dominion Alloy Steel Corp., Ltd., was born in 1871 at Markham, Ont. He attended the Collegiate Institute in Mark-

ham, and afterwards entered the Armour Institute of Technology in Chicago. His first important work was at the World's Columbian Exposition in Chicago. In 1891, where he was placed in charge of the electrical installation of the Art Building, and also of the Administration Building, each building containing 20,000 lights, and after the construction period was appointed chief electrician in charge of lighting and power, approximating 60,000 h.p., by the Westinghouse Electric and Manufacturing Co. of Pittsburg, and remained in this capacity until the close of the

Exposition. He was then appointed electrical and mechanical engineer at the works of the Westinghouse Electrical and Manufacturing Co., Pittsburg, where he remained from 1893 to 1897, obtaining a thorough grounding in his profession through the general courses of training at these works. His next appointment was that of assistant chief electrical engineer of the Illinois Steel Co., Chicago, with an electrical installation of approximately 100,000 h.p. He remained there from 1897 until 1901 in charge of the electrical equipment in all their power stations. In 1901 he was appointed chief electrical engineer of the Dominion Iron and Steel Co., at Sydney, which position he held from 1901 to 1906. In the latter year he became associated with the Toronto Power group headed by Sir William Mackenzie, Sir Henry Pellatt and the late Hon. Frederic Nicholls, and for eight years occupied high positions of trust as consulting and chief engineer in various engineering problems in both construction and operation. He was chief engineer for the Toronto Railway Company; chief engineer for the Electrical Development Co., at Niagara Falls, where he was in full charge of operation of the Niagara Power plant; chief engineer for the Toronto and Niagara Power Co.; and chief engineer for the Toronto Power Co. At present Mr. Boyd is chief electrical engineer of the Toronto and York Radial Railway, and of the Sudbury-Copper Cliff Electric Railway. He is also consulting electrical engineer to the Howard Smith Paper Mills, Ltd., the Maple Leaf Milling Co., and the Ontario Railway and Municipal Board. Between the years 1913 and 1918 he also acted as electrical engineer for the Canadian Northern Railway electrification for the Toronto and Eastern Railway, the Montreal tunnel

and Terminal Co., and the Toronto Suburban Railway. Mr. Boyd is a member of the Electrical Sectional Committee of the Canadian Engineering Standards Association, and also is a member of the Institute of Electrical Engineers of Great Britain.

W. SMITH has been appointed acting city engineer of Brandon, Man.

D. E. KRICK has been appointed road superintendent for Gainsboro Township.

G. A. MCCARTHY, former head of railway and bridges section, has been made head of the sewer section of the city Works Department, Toronto.

THOMAS TAYLOR has been appointed chief of the bridge section of the Works Department, Toronto. Mr. Taylor designed the Bloor Street viaduct in that city.

HERBERT PHILLIPS has been requested by a joint committee of the Halifax City Council and Board of Trade to go to that city and assist in making a check of the valuation of the Nova Scotia Tramways and Power Co.'s physical property as compiled by Jackson & Moreland, of Boston.

OBITUARIES

WILLIAM H. SMITH, builder and contractor, who recently died in Toronto, was born at Scugog Island, Ont., 60 years ago, but had lived in Toronto 40 years.

CHARLES VIRTUE, builder and contractor of Toronto, died in that city on May 17, aged 49. Mr. Virtue was born at Tyrone, Ont., but left to reside in Toronto about 25 years ago.

JOHN HENRY SHAW, widely known in Northern Ontario as the result of many years work as a civil engineer and land surveyor, passed away at North Bay, Ont., on May 12, aged 55. His work included the surveying of a large portion of the mining areas of Cobalt, and even as far north as the Porcupine. Mr. Shaw took a deep interest in the proposed Georgian Bay canal and the French River Improvement scheme.

It is reported that the Dominion Construction Co. of Toronto, has been awarded a contract for the construction of a freight terminal at Niles, Mich., for the Michigan Central Railway. A current authorization of \$500,000 is said to have been made to cover, principally, 320,000 cu. yds. of excavation; the construction of the eastbound hump and eight 100-car receiving tracks; 400,000 cu. yds. of embankment and twelve 100-car tracks of a twenty-five track classification yard, together with a permanent connection with the south end division tracks. It is intended to complete the entire project in 1923.

The province of Quebec, in 1921, laid down 416 miles of good roads, of which 55.5 miles were waterbound macadam, 322.7 miles were gravel, 12.8 miles were bituminous macadam, 12.6 miles were concrete, and 5.6 miles were macadam with cold patch. Over 4,000 miles of good roads are now being kept in thorough repair in Quebec province.

The dates for the annual convention of the American Society of Municipal Improvements which is to be held in Cleveland, Ohio, has been changed by the executive committee, the new dates being October 2-6, 1922. It had been planned to hold the convention from the 9th to 13th of October.

Work on the extension of the Timiskaming and Northern Ontario Railway, northwest from Cochrane, is now well under way. It is planned to complete the proposed 70-mile extension to the T. & N. O. from Cochrane to Tin Can Portage by 1923. Forty-seven miles will be built this year. Next month track laying is to commence. When the whole 70-mile extension is completed, the Ontario government may then consider the advisability of a line to James Bay.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand or proposed, contracts awarded, changes in staffs, etc.

TENDERS PENDING

The following tabulation is presented as a reminder to contractors in regard to tenders that are still pending, other than those reported in this issue. The word "Issue" refers to the issue of "Canadian Engineer" in which there appeared a notice giving details regarding the call for tenders.

Place of Work	Tenders Close	Issue
North Oxford Tp., Ont., construction of concrete abutments for bridge, also building of grade to bridge....	May 27	May 9
Toronto, Ont., installation of one four-million Imperial gallon centrifugal pump at Island Pumping Station....	June 13	May 9
Dungannon, Ont., construction of overflow drain	May 24	May 9
Ottawa, Ont., various work on Civic Hospital	May 25, 30, June 1	May 9
Waltham, Ont., construction of dam.....	June 1	May 9
Quebec, Province of, macadamizing of Levis-Jackman highway	May 29	May 9
Saskatchewan, Province of, construction of concrete bridges	May 29	May 9
Nassau, New Providence, Bahamas, dredging	July 15	May 9
Edenwold R. M., Sask., road work.....	June 5	May 16
Quebec, Province of, resurfacing of part of Montreal-Ottawa highway	May 30	May 16
St. Catharines, Ont., construction of pavements, etc.	May 25	May 16
Welland, Ont., construction of bituminous penetration road	May 24	May 16
St. Catharines, Ont., construction of sewers	May 25	May 16
Galt, Ont., erection of mill building.....	May 30	May 16
West Luther Tp., Ont., construction of municipal drain	May 27	May 16
Arran Tp., Ont., construction of bridge	May 26	May 16
Caledonia, Ont., construction of two concrete bridges	June 1	May 16
Palmerston, Ont., concrete pavement	May 25	May 16
Quebec, Province of, resurfacing of roads	May 30	May 16
Dixie, Ont., erection of public school building	May 27	May 16
London, Ont., construction of concrete grain tanks and warehouse	May 27	May 16
Moose Jaw, Sask., addition to land titles office	June 1	May 16
Ontario, Province of, construction of a continuation school and alterations to stock judging pavilion at New Liskeard, and erection of school at Monteith	May 27	May 16
Osnaburck & Williamsburg Tps., Ont., construction of drain	June 5	May 16
Ottawa, Ont., masonry, brick and carpentry work, Civic Hospital	May 30	May 16
Stratford, Ont., asphalt paving.....	May 29	May 16
Haldimand County, Ont., concrete bridges	June 1	May 16
Whitchurch Tp., Ont., culverts	May 26	May 16

BRIDGES, ROADS AND STREETS

Alberta, Province of.—Provincial Government intends to complete this year a number of broken pieces of road paralleling the Tofteld, Hardistry and Alsask lines of railway.

Binbrook, Ont.—Tenders will be received by John E. Peart, Clerk, Wentworth County, Hamilton, until 12 o'clock noon, May 20, for the construction of approximately 9,500 sq. yds. of concrete pavement, to commence at the village of Binbrook. Plans and specifications may be seen on application at the office of the County Clerk, Court House, Hamilton.

Blenheim Tp., Ont.—Contract for abutments and steel bridge over Smith's Creek has been awarded to the Stratford Bridge and Iron Works Co., Stratford.

Brant Tp., Ont.—Tenders will be received until noon, Friday, June 2, for steel bridge and abutments. (See official adv.).

Brantford, Ont.—City Council intends to construct asphalt pavements on Chatham Ct., Church St., Colborne St., George St., Nelson St., Palmerston Ave. and Wellington St., at a total estimated cost of \$64,540.15. City Clerk, H. F. Leonard.

Bridgeburg, Ont.—The Canadian Niagara Boulevard Commission has promised definitely to extend the highway the extra five miles from Queenston to Niagara.

British Columbia, Province of.—Contract for the construction of the first nine miles of the Nelson-Ymir highway, south from Nelson, has been let to DeWolf & Ham, of Cranbrook, at \$79,029.07.

Chatham, Ont.—Tenders will be received by L. A. Pardo, Road Superintendent of Kent County, until noon, Saturday, May 27, for the construction of three concrete and steel bridges, one of 34 ft. span, one of 12 ft. and one of 4 ft. span. Plans and specifications may be seen at office of W. G. McGeorge, C.E., Chatham.

Chatham, Ont.—Tenders will be received by L. A. Arthur, Clerk, Chatham Township, until noon, Saturday, May 27, for the construction of four concrete and steel bridges, one bridge of 40-ft. span and the others of 50-ft. spans. Plans and specifications may be seen at office of W. G. McGeorge, C.E., Chatham.

Chatham, Ont.—Contract awarded to S. P. West, of Sandwich, at \$1.90 per sq. yd. for concrete, and 72c per sq. yd. for excavating sub-grade, for paving within the sub-area of Kent County at Chatham. Other tenders received were: Johnson Bros., \$2.44 and 65c; Cadwell Construction Co., \$2.17 and 60c; Merlo, Merlo & Ray, \$2.40 and 70c; McNamara Bros., \$2.92 and 90c; Geo. H. Connebear, \$3.25 and 80c; W. J. Looby, \$2.43 and 65c; J. E. Caughey, \$2.78 and 79c; Geo. Cutter Co., \$3.05 and 76c; and Lumsden Eng. & Trans. Co., \$2.94 and 65c.

Chatham, Ont.—Tenders received for the construction of concrete base and curb on Lowe, Wilson, Cornhill, Ursuline and Adelaide Sts. were not considered satisfactory by the City Council and were referred back to the committee for report. Tenders were as follows: George Connibear, concrete base, 70c, curb, 20c; G. Fielder, Lowe St. base, 69c; Wilson base, 69c, Cornhill, 71c; Ursuline, 72c; Adelaide, 75c; curb on all streets, 18c. If given all the work, base 68c and curb 17c. Board of Works Department's prices were: Curbs on all streets mentioned, 18c; base Lowe St., 60c; Wilson, 62c; Cornhill, 60c; Ursuline, 62c; Adelaide, 60c.

Chatham, Ont.—Following contracts let for construction of concrete pavements in Kent County: To Merlo, Merlo & Ray, Walkerville, for 1½ miles near Thamesville, at \$2.63 per sq. yd. for paving and 60c for sub-grade. Other tenders received: Lumsden Contracting Co., \$2.93 and 65c; J. E. Caughey, \$2.88 and 60c; McNamara Bros. & Thornton, \$3.12 and 60c; G. W. Cutter Co., \$2.99 and 50c. For 5½ miles between Wallaceburg and Dresden, J. E. Caughey, Wallaceburg, at \$2.16 per sq. yd. for paving and 60c for sub-grade. Other tenders received: Merlo, Merlo & Ray, \$2.25 and 60c; G. W. Cutter Co. \$3.06 and 50c; Cadwell Sand & Gravel Co., \$2.27 and 60c; McNamara Bros. and Thornton, \$3.03 and 60c; S. P. West, \$2.10 and 65c. Above prices are all on basis of contract of supplying all material.

Cloverdale, B.C.—Contract for clearing, grubbing, grading and gravelling about 1,000 ft. of the Bjornson road from the Semlahmoo trail south has been awarded to Carmack & Tillotson. Work has started.

Cornwall, Ont.—Approximately \$50,000 will be expended by the United Counties of Stormount, Dundas and Glengarry on road work, contracts for which have been awarded to F. M. Eagleson, of Winchester; S. Gauthier, Moose Creek; Mr. McCallum, Apple Hill; and Neil McDonald, Alexandria.

Cornwall, Ont.—Tenders will be received until one o'clock, p.m., Thursday, May 25, for the construction of 1,000 cu. yds. of waterbound macadam in Williamsburg Township for the United Counties of Stormount, Dundas and Glengarry. Plans and specifications may be seen at the office of J. G. Cameron, County Road Supt., County Bldgs., Cornwall, Ont.

Dresden, Ont.—Contract awarded by Town Council for construction of pavements to the Cadwell Sand & Gravel Co. Other tenders received were: J. E. Caughey, Geo. W. Cutter Co., Johnson Bros. Co., Ltd., Merlo, Merlo & Ray, Ltd., Hamilton Contract Co., Ltd., and McNamara Bros. & Thornton.

East Zorra Tp., Ont.—Township Council passed by-law authorizing expenditure of \$12,000 on township roads. Clerk, Edwin Parker, Tavistock.

Fenelon Falls, Ont.—Council plans to pave Lindsay and Colborne Streets complete. Clerk, E. Fitzgerald.

Ford City, Ont.—Contract let by Town Council to Merlo, Merlo & Ray for repairing pavement on Sandwich St.

Ford City, Ont.—Town Council let contract for silex walks to the Cadwell Sand & Gravel Co., Ltd., at \$7,434.70. Other tenders received: Oakwood Construction Co., \$8,531; L. J. Ryan, \$7,988; Geo. S. Currie, \$7,811; B. Oldani & Co., \$8,723.80; Premier Construction Co., \$7,663; Coloutie Bros., \$7,615.40.

Galt, Ont.—City Council intends to construct an asphaltic concrete pavement on the north side of Main St., from Elgin St. to City Limits, at a cost of \$3,300. City Clerk, Joseph McCartney.

Hamilton, Ont.—Tenders will be received by John E. Peart, Clerk, Wentworth County, Court House, until 12 o'clock noon, May 30, for the construction of approximately 9,500 sq. yds. of concrete pavement to commence at the village of Binbrook, County of Wentworth. Plans and specifications may be seen on application at the office of the County Clerk, Court House, Hamilton.

Hamilton, Ont.—Hon. F. C. Biggs, Minister of Public works and Highways for Ontario, has announced the following road building program to be carried out in Wentworth County this year: Main Street road from city limits to fork of King & Main, just below Stoney Creek, concrete (contract let); Main Street road from the fork to Winona P.O., five miles, asphalt concrete; Hamilton-Brantford road, unfinished portion between Ancaster Village and the county line, asphaltic concrete (under contract); foundation work on the Hamilton-Galt road in Wentworth County to be finished this year; three miles of surfacing from Clappison's Corners to Black's Corners; foundation work on the Dundas Road, from Clappison's Corners through Waterdown to the county line, finish the foundation work on the Hamilton end of the Toronto-Hamilton Highway, the road expected to be open by July 1; three miles of foundation work

on the Caledonia road further south than the three miles completed last year. Mr. Biggs estimated that when completed, Wentworth County will have 62 miles of provincial highway at an average cost of \$25,000 a mile, or a total cost of \$1,550,000.

Hull, Que.—City Council will send a delegation to request the Minister of Public Works to have approach to Chaudiere Bridge repaired.

Humberstone Tp., Ont.—Township Council plans an expenditure of \$15,050 on township roads this year. Clerk, A. E. Near, Port Colborne, Ont.

Kenilworth, Ont.—Contracts for three small concrete bridges for Arthur Township were let to John Ashwood, of Kenilworth, for \$8.40 per cu. yd. Quite a number of tenders were received, running from \$8.40 to \$13 per cu. yd.

Kirkland Lake, Ont.—A plan is under way to petition the Ontario Government to extend the Kirkland Lake Highway another six miles so as to connect up with that part of the old road from Dane Station to the Argonaut mine at Beaverhouse Lake.

Kitchener, Ont.—The following streets will be paved this summer: Union, from King to Herbert; John, from King to Willow; Allan, from King to Willow; Mary, from Union to Allan; Willow, from Allan to Erb; Erb, from Willow to Peppier; and Victoria, from Erb to Weber Streets. City Engineer, S. Shupe.

Knowlton, Que.—Tenders addressed to J. E. Fay, Sec.-Treas., Municipality of the County of Brome, Knowlton, Que., until 10 o'clock a.m., May 27, for the construction of an iron or metallic bridge with concrete piers, and the approaches of said bridge, between the local municipalities of the Townships of Brome and Sutton. Plans and specifications may be seen at office of Secretary-Treasurer.

Lachine, Que.—Provincial Government will finance the construction of the Summerlea roadway in this municipality.

Lambeth, Ont.—Surveyors are now engaged in laying out the extension of the Lambeth highway beyond this village to Talbotville, from which point the contract has already been let for a section of paved road leading into St. Thomas. It is also understood that the Crumlin road will be paved this year, from the city limits to three miles east.

Lindsay, Ont.—Colborne St. will be paved this summer with asphaltic concrete by the Standard Paving Co.

London, Ont.—City Council considering the paving of Wharncliffe Road North this year. City Engineer H. A. Brazier.

London, Ont.—A movement is now under way to have Queen's Ave. widened 10 ft. between Richmond and Waterloo Sts. City Engineer, H. A. Brazier.

London, Ont.—Tenders will be received by John M. Moore & Co., Architects, London, until noon, Wednesday, May 31, for the construction of a steel and reinforced concrete bridge over the north branch of the River Thames, London. Plans and specifications may be seen at the office of the architects, or at the office of R. E. W. Hagarty, Consulting Engineer, Temple Building, Toronto.

Lucan, Ont.—Village Council decided to pave Main St. Clerk, Walter L. Gibson.

Manitoba, Province of.—Tenders are being called by the Provincial Government for the stumping and grubbing of five miles of the Keewatin-Manitoba boundary road, from mileage two to mileage seven. It is expected that grading of the road will be proceeded with as soon as this stumping and clearing is done. Plans and specifications of this work are in the offices of the Northern Development Branch at Kenora and Dryden.

Mimico, Ont.—Tenders for the construction of a large number of pavements are to be called shortly. Town Clerk, J. A. Teller.

Montreal, Que.—Executive Committee of City Council decided to re-floor the Vian bridge at an estimated cost of \$1,000, city to do work by day labor.

Montreal, Que.—Executive Committee recommended to City Council that William McNally & Co. be awarded a contract for supply of 100,000 granite blocks at \$112

per 1,000 blocks. Two other bids were received for \$118 and \$120, respectively.

Montreal, Que.—The repavement of Wellington St., from McGill to the limits of Verdun, at an estimated cost of \$250,000, is one of the important street improvements to be undertaken by the Executive Committee of the City Council this year. Granite blocks will be used from McGill to Bridge St., and from Bridge St. to the tail race, the paving material will be asphalt.

Montreal, Que.—Tenders addressed to the Executive Committee for the construction of concrete sidewalks on Boyer St., Bordeaux St., Ash St., Kelly St., Labrecque St., St. Lawrence Boulevard and St. Joseph Boulevard, will be received at the City Hall until May 26. Specifications may be obtained at the office of the Roads' Branch, Department of Public Works, City Hall.

Nelson, B.C.—Tenders closed May 20 for construction of approximately three miles of city streets. City Clerk, W. E. Wasson.

Niagara Falls, Ont.—Engineers of the Michigan Central Railway are here discussing plans for the proposed bridge to displace the present cantilever bridge.

Niagara Falls, Ont.—Plans submitted show that great changes will be made in the bridges here. A complete new structure will be built between the present cantilever bridge and the one used by the Grand Trunk and for pedestrian traffic. The contract for the latter calls for its completion within two years. The lower bridge will be greatly extended. At present there are two tracks on the upper decks, and vehicle and foot roadway on the lower deck. By the improvements projected the bridge will be widened to one hundred feet in width. The upper deck will carry four railroad tracks. The lower deck will carry a double track trolley line through the centre portion. On either side of these will be a wide roadway for automobile or other vehicular traffic. Entirely outside the bridge structure on the sides of the lower deck will be sidewalks for foot traffic.

Normandy Tp., Ont.—Tenders addressed to R. H. Fortune, Township Clerk, Ayrton, Ont., until 6 p.m., Friday, May 26, for the construction of three girder bridges. Plans and specifications may be seen at the office of the Township Clerk or R. McDowall, Township Engineer, Owen Sound.

Ontario, Province of.—George Hart, of Picton, has been awarded the contract for building the Provincial highway between Union Hill and Belleville.

Ontario, Province of.—Somerville & Dilworth have started work on a Provincial road contract from St. David's Hill to Niagara Falls, a distance of about 2½ miles. Concrete construction.

Ontario, Province of.—Hon. F. C. Biggs, Minister of Public Works and Highways, stated that \$1,500,000 will be spent in the Hamilton district on good roads this year. This will include cost of foundation of Galt-Hamilton road.

Ontario, Province of.—Hon. F. C. Biggs, Minister of Public Works and Highways, promised a deputation which called on him recently on behalf of the North Yonge Street Highway Improvement Association, that he would send an official from his department to report on the possibility of the scheme the deputation had presented to him. This scheme is a plan for widening Yonge St. to 100 feet from the city limits to Mulock's Corners, north of Aurora.

Oshawa, Ont.—By-law will be submitted to ratepayers on June 10 authorizing the purchase of a 1,000-gallon street flusher at a cost of \$7,900.

Oshawa, Ont.—Town Council adopted an extensive program of new pavements and sidewalks for this year, and instructed Town Engineer W. C. Smith to prepare plans and specifications for concrete and asphalt and advertise for tenders for laying same.

Oshawa, Ont.—Board of Works recommended to Town Council the paving of Albert St. to the C.P.R. bridge; Ritson Road, from King St. to Olive Ave.; and Avenue St., from Simcoe to Centre. Tenders will be invited for concrete and bitulithic.

Ottawa, Ont.—Final reading was given in the House of Commons to the bill of the Canadian Translt Co. which

is to build an international bridge between Windsor and Detroit. The bill now goes to the Senate.

Ottawa, Ont.—Tenders will be received by T. H. Byrne, Engineer, Carleton County, Ottawa, until 12 o'clock noon, Friday, May 26, for the construction of (a) bituminous penetration on Richmond Road, township of Nepean; (b) bituminous penetration in village of Carp, township of Huntley; (c) bituminous penetration in village of Osgoode, township of Osgoode; and (d) waterbound macadam on Base Line Road and Cyrille Road, township of Gloucester. Plans and specifications may be seen at office of Patterson & Byrne, 71½ Sparks St., Ottawa.

Ottawa, Ont.—The bill to incorporate the Buffalo and Fort Erie Public Bridge Co. with a capital of \$1,500,000 was reported by the House Committee on Private Bills recently. The bill provides for the construction of a bridge across the Niagara River between the village of Fort Erie, Ont., and Buffalo, N.Y., and is to be built as a private undertaking with the consent and supervision of the Governments of Canada and the United States. It is proposed to charge tolls on the bridge, and when these tolls have met the construction and interest charges to hand the structure over to the two Governments.

P.E.I., Province of.—Department of Public Works awarded contracts as follows for highway improvement work: Project No. 24, Alfred Cameron, South Melville, P.E.I., and George McLean, North Wiltshire, P.E.I.; project No. 25, Duncan McKenzie, French River, P.E.I., and Edward Stewart, French River, P.E.I.; project No. 26, Henry J. Phillips, Charlottetown, P.E.I., and P. G. Clark, Summerside, P.E.I.; project No. 27, Duncan McKenzie, French River, and Edward Stewart, French River; project No. 28, Duncan McKenzie, French River, and Edward Stewart, French River; project No. 30, H. M. Downing, Summerside, P.E.I.; project No. 31, H. M. Downing.

Peterboro, Ont.—Contract for completion of Provincial highway between Peterboro and Port Hope has been let to Cameron Bros. & Hutt, of Cornwall.

Peterboro, Ont.—City Council intends to construct a sidewalk on Weller St., south side, from Monaghan road to Albertus Ave., and on the south side of Wolseley St., from Benson St.

Peterboro, Ont.—City Engineer R. H. Parsons will report to Board of Works on construction of a sidewalk on the west side of Donro Armour Road, from Clifton St. to Douro St.

Pikington Tp., Ont.—Tenders will be received until 10 a.m., Friday, May 26, by George F. Cromar, Township Clerk, Elora, Ont., for the construction of a 36-ft. bridge and abutment for steel bridge. For plans and specifications apply to Township Clerk or A. W. Connor, Engineer, 34 Victoria St., Toronto.

Port Stanley, Ont.—Elgin County Council will repair the bridge. Federal Department of Public Works will be urged to construct a new bridge next year. County Engineer, James A. Bell, St. Thomas.

Quebec, Province of.—Some \$7,000,000 are to be spent in the next two years for construction, repairs and maintenance of roads in this province.

Quebec, Province of.—Tenders for the Quebec-St. Anne Highway are to be called for at once. Specifications call for macadam construction.

Quebec, Province of.—The advisability of building a bridge on the Saguenay River, at Chicoutimi, is being discussed by the Provincial Government and estimates for next Session of the Legislature are being prepared.

Quebec, Que.—Tenders will be called for the repairing and paving of certain streets in each ward. The Provincial Legislature has authorized the city to expend \$264,000 on such work, but the lists of streets to be repaired prepared by the aldermen call for an expenditure of about \$1,000,000.

Quebec, Province of.—Tenders, addressed to Amedee Dorion, Sec.-Treas., Municipality of Quebec County, until May 23, for the construction of a bridge spanning the Beauport River, and approaches of said bridge. Plans and specifications may be seen at the Department of Public Works, Quebec.

Quebec, Province of.—The good roads program of Hon. J. L. Perron, Minister of Roads, has been announced and calls for an expenditure this year of \$7,500,000. The general plan, taking Montreal as the centre, is that the highways of the Province shall stretch out to Hull, to Mont Laurier, to Lacolle, to Malone, to Sherbrooke, to Quebec and, with Levis as another centre, is the road to Jackman, Maine, the road to Sherbrooke and then to Derby Line, Vermont. Below Quebec is the long road to Rimouski and the road from Riviere du Loup to Edmundston, N. B. The money will be appropriated as follows: Regional roads, \$3,450,000; municipal works, \$2,100,000; rebuilding and upkeep, \$1,450,000; special work and administration, \$500,000.

Rovelstoke, B.C.—Tenders for bridge over Columbia River will be received by the Hon. the Minister of Public Works, Victoria, until 12 o'clock noon, Monday, June 19. (See official adv.).

Riverside, Ont.—Contract let by Town Council to Coltatti Bros. for construction of sidewalk on Lauzon Road and on the east side of St. Louis Ave.

Riverside, Ont.—Tenders were received until May 17 for construction of 1,584 ft. 3-in. wide concrete sidewalk on Lauzon Road, from Hydro R. R. South, and 1,100 ft. 4-in. concrete sidewalk on St. Louis Ave. Clerk, C. J. McHugh, Box 304, Ford, Ont.

Riviere du Loup, Que.—Ratepayers passed by-law authorizing the borrowing of \$200,000 for paving work. Work will start at once.

St. John, N.B.—Tenders for supply to Public Works Department of 1,075 lin. ft. of straight and 144 ft. circular curbing were opened by Common Council as follows, at rates per lin. ft.: Granite Street Paving and Construction Co., \$1.75 for straight, \$2.00 for circular; B. Mooney & Sons, Ltd., \$1.55 for straight, \$1.65 for circular. Referred to commissioner of works and road engineer.

St. Lambert, Que.—Following tenders were received for paving Riverside Drive; Warren Bituminous Paving Co. of Ontario, Ltd., Toronto, bitulithic pavement, at \$3.58 per yd.; Bernard Brault, Ltd., Montreal, asphaltic concrete, \$2.60 and sheet asphalt, \$3.94; Sicily Asphaltum Paving Co., Montreal, asphaltic concrete, \$3.74 and sheet asphalt, \$4.14; Quinlan Robertson & Janin, Montreal, asphaltic concrete, \$3.80, sheet asphalt, \$4.19 and bitulithic, \$4.05; Wm. I. Bishop Co., Montreal, asphaltic concrete, \$3.83 and sheet asphalt, \$4.52. Tender of Warren Bituminous Paving Co. was accepted, the total amount of the contract price being \$50,120.

Saanich, B.C.—Council accepted offer of Douglas, MacKay & Co., agents for the British Columbia Refinery Co., of Port Moody, to supply heavy road oil at 10½¢ per gallon. Council decided to construct a sidewalk in front of St. Jude's Anglican Church, on Obed and Dysart Roads.

Simcoe, Ont.—After opening tenders for concrete and Tarvia macadam roadway on the Provincial county road leading north from Simcoe, the Norfolk County Council decided to continue Tarvia macadam construction by day labor under the county road committee and County Engineer Guy R. Marston.

Simcoe, Ont.—North Townsend wants Norfolk County to take over two and a fourth miles more of their road. The residents about Port Ryerse, westerly, want an extension southward from the Vittoria turn and a new road and bridge built to cut the detour down towards Port Ryerse—a \$100,000 proposition possibly.

Stratford, Ont.—City Council intends to construct following works: (1) Excavation, concrete base, concrete combined curbs and gutters, drainage and bituminous surface, 19.3 ft. wide on Front St., extending from the North boundary of East Gore to the North boundary of Perth St., at an estimated cost of \$3,568; (2) excavation, concrete base, concrete combined curbs and gutters, drainage and bituminous surface, 19.3 ft. wide on Grant St., extending from West boundary of Downie St. to the East boundary of Home St., \$7,278; and (3) excavation, concrete base, concrete combined curbs and gutters, drainage and bituminous surface, 19.3 ft. wide on Home St., extending from South

boundary of West Gore St. to the South boundary of Grant St., \$4,429. City Clerk, W. H. Dorland.

Grant, \$1,240; painting, James Casey, \$575; plumbing and heating, Mechanical Trades Co., \$2,633; electric wiring, Canada Electric Co., \$163; local phones, Bates & McPherson, \$210. Kimberley School—Ash holst, Elevator Specialty Co., \$740; McMurich School—Ash holst, Elevator Specialty Co., \$768.

Vancouver, B.C.—A three-room addition will be constructed to Strathcona School.

Winnipeg, Man.—Tenders will be received at the office of the Winnipeg Public School Board 5 p.m., Monday, May 29, for the erection of a stone and brick fourteen-room school building on corner of Mountain Ave. and Parr St., Winnipeg. Separate tenders for plumbing, heating and ventilating will be received. For plans and specifications apply to J. B. Mitchell, Commissioner of Buildings, School Board Offices.

Woodstock, Ont.—Building operations aggregating over \$100,000 have been and will be launched during the present month, including the following: Large addition to plant of William Baird & Son, Dundas St. East; alterations and additions including new front to store of E. J. Canfield, Dundas St.; erection of new service station on Peel St., contract for which has been awarded to J. D. Tindall and Son, of this city; construction of an addition to plant of A. L. Beauregard on Peel St. south of market building; erection of large service station on Dundas St. East by A. Hastings & Son; and erection of central office for Bell Telephone Co. on Graham St.

MISCELLANEOUS

British Columbia, Province of.—Hon. John Hart, Minister of Finance, has called for tenders on an issue of \$2,000,000 bonds for irrigation and other purposes.

British Columbia, Province of.—Provincial charters have been granted to following companies: Northern Mining Properties, Ltd., Vancouver, \$417,000; North Western Dredging Co., Ltd., Vancouver, \$50,000.

Calgary, Alta.—Contract let to General Supplies, Ltd., of this city, for a 2½-ton truck chassis (Nash) with Mead-Morrison side-winch, price \$3,225 f.o.b. Calgary.

Condensed Advs.

Advertisements (not displayed) under this heading at following rates per insertion, with sixty-five cents per insertion as minimum rate in any case: "Positions Wanted," two cents per word; all other condensed advertisements, four cents per word. Payable in advance; 50 per cent. extra if charged.

GENERAL ENGINEERING AGENCY, PITTSBURGH, PA. Serving Employers everywhere overnight, require for proposals Structural Engineers, Architects, Designers, Hydro-Electric Power field and office executives and assistants, Reinforced Concrete Draftsmen, Electrical Draftsmen, Mechanical Draftsmen. —323.

"RICARDO" engines. Petrol or Paraffin, excellent for marine, commercial or stationery use. Brand new. 100 h.p. 4-cylinder, 150 h.p. & 255 h.p. 6-cylinder, 300 h.p. 12-cylinder, Thirty shillings per horse-power sterling London. Sykes, Patching, Sussex, England. —336.

POSITION WANTED: Civil Engineer with eleven years' experience in general civil work since graduation, and recently specializing in concrete, wishes to get in touch with reputable firm handling reinforced concrete work. Also fully qualified to take charge of field or office work in water power investigations. Salary \$250.00 per month. Best references, Box 50, Canadian Engineer, Toronto.

PATENT NOTICE: Any one desiring to obtain the invention covered by Canadian Patent No. 200543, granted on June 1, 1920, to Thomas Gordon Jones, of London, W. C. I., England, for Metal Seal, may do so upon application to the undersigned who are prepared to supply all reasonable demands on the part of the public for the invention, and from whom full information may be obtained. Fetherstonhaugh & Co., Ottawa, Canada. Russel S. Smart, resident. —337.

PATENT NOTICE: Any one desiring to obtain the invention covered by Canadian Patent No. 200955 granted on June 15th, 1920, to Frederick William Hall, of Westminster, S.W.1., London, England, for Coin Collecting Means for Telephone Services, may do so upon application to the undersigned who are prepared to supply all reasonable demands on the part of the public for the invention and from whom full information may be obtained. Fetherstonhaugh & Co., Ottawa, Russel S. Smart, resident. —338.

PAVEMENT TENDERS.

Sealed Tenders will be received up till noon Monday, June 5, 1922, at the office of the Town Clerk, Mimico, Ont., for Concrete and Asphalt Pavements. Plans and specifications may be seen at the office of the Engineers, Harkness London and Hertzberg, Confederation Life Building, Toronto. —334.

Exeter, Ont.—Engineer Patterson was here recently surveying for a new trunk drain on Andrew St.

Hamilton, Ont.—Plans for improving Hamilton's harbor were discussed recently by members of the Harbor Commission, Board of Control and J. M. Wilson, Engineer of Federal Department of Public Works.

Hamilton, Ont.—In the event of the plans of the Harbor Commission materializing this year, in the neighborhood of the one million dollars will be spent on waterfront development next winter. A revetment wall opposite Burlington St. will also be constructed.

Kapuskasing, Ont.—Detailed plans covering the model town which is to be built here under the supervision of the Ontario Government, have been submitted to the Legislature in a report prepared by J. A. Ellis, Director of the Bureau of Municipal Affairs.

Montreal, Que.—Tenders will be called shortly by the Shamrock Athletic Association for an addition to the grandstand at the Shamrock grounds.

Ontario, Province of.—Following are names of companies recently incorporated under Provincial charter, with head office, capitalization and name of one director: Silver Mining Co., Ltd., Cobalt, \$500,000, John Sainio; Canadian Lorrain Silver Mines, Ltd., Halleybury, 2,000,000, Edwin W. Kearney; Hanover Cement & Stone, Ltd., Hanover, \$1,500,000, Wm. S. Walton; Independent Builders, Ltd., Toronto, \$40,000, Archie B. Bennett; Lackawanna Tubes, Ltd.; Welland, \$525,000, David Ross; Toronto Junction District Orange Building Co., Ltd., Toronto, \$100,000, Timothy C. Rogers.

Ottawa, Ont.—House of Commons passed the C. P. R. bill respecting construction of branch lines in Saskatchewan and Alberta.

Ottawa, Ont.—Following are names of companies recently incorporated under Dominion charter, with head office, authorized capital and name of one director: Heath Unit Tile, Ltd., Toronto, \$50,000, Jas. W. Bicknell; Barnett-McQueen Construction Co., Ltd., Fort William, \$183,000, Otto F. Strange; Success Electric Products Co., Ltd., Ottawa, \$50,000, Wm. E. Hoare; Elbow Lake Mines Corp., Ltd., Montreal, \$3,000,000, Jos. A. Martin; British Metal Corp. (Canada) Ltd., Montreal, \$100,000, C. G. Heward; Coniagas Alkali & Reduction Co., Ltd., Thorold, \$400,000, Thos. N. Hicks; Okema Mines, Ltd., North Battleford, \$1,000,000, Albert W. Beatty.

Quebec, Que.—Following are the names of firms companies recently incorporated under Provincial charter, with head office, capitalization and name of one director: Economic Building Store (Ltd.), Montreal, \$250,000, Jos. Laureat Mascoux; Adanac Construction Co., Ltd., Montreal, \$50,000, Bernard Bourdon; Montmorency Paint Products Co., Ltd., Quebec, \$75,000, Pierre Jobidon; Safety Electric Motor Co., Joliette, \$229,000, Felix Vanasse.

Regina, Sask.—Canadian National Railways will construct a second crossing on Campbell St.

Riverside, Ont.—Town Engineer Code submitted plans and specifications to the Town Council for the removal of the Hydro-Electric suburban tracks throughout the municipality from the side of Ottawa St. to the centre of that thoroughfare, this improvement to extend for over three miles through the town.

Toronto, Ont.—Dominion Government voted \$850,000 for carrying on the work of improving the harbor here, and \$50,000 for work on the breakwater at Toronto Island.

Toronto, Ont.—A report on the proposed development of the waterfront east of Woodbine Ave. will be made at an early date by Commissioners Forman, Harris and Chambers, and Chief Engineer Cousins of the Harbor Commission.

Toronto, Ont.—General Manager H. H. Couzens of the Transportation Commission estimates the cost of making necessary changes in the transmission lines, in case it is necessary to operate the Street Railway System by Hydro power after September 1, at \$450,000.

Windsor, Ont.—T. U. Fairlie, Chief Railway Engineer

of the Hydro-Electric Commission, submitted to the Transportation Committee a plan for obviating the traffic menace on Sandwich St. East, by removing the south track and, in that way, widening the roadway to 24 ft. Proposal will be recommended to City Council for endorsement.

Winnipeg, Man.—Tenders addressed to the Chief Engineer, Canadian National Railways (Western Lines), Winnipeg, until 12 o'clock noon, Wednesday, May 31, for the following work: (1) Construction of a cast iron pipe line at Kindersley, Sask., 16,200 ft. long; (2) construction of a line revision of the Grand Trunk Pacific main line, 3.9 miles long, between Ansell and Bickerdike; (3) construction of a connection between the Canadian Northern and Grand Trunk Pacific Railways, .83 miles long, near Magnolia, Alta.; (4) construction of a connection between the Bashaw and Battle River Subdivision, 3.47 miles long, near Camrose, Alta.; and (5) construction of a connection at Ryley, 1.83 miles long, between the Viking and Battle River Sub-divisions, Canadian National Railways. Plans and specifications may be seen at the offices of the Chief Engineer, Winnipeg; District Engineer, Saskatoon; District Engineer, Edmonton; Division Engineer, Calgary; Division Engineer, Regina; Assistant Engineer, Maintenance of Way, Vancouver, and District Engineer, Prince Rupert, B.C.

RAILWAYS

Edmonton, Alta.—Supt. J. L. Jamieson of the C. P. R. announced that the company is considering the erection of a pumping plant on the south side.

Fort William Ont.—Tenders were received until May 19 for the construction of new yard at Fort William, Ont.; standard No. 4A section house, Oak Lake, Man.; and standard No. A3 station and freight shed at Niverville, Man., for Canadian Pacific Railway. District Engineer, J. C. Holden.

Montreal, Que.—Montreal Tramways Co. plans to construct a double-track line along Shakespeare Road and double-track its line on Cote des Neiges Road, north from Westmount Boulevard. Wellington St. line will be rebuilt.

North Bay, Ont.—T. & N. O. R. Railway Commission has voted \$200,000 extra expenditure to bring its tracks to

Irrigation was again the subject which engaged the attention of the members of the Edmonton Board of Trade at one of their regular weekly luncheon meetings. The meeting was in charge of the engineering and construction section of the Board of which L. E. Drummond is chairman. Addresses were given by S. G. Porter, engineer in charge of construction and maintenance of the Lethbridge section of the C.P.R. irrigation system; V. Meek, federal commissioner of Irrigation, Calgary, and G. N. Houston, secretary of the soil survey board and Irrigation council of Alberta. Mr. Porter was the main speaker and all dealt with the subject of "The Cost of Irrigation in Southern Alberta."

It is expected that operations on sections Nos. 1 and 2 of the Welland ship canal will begin soon. The Government's appropriation of \$8,000,000 to carry on this year's work on the ship canal seems to indicate that the new administration at Ottawa is anxious to get the waterway completed. It is believed section No. 9 at Thorold will be given over to a private contractor. At present the Government is operating section No. 3 with a thousand men.

As soon as the weather allows, work on a large scale will be commenced on sections one and two of the Welland Ship Canal, which contracts are in the hands of Porter Bros. At present the canal zone is very muddy, and work is being carried on with difficulty. Section three, at Thorold, is under Government contract but it is believed this section and those above Thorold will soon be let to private contractors. There is a large amount of rock excavation yet to be done on Thorold section, which is the most expensive section on the whole waterway.

The Contractor's First Choice Always

The Waterous double cylinder steam roller has been the first choice of contractors for over twenty-five years. That the confidence placed in the Waterous roller by the contractors of Canada is fully upheld is evidenced by the fact that when in need of additional rollers they insist on Waterous. This is because the Waterous roller is designed and built to earn money for its owner. Every detail of its engineering, every inch of the tested material in it, contributes directly and always to this one end.

Some years ago Wentworth County kept accurate costs of a Waterous roller and one of another make. The result showed that the Waterous roller worked in one year 202 days of 10 hours each and 76 nights, of 12 hours each. The cost of repairs was \$189.00 which was practically the total cost of repairs incurred since it was bought, and it has been in service five years.

The other make of roller was in operation 129 days of 10 hours each, and 18 nights of 12 hours each and cost \$197.00 for repairs, being in operation four seasons.

The above figures show that the Waterous roller not only did 250 per cent more work but did it at a maintenance cost of 23 percent less.

Waterous

Substructure of Edmundston-Madawaska Bridge*

International Highway Bridge of Four 232-Ft. Spans Replaces Cable Ferry Over St. John River — Piers on Well-Compacted Sand and Blue Clay Containing Boulders — Reinforcement at Pier Faces — Pontoon Construction

By G. McN. STEEVES

CONNECTING the Town of Edmundston, N.B., and the Village of Madawaska, Maine, an important new highway bridge is now being constructed across the St. John River. The highways on both sides of the river, which, at this point constitutes the international boundary, are modern and well kept, and maintain a very heavy traffic. Until the bridge is ready for crossing, the only means of transfer during the period of open water, from one system of highways to the other, is by means of a cable ferry plying a few hundred yards below the site of the bridge. During the time of making ice, and also when the latter is breaking up and running out, the crossing is interrupted for weeks at a time. When the water is low, as was the case during the past summer, constituting a record, there is current barely sufficient to operate the ferry. Thus the conditions noted seriously affect traffic at this point.

Edmundston is a growing town of approximately 5,000 people. It serves a large outlying agricultural and lumbering district on both sides of the river. Madawaska is a rural community depending on Edmundston for immediate physical needs and professional services.

The nearest all the year crossing is between St. Leonard's, N.B., and Van Buren, Me., 26 miles below this bridge, while on the upper side, there is no crossing excepting a foot bridge between Clair, N.B., and Fort Kent, Me., some 20 miles west. Means to improve the lack of facilities thus

awarded in February, 1921, for the carrying out of the work.

Governing Layout Conditions.

Features to be mainly considered in the choice of the actual site were two in number: (1) Elimination of railway grade crossings, and (2) Safe clearance above high water.

FIG. 2—COMPLETED WORK—CANADIAN ABUTMENT IN FOREGROUND

Two lines of railway, the Transcontinental and Temiscouata, pass through Edmundston, skirting the river bank at an elevation approximately 3 ft. above the level of the highest water recorded. The road leading to the ferry crossing passes under the Transcontinental tracks, so, therefore, this site could not be used without the introduction of a level crossing. To satisfy both above conditions, it was necessary to build the structure over the railway lines.

The clearance required between the top of rail and the under side of any overhead structure is nearly 23 ft. A suitable location which would provide approaches to a structure of these requirements was available at the extension of a reserved street in the town, and its prolongation across the river, where the top of the bank was about the same elevation as that on the Canadian side.

In passing, reference is made to the fore-sight of an early resident of the town of Edmundston, who, at the time of the high water of 1885, the highest level recorded, marked on a large boulder the water line at that time, and authenticated it with the legend inscribed on the rock: "Water came to here April, 1885."

The bank on the Canadian side is ledge rock, overlain with pockets of clay. The American bank is gravel, very compact, with an 8 ft. layer of clay overburden. The river

FIG. 1—VIEW FROM MAINE SHORE, SEPT. 29, 1921

endured by residents of the district, had been under consideration of the Governments of Canada and of the State of Maine for some years. The war interfered with the carrying out of a bridge project earlier than 1920. In that year tenders were called for, and a contract was

*Paper presented to the St. John Branch, Engineering Institute of Canada.

bed is composed of coarse gravel and boulders, varying from a foot to 3 ft. in thickness, overlying very hard sand and blue clay, mixed.

During high water periods, the current over the full width is swift, probably 8 miles per hour, but, owing to the sharp gradient, floods soon run off. During low water, the current is reduced to about 3 miles per hour, and is

FIG. 3—CONCRETING PIER NO. 2—PANEL FORMS READY FOR SPOUTING

confined within a channel about 200 ft. wide, adjacent to the Canadian shore, the balance of the river being comparatively slack water. The width of the river at high water is about 850 ft. and at low water 200 ft. less. At low water the depth varies from 2 to 7 ft. at this crossing. All elevations are referred to mean sea level. Low water is elevation 441.85, and high water, the elevation of the boulder referred to, is 467.85.

Description of Structure.

The bridge is being built under two separate contracts, one covering the foundation work or substructure, and the other the steel superstructure. The first of the foregoing will be dealt with at this time.

Piers.

The substructure consists of two concrete abutments and three semi-reinforced concrete piers, as shown in Figs. 1 and 2. The distance between face of ballast walls of each abutment and the centre of next adjacent pier is 235 ft., 6 in., which is also the distance between piers.

Each pier rests on a footing course of varying depth in the case of each, the maximum being 10 ft. under pier 2. This footing course is built inside a sheet pile cofferdam, which in turn is enclosed within a cribwork protection and stone rip-rap. The top of footing course is elevation 442.0, or 0.15 above extreme low water.

The main body of the piers is rectangular in plan, with a triangular shaped cutwater on the up-stream end, and a triangular shaped buttress on the down-stream end, as shown in Figs. 3 and 4. The nose of the cutwater is protected by an 8 by 8 by $\frac{3}{4}$ -in. steel angle. The piers are 8 ft. 6 in. by 29 ft. at the top and 58.54 ft. high above the top of the footing course. The sides are battered 1 in 20.

The average elevation of river bed is 438.0. The footing course was required to extend at least 6 ft. below river bed. A suitable bearing was obtained at this minimum in the case of the two shore piers. A mattress of steel reinforcement of 1 in. square twisted rods was placed

within a foot, or as near that as possible, of the bottom of the concrete of the footing course. The rods were spaced 12 in. in each direction. Vertical rods, at 12-in. centres, of the same dimensions were hooked into this mattress, and carried near the faces of the piers, as construction proceeded, to within a few feet of the top of the pier. Horizontal $\frac{3}{4}$ -in. square twisted reinforcing at 2 ft. centres was carried up with the verticals. Splices and intersections were wired with No. 16 gauge Bates wire ties.

Abutments.

The Canadian abutment rests on solid rock. It is a type of "U" abutment, somewhat out of the ordinary in the design of the walls. The centre line between trusses of the superstructure is eccentric downstream to the centre line of the abutment, to permit the foot walk to be carried on the inside of the upstream wing wall. This accounts for a buttress on the lower side of the abutment. The sidewalk on the superstructure is to be cantilevered from the truss. Reinforcing bars of 1 in. square twisted steel were placed in the inside corners at the junction of the main wall with the wings. These were 12 ft. long and bent in the centre to a right angle.

The foundation for the American abutment is fine compact gravel, with 8 to 10 ft. of clay overburden. Owing to the presence of water at several points in the bank, adjacent to the site of the abutment, but not in the immediate vicinity, the original plans called for a pile foundation with an elaborate arrangement of batter piles to be driven. The carrying out of the original plan was attempted, but amounted to the driving of only one pile a distance of $4\frac{1}{2}$ ft. under a 2,400-lb. hammer. The design was altered and the former level of excavation for footing course was lowered 5 ft., resulting in placing the foundations well inside the bank. Over the bottom of the exca-

FIG. 4—CONCRETING PIER NO. 1—ONE ELEVATING CAGE AT CONCRETING LEVEL, OTHER AT GROUND

vation was placed a 3-in. layer of 1:3 grout, slightly worked into the bed to bond the same before placing the footing course.

Both abutments carry on the copings reinforced posts and pre-cast re-inforced rails, as shown in Fig. 1. This part of the work was done during cold weather. Aggre-

A series of tests in the meantime was being carried out by the engineers, with the different proportions of run of bank gravel, and re-mixed screened gravel. Cubes and cylinder test samples were submitted to the testing laboratories of the Department of Public Works, Ottawa, and the University of Maine, the results from both invariably being similar in the case of each set of samples tested. The results went to show that the stronger concrete was obtained from the natural run of bank gravel; in one or two cases, samples of the latter aggregate showed double the compressive strength of the re-mixed screened gravel. Screening was therefore ordered discontinued, after 200 cu. yds. of screened gravel concrete had been deposited.

Sequence of Operations, Pier No. 2.

The centre of the pier for placing protection cribs was obtained by direct chainage from shore. A 300-ft. tape was used, supported on gas-pipe standards driven into the bed of the river, and carrying on the top a "U" made up of tees and ells. The side lines of cribs were set with a box sextant.

Each protection cribwork consisted of four separate cribs: (1) Nose piece 46 ft. 10 in. across the base, and 23 ft. 2 in. perpendicular distance to the apex; (2) Two side cribs, 62 ft. 10 in. long and 9 ft. 0 in. wide; (3) One closure crib 46 ft. 10 in. by 9 ft. 0 in., extending across the down stream ends of the last two cribs and the enclosed space between them. The cribs were built of 8 in. to 10 in. logs in 8 ft. bays. Ballast floors were provided. When completed and finally in place, the cribs were to

FIG. 7.—FOURTH LIFT (20 FT.) OF PANEL FORMS, PIER NO. 1—PREVIOUS TO PLACING SLIDING HOPPERS ON TOWER

stand 2 ft. above low water. The maximum height built was 8 ft. When finally in place, the cribs were filled with stone and clay, and banked on the outside with clay, the latter to assist in making watertight the cofferdam subsequently to be built inside. The centre line of the pier was now accurately set by triangulation, and checked by chainage. From these the lines to which the cofferdam was to be built were laid on the cribwork. The cofferdam was also the form work for the foundation course.

Sheet Piling.

The cofferdam consisted of sheet piling built up of two 2 by 8 in. planks, half lapped, spiked together; preparatory to driving, the piling was stood on end around a frame composed of timbers varying in size from 6 by 8 in. to 12 by 12 in., according to the depth it was anticipated the piling would be driven. From the character of the material of the river bed, it was reasonably certain that the sheeting would not stand hard driving. A power hammer was therefore not installed.

Up to this point, the conditions obtaining in all three pier sites were similar. From borings made on this pier site, it was found that the material to be excavated contained more sand, and the hard stratum on which the footing course was to rest, was 4 ft. deeper than at the other

piers. Timbers 12 by 12 in. were used in the framework for this cofferdam.

The water inside the protection crib was 4 ft. deep. The river bed was roughly levelled off, and a frame was built, the outside dimensions of which corresponded to the dimensions of the footing course. This was centred and held in position. Short posts about 4 ft. long were stood up on the first frame, and a second frame was constructed on the top of these posts. This double frame was weighted and sunk. The sheeting was then placed around the four sides of the framework. Clay puddle was next placed in the 6-ft. space between the outside of the cofferdam and the crib protection, to a height of 2 ft. above the water level. The water was then pumped out to permit of excavation. This was done by hand, the material loaded into skips, and dumped outside the cribwork. The material was too hard to be dug with a clam shell. As the bottom was lowered the sheeting was driven with large wooden mauls. Great care had to be exercised in driving not to broom the pointed ends of the sheeting. The driving followed closely the hand picking at the foot of each pile.

As the excavation was lowered, additional frames were set in under the first two. Cross timbers were jacked into prevent the sheeting crowding, a tendency that was ever present owing to the large number of boulders that had to be removed away from the cutting edge. These had to be broken up, causing a disturbance of the bed, outside of the sheeting, which increased the leakage to such an extent that eventually two centrifugal suction pumps, one 6 in. and one 8 in. were required to keep the water down to the level at which excavation could be carried on.

In other piers, it had been possible to have the caisson dry enough to concrete up to a set of walings, remove these and proceed with the concrete. In the present case, this was not possible, because of the leaks, and the foundation course was deposited under water to a depth of 5 ft. above which the amount of leakage was negligible.

The timber wales and braces were replaced by S0-lb. rails and left in the concrete.

Concrete was deposited under water by means of bottom dump buckets. After 4 days, the water was pumped off, the surface thoroughly broomed, the reinforcing steel mattress laid, and concreting resumed to top of footing course.

Forms.

Wooden panel forms, of the type illustrated in Figs. 6 and 7, were employed. Specials were re-used on all piers in a corresponding position three times. The regular rectangular form was used over and over again, as often as required. Form lumber was 1½ in. T. & G. clear spruce, fastened to 3 by 5 in. framework. The height of the sections was 5 ft., which gave a batter of 3 in. in each lift. The forms were laid out and built on a specially constructed platform, where the outline of the horizontal plane through the pier at each succeeding 5 ft. lift could be accurately laid out. When placed on the pier, the forms fitted perfectly. Check levels for the bridge seat differed from the elevation of the forms by not more than ¼ in.

Forms were tied together with two wire ties to each bolt, projecting through the forms. These ties were previously prepared on Newburgh's wire tie machine. Any slack was taken up by twisting the bolt head against a wrench held on the nut. After the concrete had set four or five hours, the head was broken by giving the bolt a backward turn.

The forms were left on for three days. To remove them, the bolts holding the wire ties were backed out, then the bolts holding adjacent sections were taken out. A sling attached to the fall of the tower derrick was hooked into the upper waling of the form section, which was then wedged off at the bottom, and the form was raised to the next lift, or lowered to the ground as required.

Conclusion.

Tongued and grooved lumber did not prove entirely satisfactory. The dampness in the concrete caused the

tongue to swell, and pushed the inner side of the groove into the concrete. With forms new, this was more marked than after they had been used several times. Before being re-used, forms were planed and oiled. Lumber dressed on three sides was used for forms on the abutments, and proved entirely satisfactory.

The concrete used in the bridge seats and copings was mixed in the proportion of 1:2:4. For the rest of the work it was 1:3:5, except for sidewalks and railings, for which it was 1:3 mortar.

Twenty-nine carloads of cement, 150,000 lb. of steel reinforcing, and over 5,000 cu. yd. of gravel were used in the job.

Work was started May 10, and completed Nov. 26, 1921. The date of completion set by the contract was Feb. 20, 1922. The maximum number of men employed at one time was 120.

The contractors were D. C. Burpee & Son, Devon, N. B., with whom the writer was associated. S. J. Chapleau, was engineer-in-charge for the Department of Public Works (Canada), and had L. DeB. Roy, assistant engineer, as his representative on the work. L. N. Edwards represented the Maine State Highway Commission, his deputy on the work being H. E. Towne. A. W. Gregory, of the Department of Public Works, represented both governments as inspector of materials.

CANADIAN WATER-POWERS.

CANADA is richly endowed with water-power resources. Practically every large industrial centre throughout the Dominion is now served with hydro-electric energy and has within easy transmission distance ample reserves of water-power. Over 90 per cent of the prime motive power of the central electric station industry of Canada is hydro power.

The administration of the water resources of the Dominion is a divided federal and provincial responsibility. In Alberta, Saskatchewan, Manitoba, and the Yukon and Northwest Territories, control is vested in the Dominion Water Power Branch, Department of the Interior. Throughout the remainder of Canada, administration is carried out by the following respective provincial authorities: British Columbia, Department of Lands; Ontario, Department of Lands and Forests; Quebec, Department of Land and Forests; Nova Scotia, Commissioner of Public Works and Mines; New Brunswick, Department of Lands and Mines; Prince Edward Island, Commissioner of Public Works.

In Manitoba, Ontario, New Brunswick and Nova Scotia, commissions under the Government have been formed to develop or purchase power and to transmit and distribute electric energy. The greatest development in this field has been in Ontario through the Hydro-Electric Power Commission, formed in 1905. In general, the commission acts as administrator for municipalities undertaking to co-operatively purchase or develop electric energy; it also acts as trustee for the Provincial Government, the financing of the enterprises being backed by the Government. In 1919 the commission was delivering power to 217 municipalities and was operating in all fourteen power plants, developing a total of 284,449 h.p. The Manitoba and Nova Scotia Power Commissions, formed in 1919, and the New Brunswick Electric Power Commission in 1920, have much the same functions as the Hydro-Electric Power Commission of Ontario. In Manitoba the commission purchases power from the city of Winnipeg and transmits it to Portage la Prairie and other towns in the southern part of the province. In New Brunswick and Nova Scotia the commissions are engaged in the development of hydro-electric powers which will serve in the near future the cities of St. John, N.B., and Halifax, N.S. In the province of Quebec there is no Government commission engaged in the production or distribution of electric energy. The Quebec Streams Commission is, however, actively engaged in the examination of rivers and power sites and the construction of storage basins for water-power purposes.

The water-wheels installed throughout the Dominion total 2,470,580 h.p. A detailed analysis of the relationship between this installed power, taking into consideration local pondage and load factors, and the corresponding available water-power, indicates that the at present recorded available water-powers of the Dominion will permit of a turbine installation of 41,700,000 h.p. In other words, the present turbine installation represents only 5.9 per cent utilization of the present recorded water-power resources. In support of this statement it may be said that the detailed analysis made of the water-power resources of the provinces of New Brunswick and Nova Scotia have disclosed most advantageous reservoir and pondage facilities for regulating stream flow, and it is estimated that, allowing for the diversity factor between installed power and consumers' demands, the two provinces possess respectively 200,000 and 300,000 commercial h.p. as against the lower figures given in the table.

With a water-power development of 275 h.p. per 1,000 population, Canada stands well to the fore in respect to availability and utilization of hydro-power resources, being surpassed on this basis by Norway alone. The enormous water-power reserves still untouched form a substantial foundation for the progressive exploitation and development of other natural resources, especially if properly co-ordinated with the development and utilization of the well-known fuel resources of the Dominion.

APPROPRIATIONS FOR NATIONAL RAILWAYS.

APPROPRIATIONS to meet requirements of the National railways, amounting to more than \$90,000,000, were approved in rapid succession after some hours' discussion in committee of supply in the House of Commons recently. The appropriations approved were as follows: \$42,800,000 to meet operating deficits, to pay for property, materials and supplies, to meet interest and sinking funds on notes, securities or obligations, principal and interest or maturing or matured loans, construction and betterments, co-ordination or consolidation of railway lines and facilities on the Canadian Northern system. \$25,750,000 for like purposes on the Grand Trunk Railway system; \$15,900,000 for like use in connection with the Grand Trunk Pacific railway; \$2,800,000 to be advanced for the purchase of repair of equipment for the Canadian Northern and Grand Trunk Pacific; \$2,700,000 for construction and betterments on the Canadian government railways, that is, the Intercolonial and Prince Edward Island railways and the National Transcontinental railway as branch lines for the Intercolonial: \$40,000 for and Moncton railway and the Caraquet and Gulf Shore railway as branch lines for the Intercolonial: \$40,000 for maintenance of the Hudson Bay railway terminals at Port Nelson; \$30,000 to pay claims for right of way on the Canadian government railways—a total of \$90,170,000.

The Canadian Western Natural Gas, Light, Heat and Power Co., has acquired outright a big block of natural gas rights, embracing the most important holdings in the Redcliffe field, near Medicine Hat, Alta., which will guarantee even more than an adequate supply of gas for Calgary. It is planned to get this gas into the main line now supplying Calgary, by means of an extension of the pipe line from the present terminus of the Bow Island pipe line to the Redcliffe field, a distance of 38 miles.

A few months ago a branch of the Engineering Institute of Canada was organized in Lethbridge, Alta., and has proved very successful. At present there are over sixty members and affiliates attached to the branch. C. M. Arnold, assistant chief engineer of the Lethbridge Northern Irrigation District, is chairman, and G. S. Brown, assistant engineer in the C.P.R. Department of Natural Resources at Lethbridge, is secretary.

TOPOGRAPHICAL SURVEY OF LONDON, ONT.*

Triangulation Net Containing Four Stations of Primary
Triangulation of Canada — Precise Level Net Con-
tains 41 Miles of Line — Method of Marking
Stations and Bench Marks.

By Douglas H. Nelles,

Supervisor of Topography, Geodetic Survey of Canada.

TOPOGRAPHICAL surveying of a city consists of six, more or less, distinct operations: precise level net, secondary level net, triangulation net, traverse net, the measuring in the natural and artificial features to be shown on the map, and the locating of the contours showing the modeling or configuration of the ground surface.

The triangulation net is surveyed by engineers from the triangulation division of the Geodetic Survey, who work in close co-operation with the engineer in charge of the topographical division, especially during the reconnaissance work in locating stations. The main object of the triangulation is to control the traverse net, and stations are placed as nearly as possible a mile apart along the main traverse lines. The London net consists of thirteen stations from which observations were made and eight intersection stations as shown in Fig. 1. Four of these stations form a quadrilateral of the primary triangulation of Canada. The remaining stations were established during the season and are placed so as to form a precise control for all lineal measurements of the survey. The net was adjusted by the co-ordinate method of adjustment. A more detailed account of this operation by the engineer in charge will be found below.

The precise level net is surveyed by engineers from the levelling division of the Survey, who also work in close co-operation with the engineer from the topographical division. The object of a precise level net is to establish a large number of permanent bench-marks around and through the city, of a high degree of precision, which while giving elevations themselves for any engineering work in their immediate vicinity, also serve to control lines of secondary levelling.

The word permanent above is used in a relative sense, as in establishing the permanency of any structure the economic factor of the cost of construction has always to be taken into consideration. If a copper bolt had been cemented into the floor of the King room in the Grand Pyramid at Ghizeh in Egypt and its elevation established, it would probably be intact today, but the probability is that in 25,000 years from now all the present bench-marks in London will have disappeared.

Precise Level Net

The precise level net of London consists of forty-one miles of line, which is composed of a line making a complete circuit of the city. The city is further divided into sections by four east and west cross lines and five north and south cross lines. The cross lines start from and close on the circuit line or themselves. The whole net has been

adjusted by least squares and the most probable values assigned to the various bench-marks. The closing error per mile of line was 0.0025 ft., and the average closing error of line between bench-marks is 0.001. Ninety-five permanent bench-marks were built and their elevations established. Fourteen of these called class "A," consisted of a concrete pier 6 ft. 6 in. long set in the ground with 6 in. above the surface in the top of which was set a 3/4-in. copper bolt to hold the elevation. Fifty-one bench-marks, class "B," consisted of a 2-in. galvanized iron pipe 6 ft. long, the bottom of which was split and spread so as to prevent vertical movement. The bottom of the bench-mark was placed 5 ft. 6 in. below the surface and concrete a few inches in depth, was placed in the bottom of the hole further to prevent vertical movement. Thirty bench-marks consisted of a copper bolt set vertically in concrete sidewalks, bridge or culvert abutments and horizontally in foundations of buildings, class "C" and "D". Further information in regard to the precise level net will be found below, and in Fig. 2.

The following is abstracted from the summary report of F. P. Steers, the geodetic engineer in charge of the topographical survey of London.

Report of Geodetic Engineer.

A system of precise traverses has been laid out for the city. These are divided by name into two classes, but the methods of survey are of about the same accuracy. The main traverse lines start from and close on triangulation stations between which the stations and controlled lines are adjusted. The secondary traverse lines start from and close on an adjusted station of the main traverse.

The traverse net is so designed that the main lines are about half a mile apart and run along the streets along which the long side of the block lies. The secondary traverse lines run along the streets which

FIG. 1—TRIANGULATION NET, LONDON, ONT.

present the shortest side of the block. This placing of the lines while it gives the same number of angles to be measured, gives the shortest length of line and so decreases the cost of measurement. The system leaves one station at one corner of each street intersection, which is marked by a 1/2-in. copper bolt cemented into the sidewalk. This bolt besides constituting a distance co-ordinate, becomes a bench

*From the last annual report of the Superintendent, Geodetic Survey of Canada.

mark of an accuracy good enough for all ordinary needs of city engineering.

The traverses surveyed during the 1920 season comprise 12.5 miles of line, containing 124 stations or about 10 stations per mile; besides this 33 bolts were placed in position. The position of these lines takes in the most thickly built-up section of the city around Dundas and Richmond streets.

All distances as shown in the geographical position list of the triangulation are mean sea-level distances. All the chained measurements taken in London are at an average elevation of 280 ft. above mean sea-level, so that a distance of 5,000 ft. at mean sea-level on being projected to an elevation of 820 ft. would increase to 5000.196 ft. As errors of our traverses will be much smaller than this, the datum of the lineal measurements of London have been placed at 820 ft. above mean sea-level.

The mathematical co-ordinates of the survey will be rectangular. Holeproof triangulation station has been chosen as the zero of the co-ordinates and as the city engineer desires to have the edges of the map sheets parallel to the street lines, the datum line for the co-ordinates will be a line passing through Holeproof station parallel to Waterloo street line, or nearly so. All the bearings of the survey will be referred to this line. All the distances and bearings of the triangulation have been re-calculated on the above datums and the positions of the triangulation stations are being listed by rectangular latitude and departure co-ordinates in the same manner as the traverse stations.

Secondary Levels.

Secondary levels are run over all traverse lines and start from and end on an adjusted bench-mark. They serve four purposes; (1) to establish the elevation of all traverse bolts and thus render them permanent bench-marks; (2) to establish the elevations of such extra bench-marks at the city engineer desires to put in, these generally being of the shelf design, class "E;" (3), to obtain the elevation of the points along the traverse lines where the grade changes, thus giving information for chainage correction for grade; (4), to obtain spot levels to help out in the work of fixing the location of contours. Fourteen miles of secondary levels was run during the season, establishing the elevation of 168 permanent bench-marks, consisting of 145 traverse station bolts and 23 bench-marks, class "E." The average closing per mile of line came to 0.016 ft., which is an average closing of line between bench-marks of 0.0013 ft. The elevation of the secondary bench-marks resulting from the adjustment of the secondary level net, should be of a high degree of accuracy.

Mapping details consist of hydrants, manholes, drainage grates, fences, sidewalks, buildings, etc., being all the natural and artificial features to be shown on the map. The part chosen for the last season's work was the most congested in the city and therefore the most expensive to measure up. In this business district an engineer and two assistants averaged nine acres a day. In a residential district the average would be much higher and in open country like that in the vicinity of the asylum the average would

be around thirty acres; this would include the contours as well.

During the winter experiments have been carried on which seem to show that the details of the interior of residential city blocks can be obtained from aerial photographs with sufficient accuracy to be within the scale of the map.

FIG. 2—LEVEL NET, LONDON, ONT.

The Air Board has consented to take aerial pictures of London for the Geodetic Survey, as an experiment to see what can be done in this regard. With this information it is also intended to see how accurate a photographic mosaic of the city can be made on the same scale as the map scale.

QUEBEC ENGINEERS MEET.

AN interesting address was delivered at a meeting of the Quebec branch of the Engineering Institute of Canada held on May 23, by Alexandre Larivière, engineer of the Public Service Commission, Quebec. Mr. Larivière described the water powers in the province of Quebec and their value to industry. He described in detail the construction of the transmission lines in the province and referred to the high voltages carried from Shawinigan Falls. He said all this scientific progress which has led to wonderful results, and which is important from an economic point of view, is the fruit of the work of engineers belonging to different companies. Before them each day problems always more complex arise but they face them bravely and overcome by degrees the obstacles that arise in the operation of wires of a different kind, especially electric wires. Development in all branches of electrical genius is rapid and constant, but we are still far from the day when lines can be constructed which will be operated at 500,000 volts. In 1921 a line of 220,000 volts was built.

Announcement that the State Department at Washington has intimated to the Dominion Government its willingness to open negotiations on the St. Lawrence waterways scheme will, it is expected, bring the whole subject before the House again. On several occasions this session the House of Commons has discussed the St. Lawrence waterways scheme but without a final expression of opinion by the House, the debate on each occasion being adjourned.

FIRE PREVENTION AND PROTECTION IN MUNICIPALITIES*

Serious Increase in Fire Losses — Water Works Department Can Help by Supplying Adequate Protection — Details of Campaign in Indianapolis.

By Frank C. Jordan,
Secretary, Indianapolis Water Co.

FIRE loss in America has reached the proportions of a national calamity and we are becoming a criminally careless people. The burning of four or five hundred million dollars worth of property every year has ceased to be a matter of no concern. The increasing fire loss stands as a serious indictment of the American public. The 1921 fire loss means that five hundred million dollars worth of our natural and created resources are wiped out of existence. There is a prevailing opinion that fire insurance companies in some mysterious way make good our loss by fire. The proceeds of a fire insurance policy may reimburse the individual for the loss he has sustained but no amount of money can restore a burned structure, therefore, when a fire occurs everybody loses.

During the World War, we were very bitter in our denunciation of the German nation by reason of the wanton destruction of thousands and thousands of acres of French forests by the German army, and our papers gave picture after picture depicting the burned and damaged forests, and we took a vow that Germany must be made to pay for this damage. In the year 1921, American forests were burned equal in acreage to eight times the total acreage destroyed or damaged in France during the four years of the World War, and 75 per cent of all of our 1921 forest fires were due to human agencies and could have been prevented by care and vigilance on the part of forest users. Sufficient timber was burned in American forests last year to build 5-room houses for the entire population of such cities as Kansas City, New Orleans, Washington, Seattle, Portland, Rochester or Indianapolis. America's fire loss during the year 1921 exceeded five hundred million dollars, this amount covering insurable property only and not including loss of forests, standing grain, pasture lands etc. H. A. Smith, president of the National Fire Insurance Co., of Hartford, states in an article which appeared in the New York Journal of Commerce, that disbursements by the insurance companies during 1920 covering losses and operating expenses exceeded the losses and expenses for any other year in the history of our country with the exception of the year 1917. These figures also show that the amount paid out by the insurance companies in the year 1906, the year of the San Francisco fire, totaled \$359,642,372, and we well remember that the fire loss for that year was a serious shock to many of our great financial institutions and that it caused great concern all over our country. The losses and expenses for the year 1920 exceeded the 1906 insurance figures by one hundred and five million dollars, and generally speaking the public concerned itself very little about the matter.

Fire Losses Increase.

A comparison for the fire losses for the years 1906 and 1920 gives us an interesting slant on the workings of the public mind. The actual fire loss on created property in 1906 was \$159,710,000, an amount \$129,000,000 greater than the loss on created and insured property in 1920. Much of the San Francisco property carried little or no insurance, the insurance companies paying out only \$359,000,000 during the year 1906. The public, therefore, had first hand knowledge of the terrible ravages of fire and great was the clamor for fire prevention. This enthusiasm wore off in a short time and the public apparently contented itself by covering its property with an insurance policy and forthwith passed the burden of worry to the insurance

companies. In 1920, with a fire loss of \$330,000,000 on created and insured property, the insurance companies paid out \$464,000,000 covering fire loss and operating expenses. Having thus passed the burden to the insurance companies, and having only second hand information in regard to the ravages of fire the public did not greatly concern itself.

A careful survey seems to indicate that the only answer which our country makes to this ever increasing fire loss is to add largely to its insurance premiums and to its fire departments both in men and equipment and today our fire departments are recognized as the most efficient in the world and well they need be. American travellers to foreign lands are prone to make rather uncomplimentary and facetious remarks in regard to the antiquated fire fighting equipment maintained by the European cities, entirely overlooking the fact that while we have been busily engaged in increasing the efficiency of our fire fighting equipment the American public has been ever more busily engaged in increasing its careless habits. We are today confronted with the lamentable fact that our country, with all its wonderful development and wonderful fire fighting force and equipment, has an annual fire loss of almost \$5.00 per capita whereas the foreign countries, with antiquated fire fighting equipment but with careful habits reinforced by severe personal liability laws, have an annual per capita fire loss ranging from 11 to 60 cents.

The depletion of our resources by fire is in itself an exceedingly serious matter, but the seriousness of the financial loss is greatly exceeded by the seriousness of the loss of life due to fire, our 1920 figures showing that 15,219 persons were burned to death in the United States and 17,641 were seriously injured. 82 per cent of the dead and injured were mothers and children, and 92 per cent of the fires that caused these fatalities were the result of carelessness or negligence. Carefully prepared statistics indicate that approximately 80 per cent. of all the fires occurring in the United States are preventable.

Appeal to Water Works Association.

In view of our appalling loss of life and property, it is imperative that all great organizations, such as the American Water Works Association, give most careful attention to the question of fire protection and fire prevention and exert every effort to bring about the elimination of all of those fires which are classed as preventable. It is high time that we turn the spotlight of publicity on our fire loss, make a careful study of the causes of our fires and map out a carefully prepared campaign of education to the end that the right thinking people of this country may understand the seriousness of our fire loss and take proper steps to cut this loss to a minimum figure. This campaign of education should be followed by the enactment of rigid laws covering personal liability for preventable fires, and these laws should be enforced to the letter so that the irresponsible or evil-minded citizen will be compelled to eliminate preventable fires.

In many foreign countries, a man who has a fire must prove to the court that he was in no way responsible or he is subjected to a fine and the loss of his insurance. The time must come when the United States will enact laws covering personal liability for preventable fires. The public conscience has become dulled to the necessity for any fire prevention measures. We feel relieved when we read the words "Fully covered by insurance," and we feel that some soul-less corporation called an insurance company will shake a tree bearing a never ending crop of dollars and gather up this money and hand it to the insured, fully compensating him for all loss. We overlook the fact that our tremendous fire loss, plus the cost of operating insurance companies, is borne by all of us in the way of insurance premiums and that this amount constitutes one of our greatest national expenditures.

A few years ago the average insurance agent took very little interest in the subject of fire prevention, the fact of an increase in fire loss being used by him as an argument to his clients to take out more insurance. The progressive insurance agents of today, however, take a different view

*Paper presented at the Annual Convention of the American Water Works Association, Philadelphia, May 15-19,

of the matter, and president F. J. Fox of the National Association of Insurance Agents gives voice to the following statement: "Although it may seem to the shortsighted agent poor business to recommend to an insured that if a certain pile of rubbish is disposed of, the rate can be reduced from \$1.25 to 13 cents, as a matter of fact such advice is a part of the duty every agent owes to his clients even though such advice may reduce the actual premium rate involved." He further states that: "It is a notable fact that the press of the country has been active in aiding communities to reduce their fire losses, and it is absolutely essential that reputable agents throughout the country co-operate with every ounce of energy to the same end." No organization in the United States should be more interested in the subject of fire protection and fire prevention than the American Water Works Association, and I sincerely trust that this Association will at once go on record, pledging its unqualified support to any movement looking to the curtailing of our fire loss. I desire to speak a word in commendation of the fine service which is being rendered by the National Fire Protection Association, and to extend your support of that organization. Through the distribution of carefully prepared literature, and the putting forth of unstinted efforts in the cause of fire prevention, it is rendering a nation-wide service, the value of which cannot be measured in dollars and cents. I should be glad to see our Association affiliate with the N. F. P. A., and it seems to me that it would be wise for our Association to urge all of its members to join the N. F. P. A. and co-operate with it in every way in the great campaign of fire prevention.

Adequate Fire Protection Essential.

If the fire prevention program is to be successful, it will be due in no small measure to the co-operation on the part of the water plant superintendent, and his first duty will be to see that his property is fully equipped to furnish adequate fire protection service. This may require the expenditure of a considerable amount of money, but the value of the adequate fire protection service will far outweigh the fixed charges on the extensions and additions necessary to bring the plant up to a point where it can furnish excellent service. The Committee on Fire Prevention and Engineering Standards of the National Board of Fire Underwriters of New York has made a large number of reports on the water departments of the country, and if their suggestions are carried out these water departments would be in position to furnish excellent service and we would to the fullest extent co-operate in the fire prevention program. During the past fifteen years, the National Board of Fire Underwriters has made several reports on the Indianapolis Water Co's property, and we have found these reports exceedingly valuable in that they have pointed out our weak spots and have guided us in mapping out our future extensions and additions. Our company is making a conscientious effort to comply with all of their suggestions, and it is our opinion that the increased efficiency of our water service has justified our expenditures. On a number of occasions they have modified some of their requests or requirements after getting our viewpoint, and in all of our dealings with the representatives of this organization, we have found them broad-minded and fair. I trust that there may be the finest spirit of co-operation between all of our members and the National Board of Fire Underwriters, to the end that the water plants over the United States may furnish a thoroughly satisfactory fire protection service. A high fire loss in a city raises a question as to the integrity of the water plant to the same degree that a high typhoid rate raises a question in the minds of the people as to the purity of the water supply. These assumptions on the part of the public are not entirely true but nevertheless they exist in the minds of many of our citizens. Years of patient effort have largely eliminated typhoid fever, and the same patient effort will eliminate our preventable fires.

Campaign in Indianapolis.

The up-to-date waterworks official made every effort to eliminate typhoid, and he should work just as hard to-

ward the elimination of preventable fires. If a fire prevention campaign has been inaugurated in his city, he should co-operate with it; if none has been inaugurated, he should initiate one and do his utmost to carry it through to a successful conclusion. Acting on this assumption, and on the invitation of W. J. Curran of the Indianapolis Salvage Corps, and E. M. Sellers, Manager of the Indiana Inspection Bureau, the writer suggested to the Indianapolis Chamber of Commerce the formation of a Fire Prevention Committee. This was done in the early part of April, 1921, and the writer was made Chairman of a Fire Prevention Committee consisting of about 1,200 Indianapolis citizens. At the outset, we made a most careful study of our fire loss and were amazed to find that it had increased from a per capita loss of \$1.75 in 1910 to a per capita loss of \$5.10 for the year 1920, and that the average Indianapolis citizen had increased his careless habits in a greater ratio than the city had been able to increase its fire fighting facilities. Our investigation showed that in the year 1910 our city had 5.8 fires per thousand population, and that this had increased to 10.7 fires per thousand population during the year 1920. After going into the matter with great care, we determined that this great fire loss could not be checked by any campaign of one week or one month's duration, and when our campaign was launched we went into it determined to spend four or five years if necessary to achieve the results for which we were working, namely, a cleaner and healthier Indianapolis with an exceptionally low fire loss.

Value of Co-operation.

We realized that the success of our undertaking depended almost entirely upon the one word "Co-operation," and we have received as fine a spirit of co-operation as has ever been accorded to any city-wide undertaking in the city of Indianapolis. At the outset of the 1921 campaign, the city evidenced its interest by defraying the expenses of the fire prevention campaign, and during the 1921 campaign, and the same will be true of the 1922 campaign. Not one dollar has been put up by anyone who might in any way be interested from an ulterior motive. The fire department, and in fact all city departments, have co-operated in an exceptionally fine way and have done their utmost in the cause of fire prevention. No finer service has been rendered by any one than that rendered by the public and parochial schools, and a large measure of the success of our campaign has been due to the exceptionally fine co-operation accorded by these organizations.

We are arranging to conduct a City Beautification Campaign on the theory that if we can replace a rubbish pile with a flower bed or vegetable garden, there will not be much liability of another rubbish pile growing on or near that place. In other words, we hope to make a geranium or tomato grow where rubbish formerly flourished. We are availing ourselves of the services of the Park Department, City Planning Commission, Board of Sanitary Commissioners, and in fact, all City Departments having to do with the general appearance of our city, and the foundation is being laid for a city-wide effort which should, within the near future, make our city one of the beauty spots of the country. In the Fall, we will have a clean-up campaign and a campaign of education in regard to fire prevention measures, and this will be followed up by a "No Accident; No Fire Week" in November.

Our Committees on Laws and Ordinances is giving careful attention to the preparation of a city ordinance making rigid provisions for the elimination of the shingle roof, and is also preparing a bill for the presentation to the next Legislature covering Personal Liability for Preventable Fires. We are just beginning to realize the length and breadth of a fire prevention program, and our experience indicates that it achieves the following results for a city:

1. Makes for better health conditions through the instrumentality of Clean-Up programs.
2. Decreases fire loss.
3. Decreases the loss of life due to fire.

4. Is essentially a Safety First Campaign.
5. Makes a City Beautiful through the elimination of rubbish piles, dilapidated buildings and other fire hazards; and
6. Makes better American citizens.

Our neighboring city, Cincinnati, has achieved wonderful results through the instrumentality of its Fire Prevention Campaign, which has been waged unremittingly for the past several years, their records showing a reduction in fire loss of more than one and one-half million dollars a year; a reduction of 20 fire houses, with a consequent reduction in taxes and an insurance rate which is said to be the lowest in the United States. What Cincinnati has done, Indianapolis can do, and what we can do every American city can do.

Resolutions.

In order to get this matter before the Association in concrete form, I desire to present the following preambles and resolutions and move their adoption:

WHEREAS, America's fire loss has reached the proportions of a national calamity and as a nation we are becoming criminally careless; and

WHEREAS, The United States and Canada are suffering from economical impoverishment due to excessive annual losses of their created and natural resources from preventable fires; and

WHEREAS, Proper fire prevention and extinguishment is a subject closely related to and affecting the competent conduct of the waterworks systems of the states, provinces and municipalities of these countries:

IT IS THEREFORE RESOLVED, That the American Water Works Association pledges its active interest in furthering and participating in all proper efforts to reduce the fire losses of these countries and calls upon its members actively to initiate, assist and encourage in their various localities movements to this end.

I would further move that the American Water Works Association affiliate with the National Fire Protection Association and that effort be made to induce our members to join the National Fire Protection Association.

I would further move that the American Water Works Association call upon all of its members to comply with all reasonable regulations and requirements of the National Board of Fire Underwriters to the end that their water plants may furnish adequate fire protection service, and I would further move that the American Water Works Association use its every effort to bring about the enactment of laws covering Personal Liability for Preventable Fires.

LARGE CONTRACT FOR WELLAND CANAL.

TENDERS are being called for the completion of sections 3 and 4 of the new Welland Ship Canal, by the Department of Railways and Canals. Tenders close June 9. These two sections comprise the heaviest portion of the work yet to be done, running as they do through solid rock, and include the erection of locks 4, 5, 6 and 7, of which locks 6 and 5 are twin in flight. The estimated value of the contract is thirty million dollars, and the whole of the work has to be completed by March 31, 1926. The locks on this section are the largest locks in the world, equalling an ascent of 139½ ft. Each lock is 800 ft. long, with 28 ft. of water on sills. It is estimated that there are about four million cu. yds. of rock and twenty-six million yds. of earth to be excavated on this section, and about one million five hundred thousand cubic yards of concrete to be laid.

The specifications call for the successful tenderers to purchase all the plant and equipment now owned by the government on the sections, valued at \$2,500,000, thus making the contract the largest ever awarded in Canada calling for the expenditure of thirty million dollars for

work to be done and for the contractor to pay two and a half million dollars for the purchase of the plant.

These two sections run through the town of Thorold. Since 1919 they have been working on the cost plus system of contract. Doheny, Quinlan and Robertson being the contractors, but the government now desire to revert to the unit price contract. Alex. J. Grant is the engineer in charge of the whole canal, while F. S. Lazier is the divisional engineer for sections 3 and 4.

REGULATIONS COVERING SPEED, ETC. OF MOTOR TRUCKS.

AT the National Highway Traffic Association convention held on May 12 in New York City, a report was presented by the National Committee on "Regulations Covering Speeds, Weights and Dimensions of Motor Trucks." The Committee unanimously decided on the following extreme dimensions for motor trucks: width, 96 in.; height, 12 ft. 6 in.; length 30 ft. The maximum axle loading to be 22,000 lbs., and for solid rubber tires 800 lbs. per inch of tire width measured at the base of the rubber.

There still exists a diversity of opinion among the members of the committee as to the maximum permissible weight per vehicle, the highway engineering members refusing to approve the 28,000 lb. maximum which was the consensus of opinion of the balance of the committee. At the last annual convention of the Association in April 1921, this question was referred to the members there assembled, and the convention by a large majority approved the 28,000 lb. limit, the highway engineering members still votely adversely.

The following speeds were adopted:

Gross Weight, lbs.	Country.	City
4,000	25 miles	20 miles
8,000	20 miles	20 miles
12,000	20 miles	15 miles
16,000	15 miles	15 miles
20,000	15 miles	15 miles
24,000	15 miles	15 miles
28,000	15 miles	15 miles

We still consider that there is insufficient data available on the use of pneumatic truck tires to enable us to make any definite recommendations concerning them further than to say that, the use of pneumatics seems to reduce the force of impact on the road surfaces to a certain degree, and also that, experiments seem to indicate that they cause fully as much wear on hard surfaced roads as do the solid tires, and even more wear on gravel and certain forms of macadam.

The only trailers that should be permitted to operate through congested regions, would be so constructed that they would have no tendency to weave from side to side.

Laws concerning the number of trailers which would be permitted behind one tractor, should be sufficiently elastic to limit the number to one, where traffic congestion is great, and to permit more than one where such congestion does not exist.

SPECIFICATIONS FOR REFRACTORIES.

AT the last meeting of the advisory committee of the U. S. Bureau of Standards, on specifications for refractories, it became evident that additional investigation would be necessary to determine what test requirements are most effective in drawing the line between satisfactory and unsatisfactory brick for furnace linings in stoker fired boilers. As a result preparations are being made to conduct an extended series of tests, including a 72-hour reheating test at 1450 deg. C. A prominent consulting engineer is co-operating with the Bureau in this work and in addition to gathering information as to the suitability of different brands of brick, is arranging to have a quantity of samples representing about 20 brands shipped to the Bureau of Standards by the users.

ANALYSIS OF PRESENT HIGHWAY TRAFFIC*

Benefits from Increase in Motor Traffic — Registration Heavier — Effect of Heavy Trucks on Road Surface — Two and Three Ton Units Are Economical Sizes.

By John H. Mullen,

Chief Engineer, Minnesota Highway Department.

WITHIN less than fifteen years a complete revolution of highway transportation has taken place, changing within that period from horse drawn to almost entirely motor driven traffic. On account of small percentage of horse drawn vehicles we are now inclined to eliminate them from consideration as a governing factor in traffic studies, but as an obstacle to speed and consequently as a limitation on the volume which may be carried over a congested line, this traffic is of importance and calls for thought on the part of highway engineers, to provide some relief such as slow traffic lanes along the sides of heavy traffic roads. Most of the road pavements in the United States have been built to a width of 16 to 18 ft. and generally without shoulders adequate to carry a line of slow moving traffic. The result is that when one of these roads carrying from 30 to 50 horse drawn vehicles acquires a traffic of over 1,500 vehicles per day there is congestion, decrease of speed and danger of collision on account of difficulty in passing. The decrease in horse drawn as a percentage of the total traffic has been very rapid, but this does not mean that the volume of horse traffic has decreased in like proportion. On the contrary on many main roads it has remained practically constant and in some instances has increased. As a typical example, the average daily traffic count for the four past years on one of the main roads in Minnesota, show horse drawn in the following number of vehicles, i.e. 17, 33, 35 and 38 per day, a reasonably constant number, while the same road for the same years showed motor vehicles to the number of 440, 501, 883 and 1,230 respectively. This situation would not exist on roads connecting contiguous industrial centres but will be found to be fairly general in agricultural communities, particularly where farms are small and horses are required for other farm work. In other words, throughout the United States, horse drawn traffic will have to be reckoned with as a minor element in highway transportation for many years.

Motor Trucks Develop Trade.

The remarkable increase in the number of motor vehicles in use in this country, has brought many benefits. As a business proposition, the motor vehicle has increased the trade radius of the merchants and has made accessible for dairying and quick marketing great areas of land which could formerly be utilized only for grains and staple crops. It has also made possible the de-centralization of smaller industries formerly confined to restricted districts on account of slow trucking, but which are now enabled to locate in suburban territory. It is predicted that with the improvement of roads this latter condition will be developed to an extent that will greatly improve the living conditions of industrial workers. The motor vehicle is revolutionizing the social life of the country. Formerly the general travel radius on roads did not exceed ten miles and the visiting radius in rural districts was two or three miles. The trip to town was a weekly affair taking a whole uncomfortable day. Rarely was there any visiting between towns or to different parts of the country excepting on railroad excursions. But with the advent of the motor vehicle the travel radius on highways has been greatly extended and is limited only to the conditions of the roads. We find in the lake regions of Minnesota during the Summer, cars from nearly every state in the Union; the census at 137 stations in the State during 1921 showing an average daily traffic of 565 cars of which 59 or more than 10% were from other states. It is reasonable to assume that not less

than another 25% were from other counties within the State, which at an average of three people per car mean at least 600 outside visitors per day passing each recording station. Practically every farmer now has an automobile and in the rural districts of the Middle West. One of the greatest benefits is through the consolidation of rural school districts made possible by motor transportation, which is giving to the farm children throughout the country the advantage of graded schools without having to move to the cities. All of this is giving us a broader view of life and creating better general conditions, but at the same time is increasing traffic on the highways, which requires extensive programs of road construction and maintenance.

Remarkable Increase in Registration.

From such records as are obtainable, it appears that the increase in motor traffic is very nearly in the ratio of increase of motor vehicle registration. This increase in the United States, follows a rapidly rising curve, starting at 48,000 vehicles in 1906, running to 500,000 in 1910 and 2,423,788 in 1915. From 1915 to 1920 the increase is practically uniform at the rate of about 1,300,000 vehicles

COMPARISON OF FIRST CLASS L. C. L. FREIGHT RATES — EXPRESS RATES AND AUTO TRANSPORTATION RATES

per year, with a total registration January 1, 1920, of 7,523,664. During 1920 there was an increase of 1,754,697, making a total registration on January 1, 1921, of 9,278,361. Registration for the first six months of 1921, as reported in "Public Roads" is 9,245,195, a decrease of 33,166, which would indicate a considerable falling off in

*Paper read at the annual meeting of the American Association of State Highway Officials, Omaha, Neb.

the ratio of increase of cars this year. This is to be expected, for it is estimated that the number of cars in proportion to population is approaching a reasonable maximum. In 1915 there were in the United States 42 persons per car, in 1919, 14 per car and in 1920, 11 persons per car. The 1920 figures range from a maximum of 31 persons per car in one of the southern states, to 5 and 6 in well developed agricultural sections, with 12 to 14 persons per car in the industrial sections where roads are practically all improved. It may safely be predicted that the number of automobiles will not exceed one to five people in the agricultural sections and one to ten people in the industrial sections of the country, even under the most prosperous condition, with the probability that there may be a falling off in ratio during times of depression, for it must be admitted that prosperity has a considerable bearing upon the number of passenger cars in the country.

Seasonal variation in traffic as shown by records would indicate that probably 25 to 35% of that on the main lines is regular and may be classed as business or necessary traffic. This traffic will continue to use those main lines and would not be diverted by improvement of parallel roads, but the balance which may be classed as convenience or pleasure traffic will in part seek other routes when the main lines become congested. This leads one to believe that a considerable portion of the traffic will be taken care of by parallel roads, and excepting for suburban roads and routes physically confined to one line between centres, the volume will not greatly increase on the present heavily travelled roads, but will be spread more uniformly over parallel routes.

Commercial traffic, including trucks and passenger busses presents the most difficult problem for solution by the highway officials. This class of traffic has had a marvelous development within a very few years, but this development cannot be accurately estimated for the reason that many of the States do not have a separate registration for trucks, and traffic counts are scattering and not uniform enough to allow for tabulation. It is estimated that there were approximately 988,000 trucks and commercial cars registered for the year 1920, or slightly over ten per cent. of the total motor vehicles. That the trucks are confined more to cities and do not use the rural highways in proportion that automobiles do except in industrial sections, is evident from observation and traffic counts, but it is also very evident that the ratio of increase in the number using the roads is greater. For example, traffic counts taken at the same stations on State roads in Minnesota show daily averages for 1917 of 463 automobiles and 8 trucks, while for 1921 the average are 1,099 automobiles and 72 trucks. Reduced to percentage the increase in autos is 23% while the increase in trucks is 900%. These figures are taken on roads which were not substantially changed as to surface and the increase is not due to paving or other influence authority for the statement that practically the same situation exists in eastern States but of course in much greater volume, and cities had surfaced roads in Rhode Island upon which automobile traffic increased 162% in the past six years while the truck traffic increased 659%. The percentage of trucks to total traffic is also comparable in both of these cases. In Minnesota the increase being from 1% to 6 1/2% in five years, and in Rhode Island from 3% to 15% in six years. An abstract from the traffic counts made throughout the country indicates that practically the development of trucking. Professor Blanchard is of the same ratio of increase prevails and that the ratio of trucks to cars comes within the range of percentages above stated, which is an indication that we should figure the main arterial highways to carry truck traffic in the amount of about 10% of the total, running up to 20% or better on main arteries connecting centers within fifty miles of each other, and not less than 5% on what might be termed passenger trails.

Heavy Trucks in Minority.

Observation on the kinds of truck traffic are interesting, and contrary to the general impression we find that

the heavy truck is very much in the minority and with the usual exception of roads connecting contiguous cities, the five ton truck does not average more than 10% of the total truck traffic, while 75% of the trucks are two tons and less. It is to be expected that truck routes up to 50 miles in length will have an increasing number of five ton or larger trucks, but up to the present time and in the near future the bulk of the traffic is what may be termed express rather than freight and can be hauled more economically in the lighter trucks. Furthermore, one of the considerations in selecting truck service in preference to railroad service is speed and the convenience in the pick up and distribution of loads, which are points in favor of the lighter truck. A bulletin was recently issued by the Department of Agriculture dealing with motor trucks on farms, in which it is stated that on a survey of 753 farms in the eastern states it is found that farmers own trucks of all sizes ranging from 1/2 to 5 ton capacity, but that nearly half of the trucks used on farms are of the one ton size with only 3% of the owners recommending trucks of over two ton capacity. The same condition is found to exist in the Middle West where farmers at a considerable distance from railroad stations are using trucks quite extensively and in practically all cases are selecting trucks of two ton or less on pneumatic tires. The extent to which this traffic may grow is dependent almost entirely upon the improvement and systematic maintenance of roads, for a steady traffic of 20 trucks per day regardless of weather conditions, is more injurious to an earth or gravel road than automobile traffic averaging 300 cars per day.

Commercial trucking of commodities outside of cities has developed somewhat blindly and it is found that this service has not been generally profitable to the truck owner except where the entire length of the route traversed is hard surfaced. As an example, a terminal truck service was established three years ago at the Twin Cities in Minnesota and in the second year 25 companies were operating through this agency over all kinds of roads. Of this number, seven have discontinued business on account of poor sections of road on their routes, the remaining eighteen companies are continuing to do business in a more or less profitable way dependent upon the proportion of good roads on the lines they cover. This service has been conducted practically the same as railroad service with regular tariff sheets for the various lines and with cargo insurance in all cases. An attempt was made to work on a schedule but this was found practically impossible on account of weather conditions and unfinished sections of road which prevented hauling at certain times.

Lighter Trucks More Popular

The interesting features to engineers in analyzing this service is that the trucking companies find two and three ton units on pneumatic tires to be the economical size. A chart of the rates as compared with first class L.C.L. freight rates and first class express rates shows that the auto transportation rates while about 100% above the freight rate is only 50% of the express on the short haul but for the longer haul the ratio of difference between freight and auto increases, and between auto and express decreases, showing that the unrestricted use of public highways for commercial trucking works very much to the disadvantage of railroad express business for distances up to about 100 miles, but for short haul freight, when taking into account the terminal trucking, the auto transportation will relieve the railroads of what they have always claimed to be an unprofitable business and this at a decreased cost to the public. In this connection it is interesting to note the reported statement of officials of a railroad company in New England that the railroad loses one million dollars a year in freight revenue on the shoe industry alone as a direct result of motor truck competition and that some of the small branch lines in the industrial sections of New England have been abandoned by reason of their inability to meet motor truck competition.

So far as traffic is concerned motor bus service may be included as trucking, for most of the busses are two-

ton high speed trucks. This bus service is becoming general throughout the country and is conducted profitably during favorable weather at rates slightly less than railroad passenger rates. We find however, that there is a decided falling off in the motor passenger business during bad weather and in the Winter. Continuous bus service is only established on long sections of surfaced roads, and with the paving or even gravelling of connecting lines of travel we may expect a substantial development of this traffic with its consequent effect upon the railroad passenger business.

Motor Vehicle Taxes

It is very evident that in fairness to the tax paying public and the railroads, there must be a State supervision of commercial use of the highways, and that gross earnings taxes should be imposed for this privilege, or at least that more equitable motor vehicle taxes be fixed for such use of the roads with all revenue made available for road purposes. It is only reasonable that commercial traffic should carry its share of road expense and that the State should prohibit the commercial hauling of passengers or commodities on public highways except by responsible concerns bonded and supervised by the State.

As stated with reference to horse drawn traffic, the volume which a given road may carry is governed very largely by the manner in which traffic is handled. Practically all State laws now prescribe a maximum speed limit of 25 miles per hour with no reference to minimum speed. To properly handle traffic the maximum on heavy passenger lines should be increased to 40 miles per hour for certain hours of the day, with a requirement that traffic must stop on the intersecting lines before crossing or entering the main lines and there should be a minimum speed limit on main lines of 25 miles per hour during those hours. It will be found that roads which now appear to be congested will very easily handle their traffic within these limits, and there is no reason why the minimum rate should not be imposed for at least a 12 hour period from about 8 in the morning until the same hour in the evening. This will take care of the peak load of passenger and light express business and will cause the slow heavy trucking to be handled during the night time when there will be no interference on either side. This and other effective traffic regulation calls for a state system of traffic police, the value and efficiency of which has been well demonstrated in the State of Pennsylvania.

Economical Limit of Weight.

Highway engineers and most truck manufacturers are practically agreed upon an economical limit of weight of vehicles and wheel loads for public highways. This is expressed in the proposed uniform traffic law adopted by the American Association of State Highway Officials and which has been incorporated in the highway laws of several of the States, but in all localities we find an occasional trucking company or truck manufacturer using excessively heavy vehicles. If this were allowed to continue the public would be called upon for an unwarranted expense to rebuild roads destroyed by that small portion of traffic and it is therefore extremely important that a uniform limit be established throughout all of the States and this limit should be well within the maximum prescribed in the proposed traffic law.

In making a study of highway traffic one is impressed by the lack of definite comprehensive information on the subject and the conclusion is that in every highway department there should be an engineer assigned to traffic surveys. These surveys to be made in a somewhat uniform manner in all of the States and the results compiled for the whole country by the government Bureau of Public Roads. The highway departments are not organized primarily for the purpose of moving dirt and building pavements, but in performing their real function in the development of the country they are in fact great traffic departments designed to provide means of carrying the tremendous volume of highway transportation and to properly do this work, the systematic study of highway traffic is essential.

CAISSON DISEASE BECOMING LESS DEADLY.

HEALTH hazards which at one time were regarded as inherent in the occupation of shaft sinking and tunneling under the high air pressures necessary to keep back the water in wet ground and quicksand, have been greatly reduced according to the United States Bureau of Mines. Observations made by Dr. Edward Levy, consulting physiologist of the Bureau, during the progress of tunnel work in and about New York City, indicate that the methods employed there have become so systematized and improved as almost to eliminate severe or fatal cases of compressed-air illness. The results of physiological studies made by the Bureau of Mines in the depths of its experimental coal mine at Bruceton, Pa., will be utilized in the construction of the vehicular tunnels to be built under the Hudson River between New York City and New Jersey and in the twin vehicular tunnels now under construction at Pittsburgh, Pa.

Compressed-air work has assumed a place of enormous economic importance in modern engineering. Frequently deep-mining operations, subaqueous tunneling, and bridge building can be conducted only by the aid of compressed air. The construction of underwater tunnels or "tubes," the principal means of intercommunication between such large business centres as Manhattan Island and Brooklyn, would be impossible without it. The prosecution of these various activities requires the employment of numbers of men who work under varying degrees of air pressure. The effect of compressed air upon the life, health, and efficiency of workers becomes, therefore, of increasing importance in the study of occupational diseases and the medical problems of industries. No thorough research has been done in this field in the United States. Knowledge of the cause, character, and treatment of compressed-air illness is still limited to a very few physicians, and thus far little interest in the subject has been evinced by the medical profession at large.

Cause of Disease.

Caisson disease, compressed-air illness, or, more properly speaking air embolism, is a condition caused by a too rapid decompression after exposure to higher pressures for a period of time. The symptoms of compressed-air illness are vertigo, difficult breathing, localized pains, affections of the central nervous system, and unconsciousness or collapse. The formation of gas bubbles of nitrogen in the body fluids and tissues is the accepted theory at present of the cause of caisson disease.

In an employment so hazardous as that of a "sand hog" some attention should be paid to the class of men best fitted for it, the Bureau of Mines declares. Actual experience has led to the conclusion that in the selection of men the essentials are normal lungs, normal kidneys, and a good heart; in the older men the blood pressure must not be high. In the selection of workmen for compressed-air operations, the Bureau is not sure that advanced age is quite the important factor that many writers have insisted; neither is it considered that fleshy men are unduly susceptible to compressed-air illness.

Treatment by Recompression.

Long before any great American projects requiring the use of compressed air were undertaken it was recognized that recompression was the correct treatment for compressed-air illness. A worker suffering from compressed-air illness should be put in a medical lock and the pressure rapidly raised to that in which he had previously worked. It is a good policy to keep the patient at this pressure for a short time in order to be sure that the bubbles of nitrogen have been thoroughly compressed and again taken up by the circulation. The patient may then be decompressed again by the stage method, except that now the time should be double in every part of the decompression. Although symptoms are frequently relieved before the pressure in which the men had worked is reached, it is safer to attain the original pressure before decompressing.

TRAFFIC CAPACITY AND WIDTHS OF HIGHWAYS OUTSIDE MUNICIPALITIES*

Functions of Roadway Affecting Width—Investigation Into Traffic Speeds—Roadway Widths and Safety of Traffic.

THERE has been a large quantity of statistical data compiled throughout the country in the nature of a traffic census and many traffic studies have been made to determine the future traffic for given highways. Most of such data is not of maximum value, however, in determining the desirable width of roadways for a given traffic, in as much as the variation in speeds of various classes of vehicles generally is not given consideration. Any computation of required width of roadway based upon the assumption that all the traffic on a given highway outside of a municipality will travel at a common speed should be used with great reserve as the assumption is obviously incorrect in all but exceptional cases.

For the greater part, highways outside of municipalities need have but two lanes of traffic to care for the traffic which they are called upon to accommodate. Highways leading into large municipalities or connecting nearby cities, however, present a problem that calls for careful solution in as much as they may and often do carry traffic that varies in speed from about three miles per hour to thirty-five miles per hour. In many cases the quantity of traffic approaches and often exceeds, the economical traffic capacity of a two lane roadway, although computations may show that the amount of traffic anticipated from traffic surveys could be carried adequately by a two lane roadway if the traffic is assumed to travel at a common uniform and properly selected speed.

Factors Controlling Width.

In cases of highways which are to carry congested traffic, the designing engineer must give careful consideration to all functions of a roadway which should affect his decision in choosing the number of lanes of traffic to be required and the modification of widths of roadways and shoulders for any given number of lanes. The functions of a roadway which thus affect the design of its width are enumerated as follows:

1. To provide a sufficient number of lanes to carry the traffic that comes upon it.
2. To provide means of allowing fast moving vehicles to pass vehicles moving more slowly, the speeds being within legal and operating limits.
3. To provide for the ranking of vehicles at the roadside in such cases as for necessary temporary repairs.
4. To be of such a width as to discourage the taking of dangerous chances by operators of vehicles.

When a two lane roadway has become so congested that it is impossible to operate a vehicle without considerable loss of time due to traffic delay, its economic traffic capacity has been exceeded. This degree of congestion occurs for a traffic count of a great deal less than that equal to the computed traffic capacity of the roadway when variation in speed is not considered. As the amount of traffic or speed variations increase, the possibility of passing a slowly moving vehicle when it is overtaken becomes less. Ultimately, it becomes entirely impossible for vehicles to pass each other and all traffic must assume the speed of the slowest moving vehicle.

To emphasize the relation that should exist between traffic and roadway widths, the results of office computations and field observations of traffic operation made* by the chairman of the committee may be of interest.

Variation in Speeds.

For one typical series of investigations for a two lane roadway, a traffic of 750 vehicles per hour was assumed,

500 of which travelled in one direction, the remainder travelling in opposite direction. Three assumptions as to variation in speeds were made.

- First; 3 percent were assumed to travel at 3 miles per hour, 10 percent at 10 miles per hour, 57 percent at 20 miles per hour and 30 percent at 30 miles per hour.
- Second; 13 percent were assumed to travel at 10 miles per hour, 57 percent at 20 miles per hour and 30 percent at 30 miles per hour.
- Third; 13 percent were assumed to travel at 10 miles per hour and 87 percent at 20 miles per hour.

It was found that under the first assumption that the meeting of two of the 3 mile-per-hour vehicles slowed down traffic each way along the road for a distance of one quarter mile. The meeting of vehicles of various faster speeds affected the movement of traffic similarly but to a less degree. It was also evident that 750 vehicles per hour, two thirds of which are travelling in one direction and under the first outlined assumption as to variation in speeds, could not be operated on a two lane roadway.

Under the second assumption of speeds, the meeting of two slow vehicles affected the traffic for a distance each way along the road of 300 feet, and the operation of the traffic under this assumption was entirely possible.

Under the third assumption the traffic was shown to operate smoothly and the quantity could have been considerably increased.

The foregoing results should be compared with computations based upon the assumption that all vehicles will travel at a common speed. Under logical assumptions as to clearance between vehicles, and assuming that all vehicles will travel 15 miles per hour, a two lane roadway should carry about 2600 vehicles per hour in each direction. If the speed is reduced to 3 miles per hour by a few heavy horse drawn vehicles, the capacity is reduced to about 750 vehicles per hour in each direction. There can be no doubt, therefore, that the variation in speeds affect the traffic capacity and hence the required width of a roadway.

Quite obviously, a stalled car which, through inadequacy of shoulder design, is prevented from pulling to one side and hence blocks one lane of traffic, has the same or a worse effect on the traffic capacity of a roadway than a slowly moving vehicle. The roadway traffic capacity can be materially increased by adequate width and design of shoulders.

The safety of traffic should not be disregarded in the design of roadway widths. In the case of a two or four lane roadway, every vehicle operator realizes just when he has the right of way and when he has not. The operation of a three lane roadway, however, is not so simple. The centre lane is not and cannot be reserved for traffic in either direction, so it must be left to each individual operator to decide whether he is more entitled to this lane than another operator going in the opposite direction. Such a width of design fosters danger to traffic.

Conclusions for Consideration.

The following tentative conclusions were submitted for consideration.

1. The design of roadway widths must give consideration to the economically desirable variation in speeds of the various classes of traffic.
2. Any two lane roadway carrying intensive traffic should have a width of 20 ft. and should have 5 ft. shoulders capable of sustaining standing vehicles for temporary delays.
3. A two lane roadway should be increased to a four lane roadway when the traffic is reduced to the speed of the slower vehicles through not being able to pass, if the economic loss of time will justify the expense.
4. The building of three lane roadways should be discouraged due to the danger to the travelling public.

*Report of National Committee presented at National Highway Traffic Association Meeting, New York City, May 12.

PROTECTION OF PILES BY GUNITE.

Encasement of 2 in. of Reinforced Concrete Resists Marine Organisms — Piles Withstand Driving and Rough Handling Without Damage.

AMONGST the many methods proposed for protecting wooden piles from the ravages of marine organisms, one of the most promising is the coating of the pile by gunite. While engineers have been satisfied for some time that a mortar coating of perhaps 2 in. would be sufficient to afford the required protection, the problem of so reinforcing this protecting shell that the pile might be driven without breaking the shell has required careful study.

In this connection the experience of the engineering staff of the Port of Tacoma, Washington, is of value. A total of 1442 piles representing a total length of 78,237 ft. were driven in the Tacoma work with results that are said to be uniformly excellent.

To ensure that the proposed protection would stand the driving, two test piles of the form indicated in Fig. 1 (a) were driven. The first pile was driven without the use of a jet, the hammer weighing 4,500 lb. and the drop being 5 ft. No cushion was used between the pile and the hammer. On the 45th blow the gunite began to show

appears to have been satisfactory in work undertaken elsewhere. Thus, the piling for a trestle built by the Puget Sound Power and Light Co. done in recent years was thoroughly examined in the autumn of 1921 and found to be in excellent condition. The Freeport Sulphur Co., of Freeport, Texas, drove, in 1920, a total of 87 piles 50 to 60 ft. long encased with gunite approximately 25 ft. each, that is for the portion of the pile between the mud line and the water surface. The gunite coating was not injured in driving and the protection against the teredo has been entirely satisfactory.

ENGINEERING INSTITUTE ELECTIONS

At a meeting of the Council of the Engineering Institute of Canada, held on May 22 in Montreal, the following elections and transfers were announced:

Members—J. R. Atkins, Ottawa; L. F. Goodwin, Kingston; F. Y. Harcourt, Port Arthur; L. C. Hill, Montreal; J. D. Jones, Sault Ste. Marie; J. H. G. Marshall, Ottawa; W. W. Meadows, Maple Creek, Sask.; A. H. Morgan, London; Thomas Shanks, Ottawa; J. H. Turner, Coalhurst, Alta.; G. G. Underhill, Montreal; B. W. Waugh, Ottawa.

Associate Members—H. J. Clark, Belleville; W. P. Dale, Niagara Falls, Ont.; H. M. Fletcher, Hamilton; R.

FIG. 1—TYPES OF PROTECTED PILES USED IN HARBOR WORK BY PORT OF TACOMA, WASH.

small cracks, whereupon the hammer was raised so as to give a fall of 15 ft. with the idea of wrecking the pile. This was not accomplished until the 75th blow occurred, when large cracks opened up in the gunite in line with the 3/4-in. vertical rods.

The second pile tested was constructed also according to Fig. 1 (a). This was first jetted into place with the point down, then pulled up and jetted into place butt down, with no damage to the gunite after these two operations. The pile was also treated very roughly, that is, it was picked up with a line attached to one end, thus resolving the pile in a single span subjected to bending due to its own weight and to the shock of handling.

In view of the results of this test, it was decided to discontinue the use of the vertical rods and of the poultry netting, and use one wrapping of American Wire & Steel Co's welded fabric with No. 12 gauge wire at 12 in. centres both ways, as shown in Fig. 1 (b).

The new form of pile devised for the Tacoma work is shown in Fig. 1 (b). It is proposed to drive the piles butt down for the reason that 15 ft. of gunite will be saved in so doing, and the same bearing value will be realized as if the pile had been driven point down and gunite full length. It is assumed that the whole bearing value arises from skin friction.

Experience with wooden piles coated with gunite ap-

PRESENT DAY TARS FOR PIPE COATINGS*

Dr. Angus Smith's Solution — Standard Specification for Pipe Coatings — Quality of Tar Used at Present Time — Objective for Research Work.

By William R. Conard.

MORE than 70 years ago a process for coating cast iron pipe, using coal tar, was developed by Dr. Angus Smith and this process, or variations of it, have been in practically constant use since for cast iron, and it or coatings with an asphaltum base have been used for wrought iron and steel. For the smaller sizes of wrought pipe galvanizing has also been extensively used, as well as lead lining and cement lining. At the time Dr. Smith invented his process, "coal tar" was a residue from the manufacture of gas from coal, just as it is today, only in those days the many by-products now obtained from this residue were apparently little known, and the tar was in every way what is termed "Virgin Tar". Could the good Doctor have foreseen some things, such as by-products, tar from oil and water gas sets, etc., it is probable that he would have given much more detailed specifications, and placed many safe guards around the coating and process.

Standard Specifications.

The standard specifications for coating pipe are as follows:

Every pipe and special casting shall be coated inside and out with coal-tar pitch varnish. The varnish shall be made from coal tar. To this material sufficient oil shall be added to make a smooth coating, tough and tenacious when cold, and not brittle nor with any tendency to scale off.

Each casting shall be heated to a temperature of 300 deg. Fah, immediately before it is dipped, and shall possess not less than this temperature at the time it is put in the vat. The ovens in which the pipe are heated shall be so arranged that all portions of the pipe shall be heated to an even temperature. Each casting shall remain in the bath at least five minutes.

The varnish shall be heated to a temperature of 300 deg. Fah. (or less if the engineer shall so order), and shall be maintained at this temperature during the time the casting is immersed.

Fresh pitch and oil shall be added when necessary to keep the mixture at the proper consistency, and the vat shall be emptied of its contents and refilled with fresh pitch when deemed necessary by the engineer. After being coated the pipe shall be carefully drained of the surplus varnish. Any pipe or special casting that is to be recoated shall first be thoroughly scraped and cleaned.

This follows somewhat the specifications as first developed by Dr. Smith, but you will immediately note the term "Coal Tar Pitch Varnish." The terms pitch and varnish are used a number of times when as a matter of fact the material is not pitch nor is it varnish as they are generally understood. Pitch is the residue of tar after distilling, or is an extract of "pine tar," and varnish is generally understood as being a resinous product. Another thing the kind or kinds of oil and the proportions are not definitely stated, and in this connection variations in season and weather, and the opinion of individuals, should be offset by definite statement.

Coal Tar.

Average coal tar is made up of carbons, oils, acids and gases. The acids and gases in the forms of hydrogen, oxygen, nitrogen and sulphur. Its main body is carbon and it is the carbon held together by the oils which protects the metal from corrosion, and it is the acids that tend to attack and corrode. Therefore it is desirable to use for pipe coatings a tar as free from acids as possible, and high

in carbon and oils, especially the heavier oils, and to use coating at temperatures that will not evaporate the oils.

Coal tar and the by-products that are being extracted therefrom are put to a wide variety of uses. The heavier material usually called tar (no matter how much it has been distilled or refined) is used for paving, road work, the varying forms of roofing materials, such as paints, etc., while the lighter part is used in many lines of industry particularly in the manufacture of chemicals, so that its value is greater for refining purposes than in its crude state, which condition is the best for pipe coating purposes. The result is that unless the pipe maker controls some source of production, he has to compete with the refiner, with the consequence that there are times when he gets deceived, and the pipe purchaser is the innocent sufferer. This does not mean that the pipe maker is responsible for this, but it is simply due to circumstances.

It will be many years before the supply of bituminous coal from which we get our tar is exhausted, but as the by-products become greater in variety and value, the keener the pipe maker will have to compete, and the greater will become the cost. At present the tar used for pipe coatings is about 15 per cent. of the total cost of coating pipe, but when is the point going to be reached when economy ceases, in using coal tar, and what other material or materials can take its place?

It is not the purpose of this paper to attempt to technically cover the various points that the subject of pipe coatings brings up, but it is the belief of the writer that while the pipe maker specifies and tries to get "virgin tar," that the tar does not contain as large a proportion of the heavy mineral oils as the tars of Dr. Angus Smith's time contained, so that, there are cases where the coating is not as durable as it was formerly. It is the writer's further belief that it is high time that careful and more extended studies, and research should be undertaken to see what might be done about it, and it is entirely within the range of possibility that even using coal tars that have had their by-products extracted together with some other material or materials whether oils or some other form of binder, that a better and more durable coating than is now used can be found. I would not suggest disregarding tar entirely, for there has not yet been found anything that could within economic limits take its place, and I do not think that the virgin tar of today is the last word in pipe coatings, but I do think that thorough research would develop some other material to mix with tar that would form a much better protection to iron and steel pipe surfaces than we are now using.

Research Work.

When we speak of research work it does not mean that investigation has not been made for it has. Dexter Brackett 25 years ago made tests, keeping Thos. Wiggin at the foundries for many months to try and get a better coating. Allen Hazen in 1908-9 had some careful work done. Clarence Goldsmith about 1913, for the Boston high pressure fire service in collaboration with Frank McInnes, tried a variety of tar coatings. The result of Mr. Brackett's and Mr. Wiggin's work in a large measure, is responsible for the specification as at present written. Mr. Goldsmith's work resulted in a specification using tar and rosin, which gave a coating a good appearance but due to the temperatures used, it did not appear to have the lasting qualities required. As a result of his investigations Mr. Hazen favored a tar distilled until the naphtha was removed with enough linseed oil to give a smooth, tough and tenacious coating for steel pipe. As this apparently applies primarily to steel pipe, the writer does not see it mentioned for cast iron, it is rather assumed that the present standard requirements for cast iron are acquiesced in by Mr. Hazen.

Apparently all of these investigators tried other materials, and by a greater or less eliminating process got back to coal tar. At the same time all apparently agree that the various factors such as, heat of the pipe for varying thicknesses, heat of the tar bath and keeping it of known proportions of fresh and old tar, knowing the temperatures,

*Paper read at Annual Meeting of the American Water Works Association, Philadelphia, May 15-19, 1922.

of both pipe and bath and maintaining at predetermined temperatures so as to obtain uniform results, are the prime considerations but all of this as indicated requires men of greater skill and intelligence than the average pipe coater; better, and more extensive apparatus and facilities for doing the work than exist as an average, even at the present time; and after there were attained a very strict adherence to them.

From what the writer has observed of pipe, which have been in service and for some reason taken out, conclusion is that the coating on the pipe is not impervious to moisture, having small pores which usually extend through the coating. This allows the moisture to get to the metal, ferrous oxide forms coming out through these pores, and spreading over the interior of the pipe. Perhaps you may have noticed in pipe taken out that when you take off some of the scales formed that you will find apparently good coating underneath. Therefore while as before stated I do not see that tar should be discarded, research should be made to see whether there is something to use with the tar that will seal the pores, which will prevent the forming of the ferrous oxide, and the formation of tubercles.

You get somewhat the same effect when pipe are allowed to lay out in the weather except that in that case the ferrous oxide begins to form under the coating and causes the coating to scale off. Also I believe that investigation should be made of whether pipe of different sizes and classes should be dipped in the tar bath at different temperatures, for the volume of the metal in the pipe controls the number of heat units to be thrown off before the coating can become set, and as long as the heat prevents the setting of the coating, the heat will also continue to evaporate the oils in the tar and tend to leave nothing but dead pitch.

Materials Used With Tar.

As to what materials might be used in conjunction with tar to prevent the forming of iron oxide, there are three methods that have occurred to me. One is coating the pipe especially the interior with some paraffin substance before applying the tar; this was suggested casually by S. B. Brown of Warren Foundry. Another method is to use some substance that has no oil or gas forming constituent, but in very dense and when set impervious to moisture, which will become fluid at approximately the same temperature as tar, will mix tar readily, and can therefore be put in the tar tank, and applied in conjunction with the tar. And still another might be to find some means of getting a much thicker coating on the pipe, which would stay put, and not tend to scale in cold weather, or soften and run in hot weather. The City of Philadelphia had, and I think, still has a specification stating that the coating shall be at least 1/64 in. thick, which would help to some extent but I do not think is thick enough, and with the existing methods in vogue at the foundries, and the tars used, is quite difficult of attainment.

If simply tars are to be used every known constituent should be determined and careful experiments made in an endeavor to determine which are beneficial and which harmful to pipe as a coating; just which will give the longest efficient life.

Summary.

Apparently present day virgin tars do not appear to contain as great an amount of the heavy oils as the old tars, and probably have more of the lighter oils which evaporate more readily.

Present day specifications are at variance with the process developed by Dr. Smith, and the demands of the pipe purchasers on the manufacturer have been such that the old Smith method, which was a rather lengthy operation and involved dipping the pipe cold in hot tar and allowing them to stay in the bath until the pipe became hot, could not be worked today unless much more elaborate apparatus than that of Dr. Smith's time were installed and

this would be necessary to coat the present amount of pipe produced.

Research if undertaken should be along at least these two lines:

The apparatus necessary to care for the present day volume of production, going back to a strict adherence to the Dr. Angus Smith process or:

Using present apparatus and methods, or something similar in rate of working, and find something to mix with the cheaper distilled tars to get a coating that will be as lasting and protective or if possible more so, than the old Smith process.

THE RAILROAD AS AN OPERATOR OF HIGHWAY TRANSPORT*

Highways Used as Feeders For Railroads Where They Can Utilize Motor Transport — Railways in Great Britain Use Highways for Transport

By Arthur H. Blanchard,

Professor of Highway Engineering, University of Michigan.

ONE of the objects of the National Highway Traffic Association is to develop the economic efficiency of highway transport. This Association, which is independent in its findings, and composed of all classes of men interested in highway transport and traffic regulations, should look into the future and endeavor to formulate guiding principles and policies which will enable the highway link in our transportation system to be developed on a sound business basis in the interests of the public welfare.

What is the present attitude of railroad officials in the United States towards the development of highway transport? The answer is not a simple one to formulate as many diverse opinions have been expressed in words and actions. Some of our railroad officials appreciate the intrinsic value of highway transport and have made use of it as a part of their own transportation systems. Others have advocated its development because they appreciate that it is necessary to the success of their business that facilities should be provided for economically transporting goods over highways to be later carried by railways. Others have been concerned regarding the development of highway transport from the standpoint of destructive competition with railroad transportation and have endeavored to curtail its development through legislative action. Others, and it is hoped that there are only a few in this class, have considered the subject from such a narrow viewpoint that they have advocated a curtailment of highway improvement.

The railroads can render valuable service to the public and to themselves by helping to develop highway transport as feeders to rail lines and as extensions of rail service. The railroads can afford to assist in the working out of this problem as some of the basis principles of the economical utilization of highway transport will have been solved only when highway transports service is used to efficiently expand the territory tributary to the railroad lines, to solve the terminal congestion problem, and to relieve car shortage by taking care of the short haul which is now most expensive for the rail lines themselves. A correct and immediate solution of the inter-relationship between these two links of our national distribution system is very desirable in the interests of all concerned. By no means can the railroads afford to ignore the interest they have in the efficient establishment of highway transport as an auxiliary to railroad transportation.

Opportunities For Railroads.

What are the opportunities for the railroad to function as an operator of highway transport?

*Presidential address delivered at the annual meeting of the National Highway Traffic Association, New York City, on May 12, 1922.

First, inter-terminal transportation of freight by motor trucks. The advantages of the utilization of highway transport in this connection have been appreciated by railroad officials. It has been established in some cities, the most notable example being in the case of Cincinnati.

Second, intra-terminal and freight yard highway transport. It is believed that the utilization of motor trucks by railways in transferring commodities, especially l.c.l. freight, from cars to shipping platforms and warehouses would materially expedite the delivery of freight and would reduce idle time of cars standing on sidings.

Third, the collection and delivery of freight in municipalities and adjoining areas. This phase of highway transport, if used by railroads, would be a partial development of what is commonly known as the store door delivery plan. The ruling of the Interstate Commerce Commission in the case of the Baltimore development along this line may mean that it is impracticable for railroads at present to utilize highway transport in this manner except on such a large scale that the charge of discrimination in services rendered could not be brought against them. In England, we find a working illustration of railroads functioning as operators of highway transport in this field. One of the most notable examples is the case of the London and North-western Railway's comprehensive system of freight delivery by motor trucks in areas with headquarters at London, Birmingham, Manchester, Liverpool and Leeds. This railroad establishment this service in 1905 and in 1920 was operating over 350 motor vehicles.

Fourth, extension of transportation service through the medium of motor truck and motor bus routes. There are several methods of development practicable in this field. Urban and interurban electric railway lines may logically expand their passenger transportation facilities through the establishment of tributary motor bus routes. An illustration is afforded by the case of the Akron street railway's acquisition and operation of a fleet of motor buses to supplement their traction system.

Scotch Railway Has Motor Transport.

Steam railroads may enter this field through the development of intercity and rural motor express lines to carry both commodities and passengers. One of the most notable examples is afforded by the highway transport services of the Great North of Scotland Railway Co., which established its first highway transport service in 1903 and its first motor truck service in 1904. In 1921, this railway company was operating five passenger routes varying in length from $7\frac{1}{2}$ to $19\frac{1}{2}$ miles and seven intercity motor truck routes varying from $9\frac{1}{2}$ to $19\frac{1}{2}$ miles.

Railroads having stations in scenic areas may well give consideration to another branch of the Great North of Scotland Railway Co.'s highway transport service, namely the operation of a motor bus line for tourist traffic from Aberdeen through the lake region of northern Scotland.

The short line railroads, in many cases, are faced with the alternative of suspending steam railroad passenger or freight service or both due to the high cost of operation and maintenance and the low revenues received or of remodeling their transportation systems.

Several methods have been suggested in order that the returns on the investment may be materially increased.

Gasoline Motor Rail Car.

The gasoline motor rail car appears to have passed the experimental stage. The utilization of this vehicle on short line railways for the transportation of passengers, express packages and l.c.l. freight is a logical economic evolution of railroad transportation methods. The development of feeder service as way stations and extensions of motor rail car service at terminals by the utilization of motor truck and motor bus lines appears logical under favorable operating conditions.

Some short-line railroads may consider it advisable to replace the track with a pavement and operate their private right of way for the use of their own trucks and buses or as a toll road or a combination thereof.

In connection with some branches of highway transport, the railroad has certain economic advantages from the standpoint of overhead expenses. A traffic department is a part of its organization and may be readily expanded to supervise its highway transport activities. The basic principles of management in an efficient railroad traffic department do not have to be developed and the economic fundamentals of the relation between operating expenses and revenues do not have to be acquired at the expansion of either business failures or costly experience. The establishment of highway transport clearing houses and warehouses will usually mean not more than a rearrangement of its shipping and receiving platforms and buildings with an expansion of such facilities as the growth of its highway transport division demands. Garages and repair shops may be combined with locomotive and car sheds. Generally idle real estate is available for administrative offices, storage tanks and other structures as they are needed.

British Railways' Bill.

The future development of the utilization of highway transport by railroads should receive careful consideration from the standpoint of the efficient development of transportation by railway and highway. Railways may seek powers to operate highway transport both in connection with rail transportation and independent thereof. The present Railways Bill, now before the British Parliament, said to be supported by the Northwestern and Midland Railway group, contemplates an extensive development of the utilization of highway transport by railroads throughout the British Empire with the object of securing powers to conduct highway transport of commodities carried or to be carried by railroads or independent thereof. The public should bear in mind that some railroads may have ulterior motives in seeking to secure the right to operate highway transport. An unfortunate retardation of the development of efficient highway transport in a given community might be accomplished by a railroad by elimination of competition either through the control of routes by franchises or through cut throat haulage prices. If franchises are to be granted railroads for the development of highway transport services, such franchises must be safeguarded by regulations covering the service to be rendered.

The probable rapid development of the utilization of highway transport by steam and electric railroads and the fact that two-thirds of the state legislatures will be in session in the spring of 1923 leads to the conclusion that this Association should have an active National Committee, composed of steam and electric railway officials, highway transport operators, motor vehicle manufacturers, economists and engineers whose duty should be to formulate conclusions relative to the opportunities and rights of steam and electric railroads to function as operators of highway transport.

Committees representing Walkerville and Ford Councils last Friday reached an agreement on plans to amalgamate the two border towns. Solicitors of municipalities will be instructed to draft terms of the merger, which will be discussed at the next meeting of the committees before being submitted to a vote of the people.

Legislation to authorize the purchase and operation of the Toronto Suburban Railway Co. by the Hydro-Electric Power Commission on behalf of the City of Toronto, was introduced in the Legislature last Friday by Premier Drury.

Highland Creek viaduct, near West Hill, Ont., being built by the Ontario Government, will be 666 ft. 6 in. long and will cost about \$140,000. The height from the water level to the floor of the bridge will be 92 ft. 6 in. The structure is to be 42 ft. in width, with one six-ft. sidewalk. The floor will be of steel and concrete and will have solid abutments. The bridge will be supported by three steel towers on concrete pedestals.

CAUSES OF FAILURE IN CAST IRON PIPE*

Metropolitan Water Board's Pipe Tests — Analysis of Boston, St. John and Hartford Pipe — Relation Between Flexure and Breaking Load Should be Fixed

By F. A. McInnis

Division Engineer, Public Works Department, Water Division, Boston, Mass.

DURING the past twelve years, in Boston, nineteen failures of cast iron water pipe, 16 in. to 48 in. in diameter, have occurred; nine of them being due to settlement upon an unyielding support, three to accident, two to freezing, one to imperfect casting, two to demoralization of metal in "bad ground," while in two cases no reason for failure was apparent. As usual the fatal rigid bearing was the greatest offender; eternal vigilance, expressed in unrelenting inspection on the part of the Water Department, will alone minimize the danger from this cause in city streets. The pipe may be originally laid in a safe location, yet disaster may follow from the subsequent construction of sewers, conduits, subways, etc., under or adjoining it. All the failures of this kind mentioned above were due to settlement upon structures built after the pipe was laid, and all might have been avoided had reasonable care been taken to provide the necessary clearance around the pipe.

Quality of Pipe

It is not my intention to discuss the damage resulting from electrolysis, bad ground, improper filling, undue external loading, settlement, etc., nor to go at length into the imperative necessity that cast iron pipe be well made, properly laid and carefully protected from adverse conditions after being put in service. Much might be written on these points but I will briefly call attention to a probable cause of failure neither so much discussed or so appreciated; I refer to the quality of the pipe iron. This vital feature has not been sufficiently safeguarded in our specifications which require the test bars to support a centre load of 1900 lb. (N.E.W.V.) or 2,000 lb. (A.M.W.V.) and to show a deflection of 3 in. before breaking. The weak spot in these requirements lies in the fact that no direct connection is made between the loading and deflection with the result that in many cases the test bars do not show 3 in. deflection until the load is in excess of 1900 or 2000 lb., often times largely in excess. 2183 tests bars broken by the Metropolitan Water Board of Massachusetts during the past nine years give the following results:

3 bars showed .18 in. deflection at 1900 lb.
5 bars showed .19 in. deflection at 1900 lb.
33 bars or 15% of total number showed .20 to .21 in. deflection at 1900 lb.
389 bars or 18.0% of total number showed .22 in. to .24 in. deflection at 1900 lb.
229 bars or 10.5% of total number showed .25 in. to .28 in. deflection at 1900 lb.
437 bars or 20.0% of total number showed .28 in. to .30 in. deflection at 1900 lb.
905 bars or 41.5% of total showed less than .30 in. deflection at 1900 lb.
456 bars or 21.0% of total number showed .31 to .34 in. deflection at 1900 lb.
490 bars or 22.5% of total number showed .35 to .37 in. deflection at 1900 lb.
136 bars or 6.0% of total number showed .38 to .40 in. deflection at 1900 lb.
3 bars showed .42 in. deflection at 1900 lb.
2 bars showed .42 in. deflection at 1900 lb.

These results evidence metal of widely different quality. With a test bar deflection at 1900 lb. ranging from .18 to .43 in., we may safely conclude that the iron varied from "very hard" to "very soft"; omitting the extreme

cases the deflection at 1900 lb. ranged from .22 in. to .37 in., a condition far from satisfactory.

Test Bar Deflection

Water pipe iron, to secure the required resiliency and the necessary strength should show a test bar deflection of approximately .3 in. at 2000 lb. with an increased deflection of approximately .03 in. for each increase in load of 200 lb. above 2000 lb.

The question naturally arises, why not specify the composition of the iron, stating just what percentage of the different elements will be allowed, as is done in the manufacture of steel? There are practical objections to this course based on the differences in ores and coke throughout the country, on the necessarily different composition of thick and thin pipe, on the practical difficulty of making such a provision effective and on the possible undesirability of specifying both physical characteristics and composition of metal, etc. The writer, however, believes that the permissible sulphur content at least should be specified; with this provision, together with a logical relation between flexure and breaking load fixed in the test bar requirement, a long step forward towards uniform and satisfactory iron will have been taken.

Boston Water Dept. Practice

It has been the practice of the Boston Water Department to analyze the metal in a broken or cracked pipe, and the following determinations represent some of the results obtained over a period of approximately twenty years, many other analyses, entirely above suspicion, having been in the same period:

Pipe broken in middle of length when unloading from truck.

Year	Size	Sil.	Sul.	Man.	Phos.	C.C.	G.C.
1920	8 in.	1.32	.177	.85	.64	.82	2.7

Sleeve broken when water was turned on.

Year	Size	Sil.	Sul.	Man.	Phos.	C.C.	G.C.
1919	12 in.	1.66	.205	.28	.75	1.38	1.71

Pipe broken when water was turned on.

Year	Size	Sil.	Sul.	Man.	Phos.	C.C.	G.C.
1918	8 in.	1.74	.233	.45	.83	1.3	2.20

Pipe broken in transit from foundry.

Year	Size	Sil.	Sul.	Man.	Phos.	C.C.	G.C.
1915	10 in.	1.37	.171	.57	.75	.72	2.68

Pipe broken in transit from foundry.

Year	Size	Sil.	Sul.	Man.	Phos.	C.C.	G.C.
1915	12 in.	1.65	.185	.48	.75	.69	2.7

Pipe broken in transit from foundry.

Year	Size	Sil.	Sul.	Man.	Phos.	C.C.	G.C.
1915	10 in.	1.35	.133	.43	.79	.61	2.74

Pipe broken in transit from foundry.

Year	Size	Sil.	Sul.	Man.	Phos.	C.C.	G.C.
1915		1.33	1.21	.40	.80	.64	2.7

Pipe broken in transit from foundry.

Year	Size	Sil.	Sul.	Man.	Phos.	C.C.	G.C.
1915		1.47	1.21	.34	.80	.33	2.4

Six breaks occurred between October 19 and December 5, 1900, in a 48-in. supply main of the Boston system, laid in 1869, following an increase in working pressure of 15 lb. The analyses of the iron in these cases were as follows:

	Sil.	Sul.	Man.	Phos.	C.C.	G.C.
1	4.05	.07	.90	1.00	.04	2.38
2	4.25	.017	.90	.79	.08	3.56
3	4.10	.037	.83	.86	.08	2.85
4	4.18	.027	.93	.90	.08	3.06
5	4.27	.051	.86	.928	.06	2.62

S. John, N.B., Experience

In St. John, N.B., 1916-17, one of the two 34-in. mains supplying the city failed several times, as it had been in the habit of doing at intervals in the past. The pipe was

*Paper read at the 42nd Annual Convention of the American Water Works Association, Philadelphia, May 15-19, 1922.

cast in England many years ago. The following are analyses of the metal in the broken pipe in three cases:

	Sil.	Sul.	Man.	Phos.	C.C.	G.C.
1	2.94	.035	1.08	.99	.56	2.59
2	2.36	.068	1.22	1.00	.51	2.79
3	2.80	.03	1.05	.90	.58	2.80

The following analyses of a 24-in. main broken in the Hartford, Conn., system in 1921, has come to my attention:

	Sil.	Sul.	Man.	Phos.	C.C.	G.C.
1	2.22	.094	.36	1.39	.07	2.92
2	2.61	.10	.23	1.86	.03	2.77

Some of these determinations can safely be termed "horrible examples"; witness the Boston 48 in. with C.C. .04 Sil. 4.05 and the Hartford 24 in. with C.C. .03 Phos. 1.86; one of them, the St. John 24 in., is in the freak class; the remainder, particularly those in which the sulphur content is abnormally high, warrant the conclusion that the quality of the iron was a contributing if not the direct factor in the failure of the pipe. The broken pipes were cast in main pipe foundries throughout the United States with two exceptions, namely, the St. John 24 in. which was made in England, and the sleeve broken in 1915, which was cast in a small jobbing foundry in Boston. As a rule two specimen pieces, taken from different parts of the broken pipe, were submitted for analysis and in no case was a substantially different result obtained from the bell and spigot end of the pipe.

Cast iron pipe is not a homogeneous material. When pig iron and scrap iron are melted and made into water pipe, the resulting cast iron must vary to some extent in its physical characteristics, owing to differences in the material used in the cupola and to the methods employed in moulding, cooling, etc. The process of manufacture demands a high degree of skill and oversight if the product is to maintain the uniform quality desired. That this condition does not always exist is apparent to those familiar with the output of cast iron water pipe. There are notable exceptions where this criticism does not apply, but on the whole it would appear that the general standard of manufacture might be raised to the advantage alike of maker and consumer, to the end that a well coated pipe of uniform and sufficient strength, equal at least to the best of the present product, may be absolutely depended upon.

The writer is one of those who believe in cast iron pipe for water works distribution and supply systems, recognizing it to be best suited to meet the conditions usually found, and as its friend, advocates the application of more scientific methods in its manufacture than now obtains in many cases.

The U. S. Bureau of Standards, in co-operation with interested manufacturers, is to carry out an investigation of stucco bases made of woven wire cloth and expanded metal lath. It is expected that 3 types of base now in general use will be applied over sheathed construction, and the performance of the various panels will be noted and analyzed.

A complete survey of iron ore resources of British Columbia is to be commenced this summer. The Canadian geological survey branch has agreed to undertake this important work in co-operation with the provincial department of mines. The object is to obtain conclusive information as to the possibility of this province supporting a large capacity iron and steel plant.

The Niagara Peninsula Branch of the Engineering Institute of Canada held their last monthly meeting for the season in the Engineers' Club, Thorold, on May 17 with a large attendance. The speaker of the evening was Lieut.-Colonel H. C. Boyden of the Portland Cement Association, Chicago. Col. Boyden spoke of the most modern developments in the manufacture and use of concrete.

SOME METHODS OF FIRE PREVENTION*

By T. S. Glover

PRIMITIVE people have made of fire a god. To us it is in danger of becoming a devil. One of the outward signs that distinguished man from the beasts of the field is the use of fire, and without it our civilization would have been impossible. The uses of fire are obvious, but the abuses of it are so little realized by the vast majority of people, that today we have special departments whose business is solely to shake us from our blissful slumbers, and hammer cold facts into our heads about the tremendous loss of life and property that is now, hourly, going on round about us. The expression "hammer" is used advisedly, as any milder form of persuasion is useless, and can never succeed in breaking through our attitude of indifference to this glaring evil.

A Personal Problem.

Those of us who have considered the human make-up (and which of us has not) are eager to admit the beauty of self-control, of the strong and healthy mind that leads. We admire the great efforts that the engineer has made in controlling and directing Nature by dams, canals and all the many works he has designed. And yet, in the face of this lawless devil, that tears madly through our land, respecting neither low nor high, waving his red torch of destruction, we placidly go about our business, hoping that we at least may be spared. Then perhaps we see a fire, or read about some new triumph of the demon of fire, and wonder why someone does not do something to prevent this waste. When we have reached this point there is some hope of improvement. In the particular circumstances in which each one of us is placed there is opportunity to awaken people to a sense of the futility of this fire waste, and it is only when the great mass of public opinion decides that this shall not be that it will cease. There are men with brains to design fireproof structures if we want them. Till we want them enough to be willing to pay the comparatively small extra cost the same orgy will continue.

We therefore want to prevent loss by fire. The word "prevent" means "coming before," or, as we should say, "getting ahead of." Our fire demon is endowed with intelligence of a high order, but nevertheless we have sufficient accumulated knowledge to be able to forestall his machinations, if we really set out to do it. Our frame house, lit by kerosene lamps, is an easy mark for him, and with what fiendish delight does he pounce on the little child playing by the unguarded fireplace. The airy tossing of our cigarette end into space, or what is more likely, into the waste-paper basket, is as good an opening for him as that offered by the man who looks for a gas leak with a candle. It is not so much technical knowledge we need, as ordinary common sense and a stiffening of our mental and moral fibre. We are so used to the comforts and conveniences of our modern life that we see no reason why we need go to a little trouble in the small things of our daily round.

Value of Education

In a recent address before the Ontario Fire Prevention League, Dr. H. J. Cody stated that in his opinion the best way to bring about a great national advance or induce a beneficial national change, was to deal with the children. Train the child, and then, as the twig is turned, so will the tree be. It is far better to deal with the children than with the adult.

This means education, not by the teaching of a long list of "don'ts" so much as by the inculcation of strong positive principles, such as cleanliness, law, order, duty and restraint, obedience, discipline. The child with a clear and well-ordered mind will instinctively refrain from un-

*From Transactions, University of Toronto Engineering Society, being an essay in the recent competition conducted in the Faculty of Applied Science, for prizes offered by the Fire Marshall of Ontario.

tidy and slack practices, such as letting off squibs in the woodshed. He will know enough to go out into a field for the fireworks season. To quote Dr. Cody again, "The two great enemies of property and of fire prevention work are probably carelessness and uncleanness; both of these have their roots in certain features of human nature. They are not merely material accidents, but are related to personality, and so, being related to personality, can be dealt with by the processes of reason and education along proper lines."

Facts are very potent, solid arguments, and if there are any who need convincing of the magnitude of the danger, let them ponder the following. In the United States and Canada, estimates show a casualty list of twelve thousand persons killed each year by fire. As in war, the deaths are not nearly equal to the injured, so that thirty thousand casualties a year from fire is no exaggerated three hundred million dollars. Much of this loss is foodstuffs, and necessities of life, a waste which is positively criminal. And who is responsible? In some cases the builders and architects, but in far more cases some foolish and careless person who handles fire in the form of matches, burning tobacco, and a hundred other forms. Those who have investigated the facts closely tell us that in Europe conditions are not nearly so bad. The reason is that the people have been educated, and know the dangers of fire, and the precautionary measures to be adopted against it. They realize that their country's prosperity depends on the efficiency of its people and industrial plants, and that the matter is not merely one which concerns insurance companies and fire brigades, but that it is the concern of each member of the community.

In this country the recent efforts of the Fire Prevention League have resulted in a very marked decrease in fire losses. In Ontario, during the first six months of 1919, a reduction of 40 per cent. was effected—proof that the educational methods used were sound.

Defective Construction

Assuming now that the sympathy and co-operation of the large body of loyal citizens has been enlisted, let us turn to examine the responsibility of the structural engineer in the matter of fire prevention. Competent authorities state that the largest single factor contributing to the excessive fire waste in Canada is the indiscriminate use of wood for structural purposes. Out of possibly two million buildings, less than one-tenth of one per cent. has been built with proper consideration of fire safety. Nearly 70% of our buildings are of frame construction, and the majority of our brick buildings are inadequately protected against fire. It must, therefore, necessarily be a long time before the effect of more stringent building regulations will be felt and the problem consequently becomes not merely one of building new fireproof structures, but of remodelling existing ones so as to give a much greater factor of safety against fire.

Comparison of fire losses and of structural conditions in Canada and Europe leads to the conclusion that a radical change in building methods is fundamental to the curtailment of Canada's fire losses. Serious fires in Europe are exceptional occurrences, and conflagrations are almost unknown now. The fire departments in the principal European cities are certainly no better than ours, and in the smaller places, comparison would be ludicrous. Their greater immunity from destructive fires is undoubtedly due in large measure to superior construction.

A lack of thoroughness marks a large amount of our Canadian building, due to our giving way to the modern cry for speed. This leads to insufficient supervision and carelessness, not in the matter of structural safety, but of safety against fire. The responsibility for these conditions may be equally divided between the owners, architects, contractors and public authorities. Speculation and the desire for large returns by investors have been the cause of much poor construction in Canada. Efficient construction requires time.

Objection has been frequently made to the passage of ordinances requiring brick construction, on the ground that

it would prove a hardship to builders by compelling a larger initial expenditure. After careful examination of the merits of this argument, it has been found that the additional cost in Canada of solid construction is so small that the prohibition of frame buildings, at least in cities and towns, would involve no real hardship.

The relation of construction to the safety of the lives of those who occupy buildings is self-evident. The danger to human life is influenced by (1) the material used in construction, (2) the design, (3) the facilities for escape, and (4) the physical and mental condition of the occupants. It is clear that the materials should be incombustible, and be employed in such manner as to overcome any inherent defects or weaknesses. Unfortunately, a building, even when constructed of fire-resistant material, and equipped with every safety feature and device, may be filled with inflammable and combustible contents, capable of generating gases, smoke and heat sufficient to destroy the lives of the occupants. Well designed and constructed fire resistant walls will, however, confine a fire to the space in which it originates.

The safety of a building is largely influenced by its design. The maximum separation of the exits, the safe enclosure of the stairways, the proper introduction of fire walls and the character and degree of the fire protection are all important details. In order to secure economy of design it is necessary that the purposes and uses of the building should be definitely known. Thus, the correct amount of fire protection may be provided against the exterior fire hazard, and, by dividing walls or partitions, fire doors and fire-extinguishing apparatus and equipment, protection may be provided internally.

Value of Fire Walls

The usual means of exit are (1) elevators, (2) outside fire escapes, (3) stairways, and (4) the fire-wall. There are only two kinds of safe exits—the enclosed fireproof stairway and the fire-wall—but the former has serious limitations and is not suitable for crowded buildings. The only real and practical solution of the problem of safety in buildings is a bi-sectional fire-wall. It is, moreover, the least expensive solution of the problem if properly and economically applied. There is, unfortunately, a widespread prejudice against the fire-wall, but this is largely due to the lack of knowledge of the manner of its application to the life hazard.

Its merits and advantages as a safeguard and protection to property have long been recognized by underwriters. Where it is introduced, the conditions in buildings are so changed that large economies can be made in the cost of additional exit facilities. In most cases this saving more than offsets the entire cost of the fire-wall and materially reduces the total cost of the building. There should be at least one stairway and one elevator on each side of the fire-wall and the wall should have at least two openings in it at as great a distance from each other as practicable, and both should be closed by standard fire-doors.

It is improbable that a fire will occur on both sides of the fire-wall simultaneously. Should it occur on one side, the people on that side would pass through the doorways in the firewall, close the doors after them and be perfectly safe. The half of the building in which the fire occurs can usually be emptied in less than a minute if there are not more than 300 people on each floor, and an average of 150 have to pass through the doorways. If the principle of the horizontal escape presented by the fire-wall is correctly applied in new buildings, a most satisfactory method of securing safety at comparatively small expense will be obtained.

The minute details of this work afford material for a long course of study in themselves, and the engineer has first of all, in designing any structure, to consider its strength to bear the load expected of it. But this does not imply an absolute disregard of the principles of fire protection. On the contrary, a closer study of such principles is becoming a necessity in our engineering colleges, if we are to proceed in the campaign for education in fire prevention equally at all points of the line.

ONTARIO PROVINCIAL HIGHWAYS*

By George Hogarth,

Chief Engineer of Highways, Department of Public Works,
Ontario.

ONTARIO has a system of provincial highways 1,812 miles in length which joins every city in the southern portion of the province. These roads threading through the counties of older Ontario, serve as main routes of travel between distant points and at the same time are of benefit to local district market centres. Roads in Ontario are supervised by various authorities, and in order to give a clear view of the position of the provincial highways in the road development program, a short description of the different kinds of roads is necessary.

In the original surveys of townships, road allowances were left as concession lines, or side lines, around blocks of land, and the township council has authority over such roads which it builds and maintains. The province to aid the townships with the work grants a bonus of 20% of the cost of the work.

Throughout the counties there are many roads which serve as main market roads to towns, cities, and shipping points. Such roads are of more importance to the community than the township road, require better construction, greater width and stronger surface, and the counties have, therefore, been authorized to assume and construct a system of county roads. Usually, about 15% of the road mileage in the county is taken as county roads and towards the cost the Government contributes 40% of the cost of construction and maintenance.

Classification of Provincial Highways.

Should some of the roads taken as county roads be important thoroughfares leading to towns and cities, or main routes through a county, they may be designated provincial county roads, in which case the government contributes 60% of the cost of construction and maintenance.

In the immediate vicinity of cities, all main roads require special attention to resist the heavy traffic, and in the case of county roads for a distance from the city, a commission may be appointed by the county and the city to have charge of and build such main highways. The highways assumed are known as county suburban roads and are paid for, 30% by the city and county, and 40% by the Government. Very important suburban roads may be designated provincial county suburban roads, in which case the city and county each pay 20% and the government 60% of the cost of the work.

On provincial highways, 80% of the cost of the work, together with all overhead charges and land required, is paid by the government, and 20% by the county in which the road is situated. In the vicinity of cities, a certain mileage of provincial highways may be designated provincial suburban, in which case the city and county each pay 20% of the cost, and the government 60%. Provincial highways are not designated entirely through towns but only extend into the municipality where the road is in front of farm lands. Where the continuation of a provincial highway passes through the business section of a town, the government pays 40% of the cost of the central 20 ft. of pavement laid by the town on the business street.

It will be readily seen that with the above system in operation, those roads requiring attention because of heavy and important traffic are so provided for, that every facility for proper construction and maintenance is given.

The provincial county suburban roads, provincial suburban and provincial highways are all built to a high standard, with paved widths of 18 or 20 ft., with a full top width of road of 30 ft., and with adequate and effective drainage to protect the investment in surface. In addition, the provincial highway cross section provides a space for

sidewalks on each side of the road, proper space for public services, such as rural free delivery post boxes, telephone, telegraph and power poles, as well as a location for underground services, water and gas.

The roadway portion of provincial highways is surfaced with material suitable for the traffic passing over it. Should the traffic be medium, a gravel road well drained and maintained, gives an economical surface, while for heavier traffic oiled macadam or penetrator surfaces or pavements, such as asphaltic concrete or cement concrete, are provided. Because of the fact that the heaviest of traffic is found just outside cities, it has been found necessary in many cases to construct pavements as fast as ruling conditions permit, while on sections remote from cities, ditching operations, gravelling of long stretches and the bringing of the entire system up to a uniform standard are carefully attended to. In the year 1921, the Department of Public Highways graded 70 miles of road, gravelled 120 miles, placed macadam base on 33 miles, constructed finished macadam on 40 miles, bituminous macadam on 17 miles, asphaltic concrete on 20 1/2 miles, and cement concrete on 25 miles, besides building 1,200 culverts and bridges.

To build a gravel road properly requires a dry roadway surface which in practically any location can be obtained by digging a ditch on each side of the travelled way. After the earth has been properly levelled and trimmed, a light coating of gravel about 4 in. in depth and 8 to 10 ft. wide can be rapidly spread. This first layer should be carefully levelled and all stones raked ahead so as to be buried under succeeding loads of gravel. While gravelling progresses, the surface of portions completed should be kept smooth by means of the log drag, so that as the material is compacted it will be smooth for traffic. After the first layer of gravel has been consolidated in place, subsequent layers may be added as required, but in all cases care should be taken to see that the gravel is spread thinly to a depth of not more than 2 in. Such a depth, properly spread and dragged and applied, if needed, spring and fall, will give excellent results. Gravel roads are readily built because over a large portion of Southern Ontario good road building gravel can be obtained on or close to the road and the cheapest of road building methods, intelligently applied, will give untold satisfaction.

Macadam.

Macadam roads, being built of crushed stone, are usually desirable where traffic is heavy and where field stone or quarry stone can be easily obtained. In sections of the county where bed rock does not exist, field stone may be gathered into piles convenient for crushing, and portable crushers used to crack the stone to proper size.

In localities well served by railways and having commercial crushed stone available at reasonable rates, such material can be used to construct a two-course macadam, having large stone of about 4-in. size in the base course, and 2-in. stone in the top course. The lower course is usually 5 or 6 in. thick after compression and top course 4 in. thick after compression. Surfaces of macadam roads are built with a crown of 1/4 to 3/8-in. per foot so as to give sufficient drainage.

Bituminous macadam surface consists of a depth of 2-in. stone about 3 1/2-in. in thickness, into which hot tar or asphalt is forced under pressure. The stone is carefully levelled and may be given a light rolling before penetrating. If tar is used it is heated to about 250 deg. F. and if asphalt, to about 350 deg. F. In the first application, about 1 1/2 gal. of bitumen per sq. yd. is used, and while the material is still hot and soft, stone chips are spread rapidly over the road surface. The roller is then passed over, a second light coat of bitumen applied at a rate of about 1/2 gal. per sq. yd., then a light coat of stone chips applied and, after a thorough rolling, the roadway may be opened to traffic.

Asphaltic concrete surface is laid in two courses each 1 1/2 in. thick, on either a good macadam or concrete foundation. The lower course of the mix uses sand and coarse stone up to about 1/2-in. in size, while the top course may

*Address delivered before the Civil Club, University of Toronto.

contain only a well graded sand. The upper or lower course is mixed separately in an asphaltic mixing plant and about 11% of asphalt is sufficient to give good results. Such pavements will carry the heaviest of traffic and give service over a period of years.

Concrete pavements may be constructed of cement, sand and good gravel or crushed stone in the proportions of 1 part of cement to $1\frac{1}{2}$ parts sand to 3 parts gravel or stone. The thickness at the sides is usually 6 in. and $8\frac{1}{2}$ in. in the centre.

Transverse expansion joints may be left every 50 ft. and in some cases a longitudinal centre joint may be desirable. Good results under heavy service conditions may be confidently expected from any well laid concrete pavement.

Structures.

Structures on provincial highways are built to carry Class C loading, the concentrated load of which is a 20-ton road roller. Spans of from 2 to 20 ft. are built of concrete with flat slab reinforced top. Longer spans are steel girders or trusses. The clear width of roadway is 24 ft., or greater, if special conditions demand, and if the bridge is in or near a large centre, one or more sidewalks 6 ft. in clear width are provided. All culverts are built of such a length that the full 30 ft. of top width of road can be placed between the end walls.

Where excessive grading is not required, the maximum grade on the provincial highways is 5%, but in exceptional cases this may be increased to 7%, which is as steep as any highway grade can safely be.

Every effort is being put forward to make the highways attractive by tree planting and attention to the roadside so that people will be drawn to the main roads and tourist traffic be encouraged as it is one source of revenue needing development.

The highways entering the cities are being attended to immediately and surfaces completed so as to serve those portions of the system which have the heaviest traffic. To finish such pavements requires, in many cases, bridges, and new locations for main roads to give direct access to large arteries of travel in the cities.

The highways now completed are giving efficient service to sections of the country which urgently required rapid transportation, and as fast as public opinion and finances permit, the benefits of such construction are being given to an ever widening area of the Province of Ontario.

POWER LOSS IN AUTO TIRES.

UNITED States Bureau of Standards has a rubber laboratory equipped with a special dynamometer for determining, among other things, the power loss in automobile tires. A great many of the standard makes of tires have been tested on this dynamometer, and valuable data are being obtained concerning the percentage of the power of an automobile engine which is absorbed by the tires under various conditions.

Some interesting figures have already been secured as a result of this work. For instance, an average 4 in. fabric tire, under conditions of normal load and air pressure, will absorb approximately .90 h.p. due to rolling resistance at a speed of 25 miles per hour. Under the same conditions, the power loss in a 4 in. cord tire is approximately .60 h.p., while a 5 in. cord tire represents a loss of 1.20 h.p. The extent to which different parts of the tire contribute to the power loss has also been investigated. It is estimated that from 80 to 85% of this loss is in the carcass, the tread contributes 10 to 15%, and the tube probably less than 5%.

Under the auspices of the Windsor branch of the Engineering Institute of Canada, Colonel H. C. Boyden, of the Portland Cement Association, Chicago, addressed a fair sized audience on May 19 in the Windsor Collegiate auditorium, on "Recent Developments of Concrete."

CANADIAN ENGINEERING STANDARDS ASSOCIATION

SEVENTH meeting of the Main Committee of the Association was held in Ottawa at the offices of the Association on April 24th. H. H. Vaughan in the chair. This meeting being the first held since the death of Sir John Kennedy, the resolution of condolence which was passed by the Committee in November last was reported as having been forwarded to Lady Kennedy, and the chairman and other members of the Committee spoke feelingly of the loss sustained by the Association through Sir John's death.

The following changes in the personnel renominations of members of the main committee were reported:

Sir Alexander Bertram, nominated by the Engineering Institute of Canada, replacing W. F. Tye.

C. W. Lefebvre, nominated by the Ecole Polytechnique, replacing Arthur Surveyer.

Dr. L. A. Herdt, renominated by McGill University.

Dr. R. A. Ross, renominated by the Research Council. Prof. P. Gillespie, renominated by the University of Toronto.

T. F. Sutherland, renominated by the Canadian Institute of Mining and Metallurgy.

A. R. Goldie, renominated by the Canadian Manufacturers' Association.

W. A. Bowden having been nominated as a member of the main committee by the Department of Railways and Canals, replacing Col. C. H. Monsarrat, it was decided to co-opt Col. Monsarrat as a member so as to retain his services on the Committee.

A number of gentlemen serving on various Committees of the Association were elected to membership of the Association.

Work of the Association.

The report by the Secretary, R. J. Durley, on the work and progress of the Association up to March 31 was laid before the Committee and approved for distribution to members of the Association.

Discussion followed on various points of interest among which the following may be mentioned:

As regards the work of the sub-committee on the Canadian Electrical Code it was decided to forward to the Minister of Trade and Commerce a memorandum outlining the present situation in regard to this question, and requesting him to convene a meeting of representatives of the various provincial governments, to discuss the possibility of interprovincial agreement and to acquaint the provincial governments with the difficulties now experienced by the Industry. The following resolution was unanimously passed:

"RESOLVED that the Memorandum on the proposed Canadian Electrical Code be approved, and that the Secretary be directed to forward it to the Minister of Trade and Commerce, calling his attention to the unsatisfactory situation at present existing in Canada due to the lack of uniformity in the requirements for electrical appliances and construction in the various provinces, and requesting the minister to consider the advisability of calling a conference of representatives of all the provincial governments with this Association to discuss the matter with the view of obtaining interprovincial agreement and action."

On the suggestion of Geo. A. Mountain it was decided to form a committee to consider the desirability of formulating standards for crossings of water and other pipe lines under railway lines.

As a result of a communication from the sub-committee on "Concrete and Reinforced Concrete" the committee discussed the best means of dealing with the "Standardization of Sieves and Screens" in Canada. It was pointed out that standards of this kind have been adopted both in England and in the United States, and that the question is of great interest not only to persons interested in cement and concrete but also to the mining and metallurgical industries, to those dealing with road materials, broken stone, etc., to industrial chemists, and others. It was decided that the formation of a committee to deal with this

question should be proceeded with, and the matter was referred to the executive committee for action.

The secretary reported that in response to an invitation received from the American Engineering Standards Committee, John Murphy, electrical engineer, Board of Railway Commissioners, had acted as the representative of the C. E. S. A. in attending a conference held in New York to discuss the measures to be taken in the United States with a view of obtaining uniformity in specifications for overhead crossings of electric lines over railways. This question in Canada is largely under the jurisdiction of the Board of Railway Commissioners, and in order to obtain as far as possible an agreement between the requirements in force in Canada and those proposed in the United States, it has been arranged that the American proposals, before their adoption, shall be forwarded for consideration and comment to a C.E.S.A. committee which is to be organized for that purpose.

An invitation from the A.E.S.C. to take part in a conference regarding colours for traffic signals was received. It was decided to thank the A.E.S.C. for this invitation, and to enquire whether a method of dealing with the matter similar to that adopted in the case of overhead crossings would be satisfactory to the A.E.S.C.

A suggestion from H. C. Bertram of the John Bertram & Sons Co., Ltd., Dundas, Ont., was laid before the committee, outlining a scheme for the development of dimensional standards in Canada in connection with machine tool building. The committee expressed the opinion that action along the lines of Mr. Bertram's suggestion was very desirable, and the matter was referred to the chairman of the sectional committee on machine parts with a request for action if possible.

A letter from the Dutch Standards Committee was considered inquiring whether there is any objection on the part of the C.E.S.A. to the Dutch Standards Committee collecting and publishing the information regarding progress of work received periodically from the various national standardizing bodies, the collective scheme being then published periodically in the technical press. The secretary was directed to reply that so far as can at present be seen there is no objection to the Dutch Committee using the reports periodically furnished it by the C.E.S.A. in this way.

Election of Officers.

On the motion of Dr. J. B. Porter, seconded by Mr. Mountain, it was unanimously resolved that H. H. Vaughan be appointed Chairman of the C.E.S.A. in succession to the late Sir John Kennedy.

Mr. Vaughan expressed his willingness to accept the honour thus conferred, and pointed out that, in his view, the thing which was now most necessary for the success and growth of the C.E.S.A. was the encouragement of an effective interest in the work of the Association on the part of the manufacturing and industrial industries, this support being just as important and advantageous as the assistance rendered by engineers or scientific and technical societies.

The election of Mr. Vaughan as chairman requiring the appointment of a second vice-chairman, T. A. Russell and D. H. McDougall were unanimously elected as vice-chairmen, together with Dr. Porter as honorary secretary-treasurer, these gentlemen, with the chairman, forming the executive committee.

The meeting of the main committee was followed by the fourth Ordinary General Meeting of the Association, at which the annual report on the progress of work was presented, together with the auditor's financial statement for the year.

The annual convention of the National Lime Association will be held June 14-16, Hotel Statler, Cleveland, Ohio. The activities of this convention will deal with the technology of the uses of lime and the industrial problems of manufacturing and marketing lime.

Letter to the Editor

BEACH WATER WORKS PUMPING PLANT AT HAMILTON

Sir—The article on the above plant by Mr. R. de Bruno-Austin, in "The Canadian Engineer" for May 9, was most instructive. At a time, like the present, when almost all mechanical engineering appears to be at a stand-still, there is little else to do than study work done in the past so as to be in a better position to tackle jobs which we hope the future holds in store.

I take the following from the test figures on the steam-driven pumps: Steam pressure, 169.7 lb.; vacuum, 28.32 in.; barometer, 30.06; water, h.p., 725; pump efficiency, 80%; gearing efficiency, 98½%; steam consumption of turbine (actual) in lb. per hr., 11,901; steam consumption of air pump, 172; steam consumption of boiler feed pump, 403; total steam used per hr., 12,476; duty in million ft.-lb. per 1000 lb of steam, corrected for moisture, 117.16; allowance for moisture, 1.74%; actual moisture present, 2.37%. Deducting from the above figures and taking the moisture present into account the actual head of heat (or heat drop) available during the test was 330.5 B.T.U., so that the overall efficiency of the main unit, excluding the auxiliaries, was equal to $2547 \times 725 / 11,901 \times 330.5 = 47\%$, relatively to the Rankine cycle.

If the steam had been dry the available head of heat would have been 337 B.T.U., and, reducing the steam consumption from 11,901 lb. per hr. to 11,694 in accordance with the allowance for moisture, the efficiency by the formula above works out practically the same as in that case. The allowance for moisture, therefore, seems to have been a fair one.

Taking the heat of vaporization of the steam at the pressure given as being equal to 847 B.T.U., and neglecting the steam used by the air pump the loss of heat per hr. by the steam on its way to the engine room must have been equal to $.0237 \times 11,901 \times 847 = 239,000$ B.T.U., an excessive amount for 200 ft. of 6-in. piping, unless it was uncovered at the time.

This loss of heat excited the curiosity of the writer to see what effect, in this case, the addition of 100 deg. super-heat might have had. To obtain about the same duty as the guarantee the vacuum might be taken at 27½ in. In other words, let the heat drop take place higher up in the temperature-entropy diagram. For steam at a pressure of 170 lb. gauge and superheated 100 deg. the temperature would be 475.3 deg. Fah., and—neglecting the slightly greater radiation loss at the higher temperature—taking the same heat loss as before the temperature of the steam on arrival at the turbine stop valve would be $475.3 - (239,000 / 11,700 \times .58) = 440$ deg. This assumes 11,700 lb. of steam per hr. to be required by the turbine and air pump together under the new conditions and the mean specific heat to be .58. There is, then, more than enough superheat to see the steam through 200 ft. of piping without condensation. The available head of heat between the limits of 170 lb. at 440 deg. and 27½ in. vacuum is 334 B.T.U., a little less than that under the conditions of the guarantee.

Now, under the test conditions, the over-all efficiency of the main unit was equal to .47, which, divided by the product of the pump and gearing efficiencies, gives the turbine efficiency as .596 on the Rankine cycle, which is very good for a comparatively small turbine, especially with wet steam. It is fair to assume, then, that this turbine would have an efficiency of .605 when supplied with steam carrying a superheat of 65 deg. at the stop valve. Multiplying by the product of the pump and gearing efficiencies brings the over-all efficiency of the unit to .477. The steam per hr. required by the turbine only would then be equal to $2547 \times 725 / .477 \times 334 = 11,600$ lbs.

705 Colbrook Ave., Montreal, May 19.

BUILT TO ENDURE—Now booklet, published and distributed free on request, by the Koehring Co., Milwaukee, Wis., and Toronto, Ont.; 32 pages and cover. As a commercial booklet this publication is somewhat unique in lavish decoration and in the quality of materials and printing. The cover, embossed in blue and gold, bears out the title of the booklet, "Built to Endure," being of the highest quality of art stock and nearly as heavy and tough as leather. Heavy suede-finish coated paper is used, and the booklet is printed throughout in four colors, every page bearing some elaborate decoration. The text of the booklet is by Philip Koehring, president of the Koehring Co., and the etchings in color are by W. M. Young. The booklet is designed and produced by the Commercial Art Engraving Co., Chicago, under the direction of the advertising department of the Koehring Co., who describe the purpose of the booklet as follows: "In this booklet we have tried to pay our tribute to concrete—solely by describing and picturing a few of the wonders wrought in concrete. The romance of concrete is truly an epic—an epic in plastic stone, stretching thousands of years into the past, and who knows how many thousands of years into the future? From the Romans to the Americans; from slave-driven manual labor to the modern concrete-mixer; through all these years concrete has endured. Therefore, concrete has made a big place for itself in modern construction work; therefore, concrete finds new work to do daily; and, therefore, Koehring builds concrete mixers. Desiring to portray the romance of concrete, the beauty of concrete, and above all the permanency of concrete, we gathered together in one booklet, illustrations and facts concerning ancient and modern concrete structures built to endure." Throughout the booklet the ancient and modern present a striking parallel; an illustration and description of the Colosseum at Rome appears on one left-hand page, for instance, and on the right-hand page facing it is an illustration and description of the stadium used by the New York Yankees' Base-Ball Club; the Seine Bridge is contrasted with the Hell's Gate Bridge, the Pyramid of Cheops with the Black Hawk Monument, the Applan Way with the Lincoln Highway, the Roman Viaduct at Nîmes with the Tunkhannock Viaduct, and the Acropolis at Athens with the Bush Terminals.

UNDERWATER CUTTING OF METALS.

VALUABLE aid to the construction engineer and to those engaged in the work of salvage of sunken ships is afforded in the perfection within recent years of the underwater torch for the cutting of metals. Problems of this kind usually involve much difficulty and must be solved with the greatest haste, since in them the emergency factor predominates. It frequently happens that metal parts, or structures, such as pipes, cables and the like must be removed in order to permit reconstruction, and, in the salvaging of ships holes must often be cut through the sides to enable divers to enter. In cases where steel bridge wreckage must, in the interests of navigation, be removed, a cheap and rapid method of cutting away the distorted metal is most desirable.

The improved underwater cutting torch is not only simple in construction, but easy to operate. Something over ten years ago the Germans made use of such a device in the form of an oxy-acetylene flame contained in a cup-shaped nozzle. This device, however, could scarcely cope with thick metallic masses, or in very cold water, or at very great depth. Improvements were made upon it by the French, but in the past few years American inventors have been able to develop the apparatus still further. As now employed, it consists merely of a single carbon electrode pierced longitudinally by two parallel tubes through which a cutting gas is fed to the zone of the arc. When the current is turned on and the tip of the electrode placed a fraction of an inch from the metal to be cut, the torch comes into operation.

A striking use for this equipment in emergency work was recently described in the Scientific American. This

consisted in replacing a damaged section of 36-in. cast iron water pipe across the Narrows between Staten Island and the Borough of Brooklyn. A heavy spud of a dredge had been allowed to fall on the pipe and rupture it. This pipe was located 50 ft. below the surface and under 23 ft. of mud. After dredging operations had removed the overlying soil the torch was used to cut off the upper half of the bell of the damaged section and the entire bell of the adjacent section along a sloping cross section. This done, it was a simple matter to hoist the damaged pipe to the surface and replace it by another. The torch used was able to cut through the 1½-in. cast iron wall at the rate of four to six inches an hour, the cutting of the bell being of course much slower.

With this improved equipment for emergency repairs and salvage, it should be possible for engineers to undertake work which has hitherto been impracticable. It will undoubtedly mean the reduction of serious inconvenience to large populations when subaqueous water mains are put out of commission and the supply must be cut off until repairs are completed.

EXTENSION OF AUTOMATIC TRAIN CONTROL.

IN a recent order the Interstate Commerce Commission of the United States required 49 railroads to show cause why they should not install automatic train control equipment before July 1, 1924, on the sections of their lines where the traffic is most dense. This step was taken only after exhaustive study of the whole question of signal and control systems extending over 14 years. The engineers of the Commission have become convinced that automatic control is both practicable and necessary. It is not difficult to appreciate the force of the argument when the high percentage of the railway fatalities on this continent is considered.

While in the present condition of the railways in Canada no such order as this is likely to be made in the near future, from it the trend of progress is evident. It is not unlikely that when the railways have been placed on a sound operating basis that similar steps will be taken by those who direct the railways in this country.

PERSONALS

FRANK P. VAUGHAN, manager of the Vaughan Electric Co. Ltd., St. John, N.B., received the Honorary Degree of M.Sc., in electrical engineering from the University of New Brunswick, Fredericton, N.B., at Encaenia, May 18.

ROY PATTERSON, of Galt, Ont., who has been assistant to city engineer D. T. Black for the past 18 months, has left Galt and will reside in Thorold, having accepted a position with the Webster Construction Co., of London, Ont.

IRA W. MCCONNELL, vice-president of Dwight P. Robinson & Co., New York and Montreal, has returned home after a visit to Brazil, where he has been located since last September, in charge of the irrigation work which his company is doing for the Brazilian Government.

C. W. DILL, superintendent of highways for the Saskatchewan government, has severed his connection with the department after occupying the post for over three years. Mr. Dill is well known in engineering circles in the province. Only recently he was elected vice-president of the Saskatchewan branch Engineering Institute of Canada and about the same time was elected president of the Saskatchewan Civil Service Association.

H. G. DIMSDALE, engineer of the Lacombe Northwestern Railway, has been appointed highways commissioner for Alberta, under the new public highways act passed by the last legislature. He will take office, it is understood, at once and will carry on necessary investigation work during the summer and fall on the classification of roads, and establishment of highways, and other information preparatory for the act coming fully into force at the beginning

of 1923. Commissioner Dimsdale has already had a wide engineering experience in Alberta. He was chief of surveys on the Edmonton-Dunvegan and Alberta Great Waterways Railways in 1913-14, and was then bridge and road engineer for the Dominion Government at Waterton Lakes Park. From 1915 to 1919 he served with the Canadian expeditionary forces overseas, as captain in the 102nd battalion. On his return from the war he was superintendent and engineer of irrigation work for the Canada Land and Irrigation Co., and in the latter part of last year was appointed engineer for Lacombe Northwestern Railway.

OBITUARIES

HERMEGILDE DUFORT, a well known builder and contractor of Montreal, died at his home in that city on May 17, aged 71.

THOMAS C. ALLEN, a well known building contractor and former member of the Fredericton, N.B., city council, died in Bangor, Me., recently aged 66.

ECONOMIES TO HYDRO POWER USERS.

AUDITED figures summarizing the Hydro-electric business of five Ontario communities for the year 1921 have been given out by the Provincial Commission. Galt has a population of about 14,000; Fergus and Elora are well under 2,000 each while Rockwood and Brigidon are villages.

Galt became connected with the Hydro-electric system in May, 1911, and its first Hydro rates were only about half the charge before that date. These rates have been reduced from 5.3 cents to 1.8 cents for domestic lighting, and from 4.1 cents to 1.9 cents for commercial lighting. The industrial power rate has declined from \$17.77 to \$14.44. These reductions have had a direct money value to consumers of \$407,411.64. The load in 1912 was 425 h.p. For that reason the cost of delivered power has dropped from \$25 to \$21, despite increased generating costs at Niagara.

Fergus is 95 miles from Niagara Falls. Before the municipality began taking Hydro-electric energy in 1914 the kilowatt hour rate was 10 cents, with a meter rental of 25 cents per month. The first rates charged by the Provincial Commission averaged to consumers 6.8 cents domestic, 6.3 cents commercial, and \$29.25, per h.p. for industrial energy. Average rates last year were, respectively, 5.3 cents, 5.4 cents and \$23.17. The reductions have been made possible by the growing demand for service. The original load of 66.7 h.p. has increased to 185.1 h.p.

Elora paid before the advent of Hydro power 10 cents per k.w.h. with a monthly meter rental of 25 cents. The average Hydro-electric rates for 1915 were 7.4 cents and 7.1 cents, in 1921 they were 4.1 cents and 4.5 cents respectively. The industrial power rate is \$32.04. Through rate reductions authorized by the Provincial Commission the consumers in Elora have saved \$10,240.91. The load has grown from 49.3 to 197.5 h.p.

Rates in Rockwood have been successfully reduced since 1914, when they stood at an average of 8.8 cents per kilowatt hour. The present average is 6.4 cents for domestic lighting, 7.6c. for commercial lighting and \$28.17 per h.p. for industrial energy. The village is 88 miles from Niagara Falls and its population is only about 500.

Brigidon, with a population of about 500, is 234 miles from Niagara Falls and has been taking Hydro-electric energy since January, 1918. The original load of 21.9 h.p. has increased to 78.5. Former rates in the village averaged 15 cents per kilowatt hour.

The first rates quoted by the Hydro-Electric Power Commission averaged 9.5 cents for domestic lighting, the same for commercial lighting, and \$44.70 for industrial power. After four years' operation the rates are, respectively, 9.1 cents, 7.6 cents, and \$35.48. The saving to consumers even by these slight reductions has been \$1,738.

GEOLOGICAL FORMATION UNDER MCGILL UNIVERSITY

SOLID rock is being prospected for at various points on McGill University property at Montreal where buildings are to be erected during the course of the summer and fall. Six test pits have been sunk for this purpose. Four of them are on the lot at the southwest corner of Milton and University streets, where the new Mining, Electrical and Geological building is to be situated. Two others are in the "Hollow" between the Physics building and Sherbrooke Street, where the new gymnasium and residences are to be built. Another pit will also be sunk on this site.

An interesting fact is revealed by the work on the shafts at the corner of Milton and University Streets. In the pit nearest the mountain, the one on the north-west corner of the lot, bed-rock was reached at 14 ft. In the north-east pit, the one immediately at the corner of Milton and University streets, bed-rock was reached at 30 ft. In the south-west pit, near the Workman engineering shops, bed-rock was found at 33 ft. In the fourth pit, the workmen have reached a depth of 25 ft., and have not yet touched solid rock.

From these indications, it is evident that the site is directly on the edge of one of the "beaches" which geologists say form most of the territory of the central part of Montreal. The sudden descent from the 14-ft. pit to the 33-ft. one is proof that a cliff probably existed at this point at one time before the top soil was deposited. There is a succession of these beaches which lead in steps from the foot of Mount Royal to the Craig Street level, the formation of the territory between Craig Street and the river front not being quite so certainly established. The fall in level from Sherbrooke Street to St. Catharine Street, from Dorchester to Lagachetiere Street, and from that point to Craig Street, is due to the existence of these beaches which are hidden many feet beneath the surface by accumulated soil.

The pits in the "Hollow" where the students have played tennis for many years bring further proof of the location of the edge of one of the beaches. The north-east one behind the Forest Products' Laboratories, has been sunk to a depth of 29 ft. without any sign of bed-rock. The other one, to the south-west and near Sherbrooke Street, has been sunk to a depth of 39 ft. without encountering bed-rock. In both cases the presence of water has somewhat hampered operations, the workmen finding 3 or 4 ft. of water in the southwest pit every morning, and 13 or 14 ft. of water in the north-east one. Beneath the topsoil of loam and occasional pockets of clay and sand, the workmen reached a stratum of gravel and fine muddy sand, carrying a great deal of water. The gravel pebbles are very large, but smoothly polished. It is estimated that rock will be found at a depth between 50 and 60 ft. as the pits sunk for the piers of the McGill Union, which is immediately across the street, reached bed-rock at 60 ft.

Both the sites on which pits are being sunk are in the path of a stream which up till 50 or 60 years ago traversed the tract of land that James McGill bequeathed to found McGill College. This stream entered the property near the corner of Milton and University Streets, flowing towards the "Hollow."

The pits will be sunk until bed-rock is reached. They will then be used as piers for the new buildings. The University Street pits are being sunk by W. D. Lawrence and assistants, of the University engineering staff, while those near Sherbrooke Street are being worked by Fraser, Braco and Co. No shafts will be sunk for the Pathological building, which is to be built on University Street, above Pine Avenue, as solid rock is found at a depth of 2 ft. or 18 in. on this site.

At the annual meeting of the Quebec branch of the Engineering Institute of Canada, held on May 24 the following officers were elected: President, A. R. Decary; vice-president, A. B. Normand; secretary-treasurer, Hector Climon; Councillors, L. C. Dupuis and T. Rosseau.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand or proposed, contracts awarded, changes in staffs, etc.

TENDERS PENDING

The following tabulation is presented as a reminder to contractors in regard to tenders that are still pending, other than those reported in this issue. The word "Issue" refers to the issue of "Canadian Engineer" in which there appeared a notice giving details regarding the call for tenders.

Place of Work	Tenders		Issue
	Close		
Toronto, Ont., installation of one four-million Imperial gallon centrifugal pump at Island Pumping Station....	June 13	May 9	
Ottawa, Ont., various work on Civic Hospital	May 25,		
	30, June 1	May 9	
Waltham, Ont., construction of dam.....	June 1	May 9	
Nassau, New Providence, Bahamas, dredging	July 15	May 9	
Edenwold R. M., Sask., road work.....	June 5	May 16	
Brant Tp., steel bridge and abutments ..	June 2	May 23	
London, Ont., construction of bridge ..	May 31	May 23	
Revelstoke, B.C., construction of bridge	June 19	May 23	
Welland, Ont., construction of water-bound macadam road; for oil, asphalt, Tarvia or other preservative of waterbound macadam roads	June 5	May 23	
Westminster Junction, B.C., construction of steel highway bridge	June 10	May 23	
Saskatchewan, Province of, construction of earth road from Wroxton west, 8 miles	May 31	May 23	
Saskatchewan, Province of, construction of earth road from Esterhazy to Stockholm	May 31	May 23	
Toronto, Ont., laying and jointing of water pipes	June 6	May 23	
Cobourg, Ont., construction of addition to school	June 2	May 23	
Olinda, Ont., construction of school	June 1	May 23	
Powell River, B.C., construction of addition to school	May 31	May 23	
Toronto, Ont., work on various schools ..	June 7	May 23	
Mimico, Ont., concrete and asphalt pavements	June 5	May 23	
Winnipeg, Man., work on Canadian National Railways	May 31	May 23	
Aurora, Ont., erection of addition to High School	June 6	May 23	
Ford, Ont., erection of school	June 1	May 23	
Montreal, Que., various work in erection of Notre Dame Hospital, Sherbrooke St. East	May 31	May 23	
St. Catharines, Ont., Sections 3 and 4 combined, Welland Ship Canal	June 9	May 23	

BRIDGES, ROADS AND STREETS

Berthier, Que.—Contract for construction of the Railton bridge in steel and concrete has been awarded to the Kennedy Construction Co., Ltd., Shaughnessy Bldg., Montreal, at \$19,820.

Birch Cliff, Ont.—Tenders will be received by W. D. Annis, Clerk, Scarborough Township, until 12 o'clock noon, Monday, June 12, for the construction of concrete sidewalks, together with the necessary grading, on following

streets: Danforth Ave., 38,940 sq. ft.; Kingston Road, 27,328 sq. ft.; Kildonan Drive, 10,580 sq. ft.; Eastwood Ave., 6,522 sq. ft.; Birch Cliff Ave., 2,100 sq. ft.; Audrey Ave., 3,850 sq. ft.; Pine Grove Ave., 5,732 sq. ft.; Park St., 1,032 sq. ft. Contractors may tender on any or all of the contracts. Plans and specifications may be seen at office of Township Engineer, Bank of Commerce Building, Birch Cliff.

Brampton, Ont.—Tenders will be received until noon, June 1, for construction of 24-ft. reinforced beam bridge on County road at Castlemore. N. L. Powell, Road Supt. of Peel County, Brampton.

Brantford, Ont.—City Council instructed City Engineer F. P. Adams to report on the paving of Ave. Road, from St. Paul Ave. to the city limits.

Chatham, Ont.—Contracts for concrete base course awarded by Council as follows: Lowe St., 1,200 sq. yds., to Western Construction Co., Chatham, at 69c per sq. yd. of base (labor only), and 18c for curb; Wilson Ave., 2,158 sq. yds., Western Construction Co., at 71c per sq. yd. and 18c per lin. ft. of curb; Ursuline Ave., 3,866 sq. yds., Geo. H. Conibear, Chatham, at 70c per sq. yd. and 20c per lin. ft. of curb; Cornhill St., 2,166 sq. yds., Western Construction Co., at 71c per sq. yd. and 18c per lin. ft. of curb; Adelaide St., 2,344 sq. yds., Geo. Conibear, Chatham, 70c per sq. yd. and 20c per lin. ft. of curb.

Edmonton, Alta.—S. E. Reagh, Engineer, has been engaged by the Edmonton Auto and Good Roads Association to survey and report on the route of the proposed Jasper highway from Evansburg to Entwistle and thence through to Jasper park.

Fort William, Ont.—Contract for road grading let by City Council to Geo. Hacquoil, 149 W. Amelia St., Fort William, at \$2.95 per yard. Other tenders received: City Engineer, \$3.25; A. Salo, 819 Alberta St., Fort William, \$3.00; F. Stewardson, S. Marks St., Fort William, \$3.30; F. Tondato, Fort William, \$5.40; J. W. Bain, 521 Wiley St., Fort William, \$5.00.

Goudreau, Ont.—Provincial Department of Highways has awarded contract to Lang & Sons, of Sault Ste. Marie, for construction of road here.

Guelph, Ont.—Contract for construction of concrete sidewalks has been awarded to Balconi and Battangalla, at 17c per sq. ft. and 19c per sq. ft. for crossings.

Haldimand Co., Ont.—Tenders will be received by Harrison Arrell, County Clerk, Caledonia, until 12 o'clock noon, Thursday, June 1, for construction of two concrete bridges. Consulting Engineers, Frank Barber & Associates, Toronto.

Kitchener, Ont.—Tenders for construction of pavement close May 30. S. Cassel, Clerk, Waterloo County, Kitchener.

Loiselleville, Ont.—Contract for construction of the Grand Marais Road pavement, Township of Sandwich West, has been awarded to Pettypiece, Ltd., Amherstburg, Ont.

Merrittton, Ont.—Lincoln County Council has granted \$50,000 to the town of Merrittton to pave the main street. Clerk, Richard Clark.

Montreal, Que.—City Council authorized purchase of 2,000 tons of asphalt from Imperial Oil Ltd., at \$15 per ton.

Montreal, Que.—City Council authorized purchase of 100,000 granite blocks from W. McNally & Co. at \$113 per thousand.

Montreal, Que.—Administrative Commission recommended to City Council that Clarke St. be paved from Bagge St. to Marie Anne St. at an estimated cost of \$29,727.

Montreal, Que.—City Council authorized construction of pavement on Wellington St., between McGill St. and the limits of Verdun. Following work was also authorized: \$1,050 for sidewalk on north side of Dandurand St., between Papineau and Cartier Sts., \$1,320 for sidewalk on both sides of Delorimier St., between Dandurand and Des Carrières Sts.; paving Hudson St., from Desery St. to the limits, \$5,689.75; \$9,112 for sidewalk on west side of Clarke St., between Kelly and Boisseau Sts.; \$5,765 for sidewalk on east side of Clarke St., between Kelly and Dick Sts.; \$500 for preparation of plan re widening Ontario St. tunnel; \$2,956 for sidewalk on Lasalle St., between Beau-bien and St. Zotique Sts.; \$1,656 for sidewalk on east side of Mentana St., \$4,378 for sidewalk on west side of Charlemagne St., from Masson to Rosemount Boulevard; \$29,727 for pavement on Clarke St., between Bagg and Marie Anne Sts.

New Brunswick, Province of.—Following contracts for construction of gravel roads have been awarded: Musquash to Lepreau, 6 miles, to Carlo Carmiel, of St. John, \$30,000; Meropis to Welsford, 5.3 miles, to Concrete Builders, Ltd., Fredericton, \$34,000; Buctouche North, 4 miles, Concrete Builders, Ltd., \$32,000; The Range to Cumberland Bay, 6.1 miles, Department of Public Works, \$12,000; Andover to Aroostook Junction, 6 miles, G. Hammond, Prince William, \$24,000.

Niagara Falls, Ont.—Tenders for the construction of a bituminous penetration road for the City of Niagara Falls Suburban Area Commission, on the Portage Road from the City Limits to Southend, and on the Chippawa Road from the city to Chippawa Village, consisting of a total length of 3,622 miles, will be received until June 5, addressed to H. H. Beam, Secretary of Commission. Plans and specifications may be seen at office of the County Road Superintendent at Welland.

Ontario, Province of.—Contract awarded to McGinnis & O'Connor, Kingston, to construct four miles of macadam base on the Kingston-Ottawa highway, beginning east of Kingston. The ten miles of roadway between Kingston and Gananoque built last year is to be surfaced with Tarmia at once.

Ontario, Province of.—Contract awarded to E. G. Law Co., Toronto, for patching and surface treatment of 9½ miles of road from Barriefield to the Finger Board. Curran & Briggs, of Toronto, have contract for building culverts at Washburn, and W. Holcroft, student, Queen's University, Kingston, has contract to build culverts at Elgin.

Pickering Tp., Ont.—Township Council appropriated \$25,000 to improve and open up new roads. Clerk, D. R. Beaton, Whitevale.

Revelstoke, B.C.—Tenders will be received until 12 o'clock noon, Monday, June 19, for the complete substructure of a bridge over the Columbia River, at Revelstoke. Plans and specifications may be seen at the office of the Government Agent, Revelstoke; Government Agent, Vancouver; and the Department of Public Works, Victoria.

Saskatchewan, Province of.—Stewart & Cameron, 238 Grain Exchange, Winnipeg, have been awarded the contract for construction of road from Fairlight East to the Manitoba Boundary, and for construction of road from Blenfait to Estevan. The total amounts of contracts were \$8,936.60 and \$6,096.35 respectively.

Saskatchewan, Province of.—Tenders will be received until 12 o'clock noon, Thursday, June 5, for construction of an earth road from Canora south to Burgis. Plans and specifications may be seen at offices of following: H. S. Carpenter, Deputy Minister of Highways, Regina, Wm. Grant, 810 Canada Bldg., Saskatoon; J. R. Reid, Court House, Swift Current; F. G. Kissack, Dominion Grain Co., North Battleford; A. R. G. Bomford, Sec.-Treas., R. M. No. 274, Canora, Sask.

Saskatchewan, Province of.—Tenders will be received until 12 o'clock noon, Thursday, June 8, for construction of an earth road from Kamsack north six miles. Plans and specifications may be seen at offices of following: R. S. Carpenter, Deputy Minister of Highways, Regina; Wm. Grant, 810 Canada Bldg., Saskatoon; J. R. Reid, Court

House, Swift Current; F. G. Kissack, Dominion Grain Co., North Battleford; G. B. Harper, Sec.-Treas., R. M. No. 271, Kamsack, Sask.

Scarboro Tp., Ont.—Township Council passed by-laws to construct sidewalks on Birchcliffe Ave., Kildonan Drive, Eastwood Ave., Danforth Ave. and Kingston Road. The grading of Audrey Ave. was discussed, and a scheme to lay a macadamized road for a distance of 5 miles in the southern end of the township was referred to the engineer to report as to probable cost.

Sherbrooke, Que.—Contract for supply of an 11 cu. ft. paving mixer for this city was awarded to the London Concrete Machinery Co., Ltd., of London, Ont., who supplied one of their Standard No. 11 pavers with steam engine and boiler.

Simcoe, Ont.—The county of Norfolk will continue the construction of the Port Dover to Brantford highway, by laying Tarmia, macadam penetration, 13 feet wide, and will do the work by day labor. Tenders received for this work were considered too high.

Toronto, Ont.—Board of Control decided to take the first step toward widening Bloor St. by adopting the plan for a homologated line on Bloor St.

Walkerton, Ont.—Tenders will be received by Fred B. James, Town Engineer, until noon, Monday, June 12, for construction of about 18,000 sq. yds. asphalt or bitulithic pavement on concrete base.

Wingham, Ont.—Contract for laying of approximately 2,500 sq. yds. of concrete pavement, together with necessary excavations and drainage, has been awarded to W. C. Brennan Contracting Co., of Hamilton, at \$2.85 per sq. yd., which includes grading, laying drains and all material.

Winnipeg, Man.—Tenders close May 30 for construction of granolithic walks on Argyle, Henry, Winnipeg, Owens and Greenwood Sts. City Clerk, C. J. Brown.

Winnipeg, Man.—The Provincial Government will proceed with road work authorized in 1920. Bonds amounting to \$430,000 will be issued to complete this work.

York Tp., Ont.—Contract for construction of six reinforced concrete culverts awarded to Ramsay Contracting Co., Toronto.

WATERWORKS AND SEWAGE

Kamloops, B.C.—City Council passed by-law providing for raising of \$17,000 for completion of sewer system. City Clerk, A. W. Jackson.

London, Ont.—City Council intends to construct a sanitary sewer on Florence St., from the old city limits to Oakland Ave., at a cost of \$21,975.15. City Clerk, S. Baker.

Long Branch, Ont.—At a conference between the Public Utilities Commission of New Toronto and Etobicoke Township Council arrangements were completed for the waterworks system here. It will extend from New Toronto to west boundaries of Long Branch Park and north to G. T. R. tracks. The water will be obtained from New Toronto Waterworks System.

Montreal, Que.—City Council passed by-law providing for a loan of \$250,000 for water works purposes.

Montreal, Que.—Administrative Commission recommended to City Council that a credit of \$48,542 be voted for construction of a sewer in Lavendure St., from Gouin Boulevard to 42nd Ave.

Montreal, Que.—City Council authorized construction of sewer on Lavendure St., from Gouin Boulevard to 42nd Ave. at a cost of \$48,542, also sewer on Nicolet St. at cost of \$6,481, for which contract has been let to A. Thezand.

Nelson, B.C.—City Engineer is preparing plans for construction of sewers in Fairview.

Niagara Falls, Ont.—Contract for supply of a 4-in. centrifugal sewerage pump for sump work for this city was awarded to the London Concrete Machinery Co., Ltd., London, Ont., and is being filled by one of their London-Aurora

pumps, fitted with electric motor and automatic sump control.

St. John, N.B.—Tenders closed May 29 for the supply of approximately 500 ft. of 16-in. 2,350 ft. 12-in., 1,300 ft. 10-in., 7,500 ft. 8-in., 2,000 ft. 6-in. and 1,000 ft. 4-in. cast iron pipe. Also approximately 16 tons of special castings. R. W. Wigmore, Commissioner of Water and Sewerage.

Sarnia, Ont.—City Council intends to construct a vitrified tile sewer on Davis St., from Palmerston St. to East St. at an estimated cost of \$3,118.09. City Clerk, M. D. Stewart.

Toronto, Ont.—City Council intends to construct water mains in Cedarvale Ave., Glenrose Ave., Heath St. and Rosewell Ave., at a total estimated cost of \$3,780.

Toronto, Ont.—City Council intends to construct concrete curbs in Burgess Ave. at a cost of \$770 and asphaltic concrete pavement and Hillside brick block pavement in Burgess Ave. at a cost of \$16,127.

Toronto, Ont.—Tenders will be received, addressed to the Chairman, Board of Control, until noon, Tuesday, June 6, for the construction of sewers in the following streets: Victoria St., Small St. and Walpole Ave. Specifications may be seen at the Works Department, Room 6, City Hall.

Walkerton, Ont.—James, Proctor & Redfern, Ltd., have been engaged by the Town Council to report on the cost of improving the waterworks system. The work will consist of increased reservoir capacity, pumping equipment and some watermain construction.

Windsor, Ont.—Tenders close May 30 for the construction of pavements on a number of streets. City Engineer, M. E. Brian.

Winnipeg, Man.—City Council intends to construct sewers in Hector Ave. and Assiniboine Drive, at a cost of \$4,487. City Clerk, C. J. Brown.

York Twp., Ont.—Contracts for construction of cast iron watermains awarded as follows: Avon Ave. and Windermere Place to W. E. Taylor; LeRoy Ave., Greenwood Ave. and Mortimer Ave., Ruscica Bros.; Hopedale Ave., Minton Place and Stanhope Ave., P. Mohan; Bungalow Road, Chilton Road, Pepler Ave., Pape Ave., Goodwood Park Crescent, Bala Ave., Hilltop Road, Second Ave. and Kenora Crescent, G. Thompson.

LIGHT, HEAT AND POWER

Ottawa, Ont.—City Council passed a by-law authorizing the raising of \$250,000 for the extension and improvement of the Hydro-Electric plant and electric distribution system. City Clerk, N. H. H. Lett.

Unionville, Ont.—Tenders close May 31 for construction of dam and spillway. Engineers, James, Proctor & Redfern, Ltd., Toronto.

Winnipeg, Man.—Contract for erection of switch house building for the Hydro-Electric System in Cornish Park let to Anderson & Wilson, 578 Agnes St., Winnipeg.

RAILWAYS

Kingston, Ont.—The Canadian Pacific Railway Co. has decided to build a spur line into the feldspar mining district, which is located near Thirteen Island Lake.

London, Ont.—That 85 miles of new steel rail will be laid in the London division of the Grand Trunk Railway this year is now considered a certainty, as the Dominion Government, in the railway estimates, has approved \$1,099,180 to be used for that purpose.

London, Ont.—London division's share of the Grand Trunk appropriations included in the railway department estimates approved by the House of Commons, Ottawa, include the following items for repairs and maintenance: Rails, \$1,099,180; bridges and culverts, \$20,200; floor, freight shed, London, \$5,000; signal department storehouse, \$2,600.

Montreal, Que.—Montreal Tramways Co. will lay

double-tracks from McGill St. to the Lachine canal at Wellington St. bridge.

Ontario, Province of.—Premier Drury announced that the Timiskaming & Northern Ontario Railway Commission has been instructed to make a report on the present system of the North Shore & Lake Huron Railway (the Bruce Mines line) and also on the feasibility of extending it northward.

St. Thomas, Ont.—J. J. Corcoran, General Superintendent of the Pere Marquette Railway, announced that the proposed improvements on the Canadian Division this year include the re-ballasting of the entire road-bed, work on which has already commenced. Other improvements planned are the replacing of ties and laying steel.

Walkerville, Ont.—Transportation Committee of Council decided to have a switch built on Walker Road.

Wallaceburg, Ont.—Pere Marquette Railway will start work about June 1 on the laying of 18 miles of new 85-pound rails between Wallaceburg and Sarnia.

FACTORIES AND LARGE BUILDINGS

Armstrong R. M., Man.—By-law will be submitted to ratepayers to authorize School District of Cossette, No. 1378, to borrow \$8,000 for erection of school. Sec.-Treas., G. H. Lavender, Inwood, Man.

Aurora, Ont.—Taylor Rubber Co., of Toronto, plan erection of plant, plans for which have been prepared.

Birch Cliff, Ont.—Bell Telephone Co. plans to expend \$1,000,000 on erection of Blackstone exchange on Main St. **Burnaby, B.C.**—School Board approved plans for erection of High School. Architects, McCarter & Nairne.

Calgary, Alta.—General contract for construction of memorial hall for G. W. V. A. awarded to Gauley & Vandenhoogen, and plumbing and heating contract to Snyder & Co.

Carleton Place, Ont.—On June 12 by-law will be submitted to ratepayers to provide \$100,000 for a new High School and site, and also \$10,000 for converting the present High School building into a public school.

Charlottetown, P. E. I.—Contract for construction of Prince Street School annex has been awarded to MacDougall & McAuley.

East Toronto, Ont.—New telephone exchange may be erected here.

Erindale, Ont.—Tenders were received by Chas. H. Page, Sec.-Treas., P. S. Board, until May 29 for erection of a concrete block and stucco public school building.

Ford, Ont.—Tenders for the erection of a public school will be received until noon, Monday, June 5. Plans and specifications may be obtained at the office of the architect, A. H. McPhail, McGregor Building, Windsor.

Fort Frances, Ont.—Tenders addressed to R. E. Mason, Architect, Fort William, Ont., will be received until 5 o'clock Saturday, June 3, for the construction of a High School Building, Fort Frances, Ont.

Fredericton, N.B.—Imperial Oil, Ltd., plan erection of warehouse and garage on Westmorland St., contract for which has been awarded to John Powers, of Odell Ave.

Galt, Ont.—Plans are under way for the erection of a \$100,000 office building on Main St. for the Freemasons of this city. Address Col. A. J. Oliver.

Hamilton, Ont.—Plans are being considered for the erection of an additional building on the city hospital grounds. Supt., Dr. Langrill.

Kamloops, B. C.—Contract for erection of Masonic Hall awarded to Robert McKay at approximately \$29,000.

London, Ont.—Actual construction of the first unit of the expansion program at Western University that will eventually mean the expenditure of \$2,000,000 in buildings for the Western and affiliated educational institutions, will be commenced shortly. The plans for the new art buildings are completed and these will be placed before the board of governors for approval at the next meeting. Tenders will be called as soon as possible after the plans receive the final assent of the board. As soon as work is actually commenced by the Western University authorities, steps will

Shop views of one of three 36-in. Balanced Needle Valves made for the Ryobi Hydro-Electric Power Company of Japan.

The Coffin Balanced Needle Valve

The principle of the Venturi meter has been applied in the design of the Coffin Needle Valve, so that its capacity is equivalent to a much larger valve of the usual form. It is a balanced valve, yet it is of positive motion. Any laborer may operate it with the ease of an ordinary gate valve.

Especially adapted for use at the entrance to pressure lines or for free discharge under moderate or high heads.

Makers of the Largest Sluice and Gate Valves in America.

be taken towards the erection of the new Huron College buildings, it is expected.

Montreal, Que.—Permit issued to David Bros. for construction of a three-storey factory on Champlain St. at a cost of \$38,000.

Montreal, Que.—Plans for erection of new Anglican church for Cote St. Paul have been drawn by P. J. Turner, Architect. Approximate cost, \$35,000 or \$45,000.

Montreal, Que.—The construction of a new school for St. Clothilde parish on Sir George Etienne Cartier Square, in St. Henri ward, will be proceeded with in accordance with the plans of the Catholic School Commission.

New Westminster, B. C.—Exhibition Committee plan erection of new buildings at Queen's Park. Tenders will be called. President, Nels Nelson.

New Westminster, B.C.—Tenders, addressed to A. F. Proctor, Chief Engineer, Department of Railways, Victoria, B.C., for construction of a concrete retaining wall between the G. N. Railway and Front St., closed May 27.

Oakville, Ont.—Tenders will be received by C. F. Doty, Chairman, Building Committee, Oakville, until June 15 for additions and alterations to the Methodist Church Sunday School. Plans and specifications may be seen at the office of the Architects, Gordon & Helliwell, Confederation Life Bldg., Toronto.

Oshawa, Ont.—Following contracts have been awarded in connection with erection of McLaughlin Memorial Wing to hospital; Plumbing. W. E. Bramhall; heating, Miller & Libby; wiring; Canadian Electric Co., Toronto; fireproof stairs and fire escape, McGregor and McIntyre.

Ottawa, Ont.—Contract for construction of St. Luke's Anglican Church to Cooper and MacDonald, at \$42,182.

Ottawa, Ont.—Tenders close May 30 for erection of City Baths and Comfort Stations at corner of King Edward Ave. and York St. City Clerk, N. H. H. Lett.

Ottawa, Ont.—Time for receiving tenders for works connected with erection of Ottawa Civic Hospital buildings has been extended as follows: Plumbing, heating, ventilating and wiring in main building from May 25 until one o'clock, June 5; for power house, from May 30 until 2 o'clock p.m., June 13; for female help building, from June 1 until 2 o'clock p.m., June 15.

Owen Sound, Ont.—Permit issued to the McQuay Tanning Co. for erection of stone building 60 by 40 ft., three storeys, costing approximately \$10,000.

Ste. Anne de Beaupre, Que.—A church costing \$3,000,000 is to be erected here to replace the one destroyed by fire recently; also a monastery at a cost of \$500,000. A contest may be opened to architects carrying a prize of \$15,000.

St. Catharines, Ont.—Tenders will be received by Nicholson & MacBeth, Architects, 46 Queen St., St. Catharines, until 5 p.m., Thursday, June 1, for all trades required in the erection of a Temple for the Union Lodge of the Independent Order of Oddfellows.

St. Hyacinthe, Que.—Contract awarded by the Sisters of Charity of the Hotel Dieu to J. A. Durocher, of Montreal, for the construction of a hospital, at \$800,000.

St. John, N.B.—Provincial Government has been asked to authorize an issue of debentures amounting to \$230,000 for erection of school in West St. John, \$216,250, and foundation for Lorne School.

St. Thomas, Ont.—Committees of Alma College Board of Management have accepted plans of Architect Darrach for erection of gymnasium.

Sarnia, Ont.—Permit issued for addition to Central Methodist Church at cost of \$32,500.

Scarboro Tp., Ont.—Authority has been given by Township Council to School Trustees of S. S. 15 to raise \$40,000 to erect four additional rooms to School House No. 15.

Stamford Tp., Ont.—Trustees of Stamford High School accepted plans of C. M. Borter, architect, Niagara Falls, Ont., for an addition to the present school of four rooms and an assembly hall. Estimated cost, \$60,000.

Three Rivers, Que.—Fire destroyed the sawmill of Rouleau, Rocheleau & Dimontier.

Timmins, Ont.—Tenders, addressed to H. E. Montgomery, Secretary, Public School Board, will be received until Saturday, June 10, for a four-room addition to the Public School. Plans and specifications may be seen at the office of the Secretary, or of Ellis & Ellis, Manning Chambers, Toronto.

Toronto, Ont.—G.W.V.A. plan erection of memorial hall on Barrington Ave.

Toronto, Ont.—The directors of the Upper Canada Tract Society are considering the erection of a Sailors' Institute.

Toronto, Ont.—Plans have been prepared by Architect Langley for proposed new church building for Eglinton Presbyterian Church, North Toronto.

Toronto, Ont.—Erection of new Sunday School building and parish hall is planned in connection with St. Saviour's Anglican Church at Swanwick Ave. and Kimberley St., at a cost of \$18,000.

Toronto, Ont.—Plans for the new church building to be erected on the corner of Yonge and Heath Streets by Bloor Street Baptist Church are being prepared by Wickson & Gregg, Architects, Toronto.

Toronto, Ont.—Separate School Board awarded following contracts for construction of additional rooms at St. Rita's School: Carpentry, W. J. Madden, \$8,965; masonry, John T. Sullivan, \$15,375; plumbing and heating, W. J. McGuire Co., Ltd., \$9,759; plastering, E. J. Curry, \$1,750; painting, Jas. T. O'Hearn & Sons, \$1,048; electric wiring, Canada Electric Co., \$292; structural steel, Hepburn and Dishar, \$930; marble, J. G. Gibson Marble Co., \$2,275; galvanized iron, Beaver Roofing Co., \$597; metal ceilings, J. J. Glynn, \$1,150; mastic work, Vulcan Asphalt & Supply, \$469.

Toronto, Ont.—Plans for the \$90,000 six-room addition at Humber College have been approved and tenders will be called for shortly by Board of Education. Sketches for four rooms on the third storey at Runnymede School and for an addition of four rooms and a kindergarten at Kitchener School, each to cost \$75,000, have been approved. An addition of four rooms will be built at Bedford Park at a cost of \$50,000 and work on drawings is under way. Sketches for five rooms at Gledhill School have been approved by the Property Committee; an appropriation of \$100,000 has been made to cover the building of a new eight-room building on Bowmore Road to relieve Norway and Roden Schools; and a site is being bought for a similar addition to Morse and Leslie Schools to cost \$100,000. Four rooms will be built and two rooms finished at Kimberley School.

Vancouver, B.C.—Tenders, addressed to W. D. Harris, Secretary, Vancouver Harbor Commissioners, for electrification of Granville Island trackage, closed May 20.

Walkerville, Ont.—The Municipal Hospital which it is proposed to erect here will cost approximately \$100,000.

Waterloo, Ont.—An addition costing approximately \$30,000 is to be built to the Waterloo Theological College and Seminary.

Welland, Ont.—The erection of a Technical School is projected.

Welland, Ont.—E. Atkins awarded the contract to G. S. Pettit for the erection of a two-storey brick block on the corner of East Main and Burgar Streets.

Weston, Ont.—School by-law which involves an expenditure of \$115,000 will be submitted to ratepayers on June 3.

Whitby, Ont.—Erection of Fire Hall is planned. Clerk Albert W. Jackson.

Whitby, Ont.—Tenders addressed to Joseph King, Chairman, Board of Education, will be received until Thursday, June 1, for masonry, carpentry, painting, plumbing, heating and ventilation and electric wiring for alterations and additions to Dundas St. School.

York Tp., Ont.—York Township Council passed by-law providing for raising of \$155,000 to enable Board of Public School Trustees of S. S. No. 26 to erect a 12-roomed addi-

Substructure, Johnson St. Bridge, Victoria, B. C.

Central Single-Leaf Spans With Plate Girder Spans at Either End — Construction of Concrete Piers and Abutments — Details of Caisson Construction — Launching and Sinking Caissons — Pouring Concrete Under Water

By F. W. ALLWOOD,
Resident Engineer, Victoria, B.C.

ONE of the topographical advantages of the City of Victoria, B.C. is an inlet of navigable proportions which practically divides the town into two portions. On the western side of this inlet is located the large residential section known as Victoria West and also Esquimalt, the centre of the shipbuilding industry, while on the eastern side are the main business sections of the town together with the various docks and wharves, etc., which make up the harbor. The connecting links between these two sections of the town have been, hitherto, a traffic bridge known as the Point Ellice bridge which is very much out of the way, and a footpath across the Esquimalt and Nanaimo

one, and then to move the tracks back into their final position. It can be easily seen that a great deal of care had to be exercised in designing not only the foundations but also the steelwork which on the approach spans was eccentrically loaded. In addition to this the highway and railroad portions or the easterly approach spans diverged and the yard switches and curves for the Victoria terminal

ELEVATION JOHNSON STREET BRIDGE

Railroad bridge which is the most direct route between Victoria West and the city proper.

For some years it has been recognized that there would have to be, sooner or later, a bridge built on or near this latter site, but it was not until the winter of 1919-20 that the electors gave their consent to the expenditure of the \$720,000, which was the estimated cost of the completed structure.

General Layout of Bridge.

The general lay-out consists of two separate bridges for the highway and railroad respectively, built on the same piers with central single-leaf bascule spans capable of being operated as one, and with plate-girder spans at either end. The reason for building separate bridges was that the northerly or railroad portions of the substructure of the new bridge were found to be too close to the foundations of the old bridge for safety, and the use of this for railroad traffic could not be discontinued until after the erection of the new structure. It was therefore decided to build the southerly or highway portion first and then switch the E. & N. R. on to this portion, next to wreck the old bridge and complete the northerly half of the new

of the E. & N. R. commenced in the middle of the span, further complicating the stresses and rendering the whole design a matter of many heartaches.

Details of Substructure Units.

The substructure of the bridge consists of five concrete units namely: The east abutment, counterweight trunnion pier, main trunnion pier, rest pier, and west abutment. It was found possible to build only the counterweight trunnion pier, rest pier and west abutment completely, and the east abutment and main trunnion pier only in part. This portion of the work was combined in contract No. 1 and on tenders being called for, the city engineer's estimate by day labor being the lowest, he was instructed to proceed with the work.

The west abutment and portion of the east abutment in contract No. 1 were founded on rock and being for the most part above high water, presented no difficulties worthy of note. The counterweight and main trunnion piers however, were founded on piles driven to rock; timber caissons being used in their construction, some details of which may be of interest. The caisson for the counterweight trunnion pier was 94 ft. 9 in. long by 24 ft. 3 in.

overall, while that of the main trunnion pier was 68 ft. long by 17 ft. wide and in each case 45 ft. high. They were sunk into the mud a distance of 13 ft. by excavating

DRIVING PILES FOR MAIN TRUNNION PIER WITH STEAM HAMMER

inside the caissons and forcing them down by means of loaded sandboxes built onto their sides. The lower 13 ft. then of each caisson constituted the forms for the base of the pier and were therefore left down in the mud, being separable from the upper portions. They were built up to the twenty-fourth course on ships-ways after which they were launched and towed to the site where they were completed. These first thirteen courses consisted of 12 by 12 in. timbers laid horizontally with butt joints at the corners, and were drift-bolted at 5 ft. centres, staggered. Between the thirteenth and fourteenth courses, a joint was made consisting of pairs of angle irons, each pair being attached to the courses immediately above and below the joint, with the upstanding legs of the angles bolted together. Permanent cross frames were put in at 23 ft. 6 in. centres, and before pumping out the caisson, sliding frames were let down and wedged into position by divers, thus reducing the spans to about 8 ft.

Counterweight Trunnion Pier Caisson.

Owing to the spans across the ends of the counterweight trunnion pier caisson being 24 ft. 3 in., 12 by 12's

MAIN AND COUNTERWEIGHT TRUNNION PIERS COMPLETED

were not of sufficient strength to withstand the head of water on the outside of the caisson when it was pumped out, this head at high water being 30 ft. and it was found

cheaper to extend some of the side timbers and construct trusses to carry the load. Above the joints a very successful, if unusual, method was used to render the structure watertight. Two layers of jute rope were laid on the top of each course about 5 in. apart and an asphalt mixture poured between them before the laying of the next course. In addition, over each joint was laid on the outside a strip of canvas 5 in. wide held in place by a 1 by 3 in. batten spiked to the timber. This was found to be most efficacious, superior to caulking and far less costly. As an example of its advantages, while sinking the larger caisson, a thin crust of hard pan was encountered through which it broke causing the whole structure to topple sideways and take up a position of about 15 deg. to the vertical. This racked the caisson considerably and would certainly have been disastrous had caulking been used, but as it happened, no particular difficulty was experienced in pumping out. The strips of jute and asphalt filling also helped considerably by enabling the corners to be shimmed up and kept level, which would otherwise have been difficult owing to the lumber not always being sized exactly.

Caisson With Collapsible Bottom.

When the twenty-fourth course was reached, a collapsible bottom was built inside the caisson and about 5 ft.

CAISSON FOR MAIN TRUNNION PIER JUST BEFORE LAUNCHING

from the bottom. Pontoons consisting of 3 ft. diameter steel pipe about 18 ft. long each, were strung along the outside of the caisson at approximate water line. The whole structure was then launched in the ordinary manner. The collapsible bottom was constructed owing to the fact that there was not much water at the end of the ways and it was feared that the caisson would go aground, which would be avoided if the water percolated slowly through this false bottom, allowing the launching boat to pull the structure out to deep water before it filled entirely. The launching was a complete success in all cases and the method described is recommended.

After the caisson had been sunk and the excavation completed, piles were driven to rock, washborings being first taken and the piles cut off to the required length, which were sufficient to leave 5 ft. projecting into the concrete at the base of the pier. They were driven with a Union Ironworks steam hammer No. 1, with a follower, the average penetration being 40 ft. It was found necessary on several occasions to submerge the hammer, and some doubt was felt as to the wisdom of allowing cold water to touch the heated iron; for this reason air was tried, but was found far too expensive and steam was resorted to with no evil consequences.

Pouring the bases of the piers under water gave rise to the development of an underwater bucket, invented by F. M. Preston the city engineer. This provided for the

VIEW OF CONCRETE GUN FOR POURING CONCRETE UNDER WATER

concrete being lowered into place in a closed bucket under air pressure sufficient to balance the water pressure outside. A gate at the bottom of the bucket was then tripped and emptied by gravity. The resultant concrete was found to be excellent, far above the average quality of subaqueous work and with very little laitance on the surface.

Caisson For Rest Pier.

The rest pier was founded on rock and as it was impossible to employ a cofferdam, a caisson had to be used with a row of sheet piling driven around it. Unfortunately it was found that the rock on the northerly third of the site was some 12 ft. higher than it was on the southerly two thirds, making it an awkward proposition to get a caisson to fit even approximately. This however, was accomplished by building the southerly portion of the caisson up 14 ft. and then allowing the northerly portion to overhang for the remainder of the way up. On excavating, a bed of exceptionally hard clay and sand, almost a shale, was encountered immediately on top of the rock. This bed averaged between 3 to 4 ft. in thickness and

COMPLETING POURING CONCRETE FOR COUNTER-WEIGHT TRUNNION PIER

after trying several methods, the following was used with success. A high pressure water jet consisting of 2 in. hydraulic pipe with a nozzle flattened to about $\frac{3}{4}$ sq. in.

was suspended from the top and worked below by a diver. This gave about 100 lb. pressure at the nozzle and was found to break up this material sufficiently well to enable a clamshell bucket to handle it.

To avoid having to clear out the last few inches of mud from the rock, the sheet piling was driven about 3 ft. away from the side of the caisson which gave ample room for the dregs to be blown away by the jet from immediately under the base of the pier. It might be noted that this layer of shale was of sufficient hardness to obstruct the passage of the wash-boring apparatus so that considerable extra excavation had to be done.

At the time of writing, this entire contract amounting in all to over \$200,000 is all but completed, and it is of interest to note that a civic department has been able to undertake and carry out this work successfully, not only from an engineering, but also from a financial standpoint.

EXPENDITURE ON LINCOLN HIGHWAY.

STATISTICS furnished by the Lincoln Highways Association, which has been promoting the development of this highway since 1913, show that 397 miles of new construction were completed during 1921 at a cost of \$7,737,473. Maintenance during 1921 cost the States and

PLACING CONCRETE UNDER WATER, REST PIER BASE

counties through which it passes, \$1,735,433, so that the total expended on Lincoln Way betterment was \$9,472,906. The additional mileage improved last year represents 12 per cent. of the total mileage.

The expenditures on Lincoln Way improvement in 1921 brought the total expended on this great national traffic artery since the dedication of the route in 1913, to more than \$40,000,000, or more than twice what was originally estimated would build the Lincoln Highway from coast to coast.

The marking of the Lincoln Highway was finally completed in 1921 when, with the co-operation of the New Jersey State Highway Department, the last permanent signs were placed along the 60-mile link between Jersey City and Trenton. The balance of the marking done in 1919 and 1920 has been well maintained, with the result that a uniform marking system now extends from the Hudson River to the Golden Gate. The Lincoln Highway is the best marked road in America and this system, installed at such great expense, is a wonderful aid to through traffic.

Messrs. Royce Limited, Manchester, Eng., have received an order for four Royce standard three motor overhead electric travelling cranes, each of 40-tons capacity and fitted with a 10-ton auxiliary lifting barrel. These cranes are for service in India.

HIGHWAY TRAFFIC CENSUS*

Character of Traffic Controls Highway Design — Tendency
Towards Lighter Vehicles — Limitations to Traffic
Census — Main Purpose of Census

By J. Gordon McKay,

Professor of Economics, University of Wisconsin.

HIGHWAY design must necessarily be based upon traffic, and the behavior of the various details of design observed under different ranges and types of traffic. Highway transportation is in a condition of flux. An immense growth may be anticipated in the next decade. Our rapidly growing mileage of completed highways, with the prospect of continuous increase each year of construction programs, emphasizes the urgent need for road information upon which to base sound, economical road building policies, that we may avoid the mistakes and disasters of unwise financial methods and unsound construction policies. The solution of engineering problems of design, maintenance, and the like, depends largely upon the character of the traffic, its speed, and the unit loads the highway must carry. The true purpose of an improved highway is a high degree of transportation service at the least cost to the public and road user. Clearly a traffic census is not a panacea, but without a knowledge of the actual traffic, speed, type, and weight, of a given area, we are working in the dark. The actual traffic, in terms of volume, density, speed, and unit weights, must be correlated with laboratory and experimental impact tests as a guide to rational design. Independently each type of research is valuable, but the true worth of both cannot be realized until combined. In other words, interpreting the results of laboratory experiment in terms of vehicles on the highway.

Heavy or Light Vehicles.

Our state and national investments in highway systems is constantly increasing. The investment in motor vehicles and the automotive industry is growing steadily. A careful analysis must be made of the chief traffic elements responsible for increased construction and maintenance costs before the enactment of legislation which may, while protecting the highway, prove injurious to the growth of highway transport service, and detrimental to the automotive industry. We must be certain of our facts before we limit the traffic which may pass over any given highway. The limitation of wheel and gross loads must be based on definite information. The rapid destruction under heavy traffic does not necessarily mean that the construction of more durable pavement types is essential. It is conceivable that the heavy freighting vehicle is not an economic unit load, and that ultimately a smaller unit will become the maximum, but first we must have proof obtained by impartial research.

In making comparisons of the economies of the different methods of freight movement we are prone to make comparisons on the basis of operating costs alone. The true haulage cost must be based not only upon the cost of operation of the vehicle, but also a portion of the cost of building and maintaining the highway for the movement of vehicles, and must be included as a cost charge. Naturally this cost increases rapidly as the unit loads increase. Saving in transport costs may occur when heavy vehicles operate, reducing the freight costs by a few cents per ton mile. On the other hand, a decided economic and social loss arises when new roads must be built, or maintenance costs are excessive due to the utilization of the highway by heavy vehicles. The savings in operating costs of a few cents per ton mile are more than offset by the heavy construction and maintenance charge. It is not alone a question of cost, but the road is out of service which is even more serious.

It may be that increase of tire width per capacity trucks to carry the freight load without destruction of the pavement. A study of the comparative economies of three, five and seven ton trucks with regard to highway construction and maintenance, vehicle operation costs, and service time, would settle this controversial point and determine the maximum economical lead unit.

It does not appear that the use of pneumatic tires is a possible solution, limited to use on small capacity trucks, and prohibitive in cost.

Today we see a strong tendency in the direction of restrictive legislation limiting the total loads which may pass over our highways and bridges. We must be careful and sure of the facts upon which such legislation is based, and injure the transport value of a given highway which such legislation is attempting to conserve. The classification of a highway system which limits the gross weight to twelve and a half tons on a very small percentage of the roads of a state, and to seven and one half tons on the balance of the state system definitely limits the sale area of the manufacturer of larger capacity trucks. It is to the truck manufacturers' best interests to cooperate in the solving of his difficult problem in order that his market may not be restricted beyond reasonable limits. The establishment of weight limits per inch of tire width must be based upon conclusive evidence and research, and not mere belief.

The manufacturer of trucks cannot afford to design and market vehicles which unduly increase the cost of construction and maintenance of our highways. The highway engineer cannot afford to build roads that will cripple or limit unduly the hauling capacity of trucks. There is a joint enterprise, the movement of the maximum traffic at a minimum cost, and upon its successful solution rests the welfare of both the public and the vehicle manufacturer.

Motor Trucks Versus Railroads.

It is an open question whether or not the ultimate sphere of motor truck operation is to be competitive with or supplementary to our existing transport system. The consideration of this problem carries with it far reaching consequences, beyond a mere comparison of the cost of movement of freight by one or the other type of carrier. The movement of freight is by nature monopolistic and does not permit of true competition. Either one or the other type of transport will occupy the field. The possibility of junking our railroad investment due to motor truck competition would involve the destruction of property rights representing approximately one-twenty-fifth of our national wealth. We must consider the relative difference in the investment, comparing a large railroad system with strict governmental regulation of rates and service, with fleets of motor vehicles, in which the investment of the owner is small, with an absence of rate regulation or guarantee of service. The railroad investment is permanent and cannot move to an alternative field; it must operate or become a loss. The commercial vehicle operator, however, may move to alternative fields when profits fall. This naturally would endanger the guarantee of freight service which is a more fundamental question than cost. It is difficult to conceive of a movement of heavy freight of low value by truck transport. The cost of moving such products as coal and iron, practically limits the commercial truck field to high value and low bulk goods. Can the railroads operate profitably moving the low value and large bulk commodity goods on the short haul, while the profitable business is absorbed by the motor vehicle? Any comparison of the two types of transport with a view of selection of the more economical type involves a comparison of costs. In such an analysis we must not forget that the cost of construction and maintenance of the road bed in both cases, is a part of the charge which must be made against the freight moved. A proper share of construction costs and maintenance costs of the highway right of way must be paid by the truck operator, before a real comparison of rail and truck rates can be made.

A clear analysis of all the factors involved must be made before we can determine whether the field of truck

* Paper read at the American Road Builders' Association Convention, Chicago.

operation as a carrier is to be competitive on the short haul, long haul, both, or supplementary to existing transport systems.

Unprejudiced research is fundamental in the attempt to solve these many difficult highway problems. Supply definite information to highway engineer that the type and weight of traffic will not change over night, and he will build safely and permanently roads able to carry the traffic at a cost not exceeding the service value of the highway to the community. The vehicle manufacturer in all fairness is entitled to know the facts upon which he must design and build trucks which will meet the requirements of the constantly increasing highway legislation.

In approaching an analysis of some of the factors involved in highway construction and maintenance, and motor vehicle movement, a clear picture of the traffic passing over a given highway is essential to a thorough understanding of the type of construction necessary for traffic of a given type, giving at the same time a definite idea of the regularity of motor vehicle movement, density, weights and produce.

A traffic census may be defined as "a complete summation of traffic passing over the highways of a given area during a definite period of time."

Traffic Census Limitations.

Every traffic census has certain limitations and a traffic census based on the following plan has the following limitations:

1. A certain portion of the traffic over newly completed roads consist of "attracted" traffic from other routes, and does not represent the true traffic which will ultimately pass over the particular highway observed. Allowance must be made for re-distribution of traffic when parallel highways of the complete system are constructed.

2. We cannot expect that a summation of vehicular movement will accurately portray future traffic. To obtain a picture of future traffic the census must be taken at given intervals of time over a period of years to determine the percentage increase of each vehicle type. The potential traffic of a given area to supplement the actual traffic census may be obtained by a survey of the agricultural and industrial growth of the community.

3. Only in a general way will the census data answer the question of the influence of various types of traffic on the highway without maintenance studies of the same road, correlated with impact studies. To be able to interpret correctly the weight and volume data, accurate maintenance cost studies are essential. It is advisable in the selection of traffic census stations to place them on highways on which maintenance costs of the various types of pavement are kept.

4. The tonnage volume and weight per capacity of various vehicles will be more valuable when combined with impact studies showing the effect on different types of pavement by impact tests. Being given the result of impact studies on several road types, produced by the different vehicles as shown by the census, the construction engineer can be assured of the type of highway he must build to carry the traffic. This will prevent over or under-construction with the economic wastage occurring in either case.

In the past, traffic censuses have been taken by state highway departments largely for the purpose of determining the number of vehicles, passengers and types to indicate numerical movement. Generally such survey occurred during density of movement and for short periods of time. In a few cases the period of the survey was longer, while in one case actual weights were recorded.

Main Purpose of Traffic Census.

In the belief that the expense of taking traffic census should produce more than surface results, and that the importance of the problems involved, calls for definite information, the following outline of a traffic census is evolved.

The main purposes of a traffic census may be summarized as follows:

1. An aid in determining the economic value of a highway. Three principal factors enter into the valuation of a highway improvement. The increase in land values, highway service value in terms of passenger and freight ton miles, and the general value to a community. The only method of obtaining passenger and freight ton miles, is by means of a traffic census for a definite period, translated into yearly traffic.

2. Classification of vehicular traffic. A classification of traffic of the several types is useful in formulating traffic regulations, and to some extent in determining the percentage source of revenue from highway users in accordance with their actual use of the highway.

3. To determine gross truck weights, overloading per truck capacity, and wheel loads. Weight and speed are guides to design, pavement selection, limitations of grade and alignment. The facts as to overloading per capacity can only be determined by a knowledge of front and rear axle, distribution of weight in terms of loads per inch of tire width. It is not merely a problem of loads beyond a given maximum, but the real difficulty lies in overloading beyond truck capacity.

4. Distribution of construction and maintenance funds. To distribute maintenance and construction funds in a fair proportion to traffic, we must know the volume and type of traffic on the different highways. The greater the volume the traffic, logically the greater the percent of construction and maintenance funds allocated.

5. To determine traffic density and truck body widths. The peak of traffic, hourly, daily, and during the season is essential. Peak density and speed influence width of pavement and determine the maximum width necessary to carry the peak load. A direct ratio exists between vehicle body widths and pavement width. Pavement width increases with the increased speed movement of the vehicle, particularly when the load is heavy.

Seasonal and yearly traffic volume and density enable a prediction in a general way of future traffic.

6. To determine the vehicular movement of freight.

Information as to regular and irregular trucking lines throws light on the proportion of regular freight movement. This is particularly valuable in the industrial states of the east and northeast.

The average length of haul of commercial freighting indicated the field of competition of the truck and the railroad, whether the short or long haul. The average New England haul is forty-seven miles.

The type, volume, and value of commodities moved indicate the commodity competition and the percent of high value and small bulk freight moved as compared with low value and large bulk freight.

The average delivery time indicated the rapidity of movement of commercial freight service.

Information relative to truck operating costs and freight rates does not properly lie in the field of the traffic census, but must be made through independent studies.

7. Average speed of vehicles.

This data must necessarily be obtained at the same time the census is recorded to check each vehicle observed in the speed test with the data obtained at the census station. The recording of the license number in each case permits the determination of capacity and weight. This information is useful in the formulation of speed regulations and their enforcement.

8. Basis of the formulation of traffic regulations and their enforcement.

The information as to weight, overloading, tire condition, body widths and speed not only afford a reasonable basis of traffic regulation, but is the data upon which enforcement depends.

Connecticut Traffic Census.

With these purposes in mind a comprehensive study of highway traffic was conducted in the state of Connecticut during August and October of 1921 by the Connecticut

Highway Department in co-operation with the Bureau of Public Roads. This survey consisted of two traffic census conducted on two of the principal highways of Connecticut according to a plan I had outlined as the basis of a model traffic census, and was put into operation by Highway Commissioner Bennett of the State of Connecticut. Each survey covered a period of two weeks, and included two night surveys to determine the percent of night movement. Scales were installed by the Connecticut Highway Department on the roadside by means of which the actual weights of trucks were obtained.

A passenger car schedule which was drawn up, enabled a classification to be made of makes of cars, cylinders, number of passengers, and the license number data to determine the percentage of inter-state vehicular movement. The start of haul and end of haul made it possible to determine actual mileage. This was important since knowing the number of passengers carried by each car and the mileage for each car we could determine the passenger miles and arrive at an estimate of the passenger transport service of the highways on which the census occurred.

The truck schedules were divided into two parts. The first dealing primarily with weights, body widths, makes, and tire conditions while the second schedule included capacities, consignor and consignees, and commodity loads. The first schedule gave the weights, distributed between front and rear axle which were the basis of the overload study. The width of tire was taken at the same time enabling a study of loads per inch of tire width.

A second truck schedule enabled a study of commodity movement, and mileage, and whether regular or irregular movement of freight. The origin and destination of commodities make possible a study of the distribution of goods from points of origin to points of distribution, by cities, making it possible to compare the movement of goods by truck with railroad movement, having the commodity movement, and net tonnage of each class of commodities, the truck tariff and railroad tariff to the same points of distribution may be compared. Finally the type of commodity moved, and its volume, permits a comparison of the gross tonnage with the railroad classification, showing the difference in the principal types of commodities carried by rail or by motor transport.

DESIGN OF POWER CANALS, HEADWORKS AND SURGE TANKS

IN the symposium on hydraulics held last March at the University of Toronto under the auspices of Prof. Angus of the Faculty of Applied Science, the fourth lecture was given by T. H. Hogg, assistant chief hydraulic engineer of the Ontario Hydro-Electric Power Commission. Mr. Hogg's address covered the general features of intakes, canals and surge tanks. Owing to the limited time at his disposal, the speaker was able to deal only in a general way with the various subjects under consideration, but succeeded in conveying to a most interested audience the function and requirements of the canal and surge tank in a power development.

In dealing with intakes and ice protection it was pointed out that an intake performs the dual function of providing a means of control for the water and also of preventing the entrance of ice into the canal. Various forms of intakes were described, including the ones in the existing plants at Niagara Falls and the proposed intake for the Chippawa-Queenston development. In dealing with the latter the speaker pointed out that this structure provides two forms of intake, one the ordinary open type with breast wall for use when there is no ice in the river, and the submerged type for use with ice flowing and consisting of six tubes on the river bottom, with slots in each so arranged as to have a draft throughout their length proportionate to the amount of water intercepted by them.

Mr. Hogg also pointed out different means for combatting ice, which, he stated, forms a greater problem in

plants in moderate latitudes than it does in plants in the extreme north where an ice cover forms early in the season and lasts until the spring break-up.

Headworks were differentiated from intakes as meaning the entrance to pipe lines or conduits, whereas an intake was described as being the entrance to a canal or forebay. In dealing with headworks the speaker pointed out the advisability of securing uniform flow over the entire rack area in order to avoid high velocities at centralized points as often occurs with the ordinary design of headworks. He cited the provision being made at the Shawinigan Water & Power Co's plant for securing uniform draft at the entrance to their new 22-ft. diameter pipe line. The advantage of racks designed in independent and replaceable units instead of being built up as continuous structures was also pointed out, and the many failures, with consequent shutdowns, were mentioned to impress the importance of this feature.

Concerning canals it was pointed out that while the theory of flow in channels is all based on uniform flow, this is a condition that rarely exists in actual practice; the method of investigating backwater and drop-down curves was mentioned but not dealt with, as this subject is included in the University lectures on hydraulics.

It was pointed out by the speaker that within limits the slope of the bottom of the canal has very little effect on the discharging capacity, and that alignment of the sides and bottom of a canal are of more importance in securing discharging capacity than the smoothness of the surface in contact with the water.

The speaker pointed out the danger of using theoretical values and formulae without giving consideration to the assumptions on which these are based. As an example he cited the case of a channel in rock, the most efficient section of which is given in all works on hydraulics as having a width twice the depth; this is economically true only when the ground line coincides with the water surface, and must be modified as soon as there is any overburden to be considered. This factor, however, is not usually pointed out in text books, and is apt to be overlooked by one whose experience along this line is limited.

The function of the surge tank for regulating long pipe lines was clearly outlined by Mr. Hogg, who showed how in the case of the differential tank that the immediate demands of the turbines are supplied by the stored water in the tank, while the drop in the internal riser causes a quick acceleration of the water in the pipe line. The difference between a differential tank and a simple tank was pointed out, and the application of a process of arithmetical integration to the investigations of the surges occurring in these two kinds of tanks was explained, and the various factors to be considered were enumerated.

The application of this method of investigation to other problems such as water works intakes and pressure rise in pipe lines, was shown by Mr. Hogg; also how all consideration of velocity changes in conduits is based on Newton's "Second Law of Motion." He developed the acceleration formula for pipe lines in the following way:

$$F = Ma \text{ (Newton's second law).}$$

$$M = AWL/g = \text{mass of water in conduit,}$$

$$a = dv/dt = \text{acceleration.}$$

$$F = AWha = \text{accelerating force acting on the water column.}$$

$$AWha = (AWL/g) (dv/dt).$$

$$dv/dt = gha/L,$$

$$\text{where } F = \text{force}$$

$$M = \text{mass}$$

$$a = \text{acceleration}$$

$$ha = \text{accelerating head}$$

$$g = \text{gravitational unit}$$

$$w = \text{weight of a unit mass of water.}$$

By the use of this formula the speaker showed the drop in the gradient of a pipe line due to a sudden acceleration of velocity, and pointed out the necessity of investigating all pipe lines for this condition in order that a sudden change in load would not draw the gradient below the top of the pipe with the ensuing possibility of collapse.

SAFETY AND BEAUTY IN THE LAYOUT AND DESIGN OF HIGHWAYS*

Eliminating Hazards in Highway Travel — Value of Attractive Routes — Construction of Curves, Detours, Bridges — Trees Offer Effective Relief.

By A. R. Hirst,
State Highway Engineer of Wisconsin.

HIGHWAY officials who were concerned in the design and construction of highways prior to 1900 were fortunate in that they had to pay little attention to many factors which now very materially complicate the design of modern pavements. It was sufficient then to grade and drain a highway well, and place a macadam surface of narrow width; about the only element of risk being the danger at grade crossings with railroads. Traffic was light and slow moving. At that time a horse vehicle travelling at the rate of twenty miles an hour was a meteor, and a heavily laden wagon an element of destruction.

In designing highways for present day traffic, the engineer is confronted with a much more intricate problem. Not only must we design highways which will withstand traffic, but we must also design them so as to be safe and aesthetic.

We are designing and building highways, many of which have a traffic of over ten thousand vehicles on certain days, and any road considered even of minor importance is carrying traffic of four or five hundred vehicles daily. This traffic is moving very rapidly, and much of it is very heavy and also moving rapidly.

For some years yet the increase of motor vehicles is probably going to be greater in percentage than the rate of construction of adequate highways. The manufacture of trucks and automobiles has by no means reached the limit. We will undoubtedly see automobiles radically cheaper, and motor trucks even more materially reduced in price. I am willing to risk the prediction that fifteen years from now practically every American state will register double the number of motor vehicles that it registered in 1921.

Regardless of the growth of motor vehicle traffic in the future, the amount of which we now have is sufficient to make the subject of the safe design, construction, and maintenance of highways of the greatest importance.

The construction of a modern highway is the building of a transportation artery and in its design we should fully consider all transportation factors involved. The bare factor of getting traffic over the road so that it does not mire in the mud or break down is a small part of the whole. Traffic should be enabled to move comfortably, safely, and rapidly without danger either to itself or to other vehicles using the same road.

Too many of us have plodded along in the old ruts, building just highways, when we should have been building arteries of traffic. We seldom stop to think that more passengers and freight are carried on our principal highways than on many important railroads. Railroad tracks are not merely built to bear the weight of trains, but they are so designed and constructed that trains can move expeditiously and safely, and every precaution is taken to prevent accidents. If it was good public policy to force the railroads to tremendous expenditures for the safety of railroad traffic I can see no reason why it is not equally good policy for the public to protect its own by building really safe highways.

Layout of Systems.

The first and best chance which a state highway department has of eliminating hazards in highway travel, is in the original layout of the highway system which it expects to build.

The great majority of American States are now fairly well provided with strips of land set aside for highway

purposes. Those states which have made comparatively little progress in the construction of modern highways have, in these lines of travel, more or less undeveloped, the routes of their final highway systems. In laying out the various highway systems such as federal systems, state systems, and county systems, it is possible by careful preliminary work and investigation in establishing the approximate future course of these highways, to eliminate very considerably the present hazards, without expending anything but brain work in making the eliminations.

In Wisconsin, in laying out the state trunk highway system, it was possible for us to eliminate a large number of grade crossings with railroads, heavy grades, right angle and other dangerous curves, and other hazards without spending a dollar in construction but by simply selecting routes other than those which had been previously followed. If we had this work to do over again we would be much more radical in making new routings.

Another factor which should be considered in the layouts is that of making accessible or visible any feature of the landscape or topography which is extraordinary, beautiful or attractive. Weight given to the selection of routes which are attractive, scenically or artistically, rather than purely utilitarian will vary very much in accordance to the area traversed and the country served. Those States which are intending to capitalize and encourage tourist traffic should pay a very considerable attention to the factor of having their roads run, wherever possible, where the scenery is attractive or where lakes, rivers, mountains, forests, etc., can be set out well and made fully accessible. In States which have not these features or in parts of States where these features are not present, there should be the strictest adherence to utilitarian practice in selecting the shortest road which will carry traffic safely and cheaply.

We have found, by sad experience, that any effort to serve two purposes with one road or to compromise on locations is a fatal mistake. Serve those purposes which should first be served with the right road, and if there is not enough mileage to go around, serve the other purposes with the right road later.

Design.

It is in the design of highway structures that the greatest advancement can be made towards securing both safety and beauty. Up to the present the principal idea of American highway engineers has been to build a structure which would stand up under traffic. Not only has very little attention been paid to the artistic, but in many cases very little attention has been paid to safety. Practice along safety lines is, however, making rapid advances as traffic gets heavier and faster.

Curvature.

A large proportion of the accidents on highways take place at curves, both vertical and horizontal, and it is at these critical points that probably the greatest advance in the art of highway design can be made.

It has recently been stated that more accidents occur on highways without curvature than occur on curving and supposed to be dangerous highways. I doubt if this is true. If so, it is undoubtedly due to one or both of two causes; (a) too narrow widths of surfacing; (b) the presence of more traffic on the straight away stretches than on the sections with excessive curvature. I doubt not that if the exact number of vehicles and of accidents were known, that in practically every case the road with the sharpest curves would show the most accidents per mile of traffic. Any comparison of accidents without a comparison of traffic is absolutely worthless.

Vertical curves are almost as dangerous as horizontal curves, especially if the surfaces are narrow and the drivers do not keep to the right side of the road on approaching the crown of hills. Vertical curves should have a radius of at least 1,000 ft. With this radius an approaching vehicle can be seen 200 ft. ahead, and there is comparative safety with even moderately careful driving.

*Paper read at the Annual Meeting of the American Association of State Highway Officials, Omaha, Neb.

Unless the circumstances are very exceptional, on high speed main lines of travel, no horizontal curves of less than 300 ft. radius should be planned, and on roads of the very highest character of traffic almost any expenditure is justified in order to get such curves or even easier ones. A 300-ft. radius curve in a cut gives vision only 200 ft. ahead and this is little enough when two cars going thirty miles an hour will meet in two seconds after seeing each other.

Curves should, of course, be super-elevated and widened. This practice is now general in the several states, and while in most cases it has not proceeded far enough, more radical super-elevations are being used each year. It is our opinion that on curves less than 300 ft. in radius, super-elevations up to 1 in. to the foot are desirable. All curves of less than 1,000 ft. radius should be widened, the widening being greater as the radius of the curve becomes smaller. If radii as small as 300 ft. are used, the widening should be to at least 24 ft.

Where it is impossible to get curves with a radius of 300 ft. or more, if such a case exists, care should be taken to secure at least 200 ft. of vision ahead. Too many engineers are placing their curves so as to restrict the vision, when it is possible by throwing the ends of the tangents away from the bank to put in the same curve and still get vision past the bank. Bank cutting down to the line of vision is being practiced to some extent, but unless good maintenance is secured this is not as satisfactory as was expected.

Dead ends come under the same classification as curves. Dead ends are corners where the course of the main highway is not continued by an inferior highway, while the main highway makes a sharp turn. Treatment at such places should be just as radical as at curves, and added protection should be given by erecting white boarding across the dead end so that the driver is notified that the highway turns sharply. On such boards an arrow indicating the direction of the turn is helpful.

Something might be said about the acquirement of the inside of curves so as to keep the ground on the inside in low growing crops. In few cases is this necessary, because if the farmer is restricted as to what he can grow or build on a certain area, the same area might just as well be bought and the road located so that the proper curve protection is built in the structure itself.

The writer wishes to emphasize that the points of danger on our highways are at curves, and on high speed main lines of traffic too much money cannot be spent in securing good vision by building curves of easy radius. The fact that in every case an easier curve shortens up the centre line distance and thus reduces the amount of paving required, always helps to offset the additional cost of securing right of way for such curves, and if the highest class of pavement is being built, the saving in pavement often goes a long way towards paying the extra cost of an adequate curve.

Widths of Highways.

After curves, probably the factor producing the most danger and accidents is narrow surfacing. No permanent roadway should be built of a width less than 18 ft. on any main line of travel, and that 20 ft. is a much better and safer width. The writer does not believe in going over 20 ft. unless a width for four lines of traffic is desired, in which case 36 ft. should be the minimum, and 40 ft. would be much better.

It is the writer's opinion that on high speed roads pavements should be built in multiples of 10 ft. That is, 10 ft. should be provided for each line of traffic. It is also the writer's opinion that the so-called bastard widths are always dangerous. Such widths as 14, 15, 16, 24, 32 ft., and any other widths which do not provide a clear width of at least 9 ft. for each line of vehicles sought to be accommodated, are bastard widths and should never be used.

Large amounts have been wasted, or partially wasted, in building 14, 15 and 16-ft. pavements. If the traffic does not justify at least 18 ft., it is our opinion that a 9 or 10-ft. road should be built so that no one will be deceived

into believing that there is a double track road when none, in fact, exists. Such roads can be made double track roads later when funds become available.

In addition to the fact that wide roads are safer, they are also easier and cheaper to maintain, in that they keep the traffic off the edges of the pavement, and also provide for a moderate distribution of traffic.

Bridges and culverts should be built of adequate widths between endwalls. The distance between endwalls should be at least the width of the top of the fills when new. On main lines of travel not less than 26 ft. should be used as the distance between endwalls or parapets of bridges and culverts, and if the grades are wider, greater widths should be provided.

In the design of bridges and culverts, especially in the endwalls and railings, there are great opportunities for the beautification of highways. Artistic paneling or spindles add very materially to the appearance of concrete structures without adding materially to their cost. People are willing to pay for the artistic when they once have a sufficient number of samples of artistic bridges from which to judge the effects of good proportions and good design.

There is room for more artistic development in guard fence rails and in the construction of guard fences. Nothing probably adds more to the appearance of a highway than a well lined up and well constructed guard fence, painted white as it should be. Outside of the safety features of a guard fence, they add a feature of beauty to the completed road structure, if properly built.

Trees and Shrubbery.

Every tree which adds any beauty to the landscape should be saved, if possible, and where there are groups of trees offering effective relief it is worth while to make such changes in the centre line as will save these trees, even if additional right of way on the other side has to be secured. A good tree takes many years to grow and can be cut down in a few minutes. Most of us have been wasteful in our destruction of good trees and have not made the exceptions which should have been made in saving trees or groups of trees of distinctive character and merit.

As to brush and shrubbery. Within the limits of slopes, brush and shrubbery, as well as all other vegetation, have to go. In many cases, however, the clearing and grubbing limits are defined as wider than the slope limits, and thousands of acres of effective shrubbery and flowers have been destroyed which could just as well have been saved. In other words, the clearing and grubbing limits should follow the slope line. In the northern States, where snow drifting can be expected in many places along the roadway, low growing brush cannot be encouraged as it promotes snow drifting unless the line of brush is well back from the edge of cuts.

Incidentally we probably have not paid enough attention to buying additional right of way where snow drifts occur and planting shrubbery far enough back in the fields so that the snow will not be thrown into the road cuts. It is our opinion that this is the most effective form of keeping the roads open and should be used much more widely. The debate between shrubbery and snow fences as means of locating snow drifts, is probably close, but we shall not enter into it here.

If anything really effective is to be done it is the writer's opinion that it must be done by the state highway departments in cooperation with the state forestry departments, and not only must the trees be planted but they must be carefully attended to until they are old enough to take care of themselves. We will undoubtedly see advances in this direction within the next few years. With good care and judgment exercised in the selection and planting of trees of suitable character there is nothing objectionable about planting trees along highways and much to be said in favor of it. Even if in some cases a bonus has to be paid to abutting farmers on account of losses due to shading, it is well worth while from the public standpoint, and we believe it is possible to secure such relinquishments from abutting farmers where tree planting

is advisable at a very reasonable cost, considering the artistic effects and real benefits to be secured. Even in well timbered States there are sections where a little green on the landscape and a little shade is very welcome indeed. The general remarks as to trees apply also to shrubbery. Planted with discretion, shrubbery and flowers certainly add very much to the general roadside effect.

Grade Crossings.

In planning new main highways every possible effort should be made to secure the elimination of grade crossings. Much can usually be done in relocating the highways so as to avoid crossing the railways at all. Where two crossings with the same railway line lie within five miles of each other, it will usually be cheaper to buy a new right of way on one side of the track and to grade, drain, culvert and bridge the new right of way, than it will to separate the two crossings. If, however, there is something which must be met on the opposite side of the track, that is, a village or city, which it is necessary to accommodate, this course is not always feasible, although quite usually between the two crossings some point can be found where a separation can be made accommodating traffic to and from the city or village in question, while the main line of traffic is left free.

Each case has to be decided upon its merits but both undergrade and overgrade crossings have disadvantages in alignment, and the best solution in four cases out of five, where the crossings are not too far apart, is to relocate along side the track. Where a highway has to cross a railway an overhead is quite usually superior to an undergrade crossing for several reasons, and is usually less expensive.

Up to very recent years, about two out of three grade separations built by the railroads have, in reality, been more dangerous to highway traffic than are grade crossings, because the railroads paid no attention to the matter of highway alignment and used in almost every case crossings perpendicular to their tracks with two sharp and sometimes blind approach curves. Such crossings are seldom, if ever, satisfactory where the highway is in general paralleling the railroad as many main highways naturally do, and when skew crossings have to be built the decision almost inevitably falls upon relocating the highway.

Highway intersections, especially high speed intersections, are another source of grave danger. All intersections should be well signed on both highways and in addition good Y's should be put in in each direction, because such Y's serve to increase the vision for the traffic which crosses perpendicularly, and the traffic which makes the turns fits into line much better if its course is changed as it comes into its new line of travel.

At many crossings of two supremely important highways it is undoubtedly going to be necessary to separate these highway crossings just as railroads have found it necessary to separate their important crossings. This may sound extreme, but where such cases exist on really important lines of traffic, there can be no doubt that the separation of the two roadways is not only desirable but an economic necessity.

Roads Under Construction.

If a road is to be kept open to travel during construction, the safety and convenience of the traveling public should be the paramount consideration rather than almost totally disregarded and the traveller considered as an interloper, as is the case in too many instances at the present time. Roads under construction should either be wholly closed to general traffic, or kept open under conditions which guarantee safe and easy passage.

If kept open, grading should be kept closely in hand. On ordinary roadwork there is no great reason why there should be more than one mile between the completed grading and the first plowing ahead. Contractors would be, in most cases, much ahead if instead of spreading their work over the whole length of the contract and finishing

nothing until the last operation, they would keep the grading operation well in hand and finish as they go, starting a slope trimming and finishing crew as soon as the roughing out has proceeded not over a mile.

Too heavy lifts are used on many highway jobs. That is, three or four feet off the end of the fill. This is contrary to most specifications, makes a poor road, badly compacted, and besides gravely inconveniences the travel both in going up and down the breast. Even where the cut is not completed or where the fill is not completed, it can be kept reasonably smooth by operating a grader constantly over it as the material is being cut and filled.

The most striking difficulty on roads kept open during construction is the short detours around culverts and bridges. In the case of bridges, wherever the alignment permits, it is much better to build the bridge on a new site even at a cost of a few hundred dollars additional, and permit the traffic to use the old bridge rather than a temporary structure. In quite a reasonable number of cases curves happen near bridges, and it is possible by a new alignment at the point to build a new bridge and maintain the old one during construction.

In the case of culverts, instead of detouring the traffic across the ditches and through fields, usually in impassable condition after each rain, we should build the culverts in two sections. While slightly more costly to do this, the additional cost is made up many times in savings to traffic. We have experimented with this during the last season and our plans and specifications for next year are going to call for the construction of culverts in two sections wherever we expect to keep the road open for traffic.

Detours.

In some of the eastern States roads have been built in halves and the traffic dispatched in a single direction by a system of telephoning. We, this year, travelled over sections of highway so handled, and it was our impression that for a main line of traffic this method was totally unsatisfactory and that if the money expended in dispatching and in additional cost of construction under such conditions had been spent in temporarily fitting a detour or detours for traffic, the result could not help but be more satisfactory, unless there was positively no available detour.

Where highways under construction are to be absolutely closed and traffic detoured, considerable attention should be given to these detours, and the road over which the detour is to be carried should, if possible, be given the proper amount of attention the preceding year. Where opportunity exists it is much better to put in a detour for one line of traffic, and to use another highway for traffic going in the opposite direction. If the roads on which the detours are placed are necessarily narrow, this avoids many complications in meeting, and many accidents, and facilitates the passage of both lines of traffic. Further the detour roads are not quite so seriously damaged if the traffic is halved. We feel that where there is any question of reasonable doubt the double detour should be used.

A good many present day highways must be detoured when constructed. It is practically impossible to construct a concrete road without detours. The same is true of almost every road except gravelling and grading jobs. But the cost of detouring is a very heavy charge upon the travelling public. Almost invariably the detours are longer than the road under construction, and if the road under construction is a heavily travelled one, the cost to the traffic of making a detour, even one mile longer than the straight road, is very heavy. For instance, a detour three miles longer than the main road, carrying a traffic of 800 vehicles a day, means a daily total of extra travel of 2,400 miles, which even at 10c a mile is \$240 per day. If the road under construction is kept closed for four months, the cost of detouring would be \$28,800, and unless the structure is of such a character as to absolutely preclude taking traffic through, any reasonable expenditure in keeping it open for traffic can be seen to be fully justified.

Something can be done for both safety and beauty by proper maintenance. Brush interfering with vision at corners should be kept well cut, and the roadside should be kept mowed. All signs directing traffic, both on main roads and detours, should be well maintained. Engineers usually go through the work itself and very seldom use the detours, and we have discovered cases where practically all signs were down on detours without the men directly in charge knowing it, because they never used the detour but went through the work.

Detours should be in charge of the maintenance department and not the construction department, and the maintenance engineers should travel the detours whenever such exist.

Build safety into the structure by proper design rather than expect to provide safety by large expenditures of paint and signs after blunders are made. Without proper design, maintenance can do little toward providing safety except in cases of disaster to the road structure. Maintenance can, however, add to the beauty factor by providing well kept surfaces, shoulders, and ditches, and by keeping all signs and attendant structures well painted or clean. Maintenance can add to safety also by properly cutting shrubbery and trees which interfere with vision.

Conclusions.

Both from the standpoint of safety and beauty, the future fate of any section of highway is practically decided by the original layout and by the design of the highway and its structures. Some beauty can be preserved by care in not ruthlessly destroying during construction, but much more can be saved of the thought of preserving worth while beauties is in the mind of the designing engineer. Surveyors should accurately locate trees and other features of especial aesthetic value and should, if possible, determine methods of saving these features while in the field making the original surveys.

It is almost impossible to spend too much money in promoting safety on our main highways. It is probably likewise almost impossible to spend too much money in the promotion of beauty, because no state will get very far with the promotion of beauty before it will be stopped by the protests of its taxpayers. The taxpayers will stand for a large dose of expenditures for the promotion of safety, but they are not yet ready to spend very large amounts in the promotion of beauty. This last is a matter of education, while much of the education along safety lines has already been acquired. It is the author's opinion that we cannot possibly be too extreme in the design of highways in regard to all factors which make for public safety.

With the exception of so few that they are scarcely worth mentioning, I do not know of one American highway, built ten years ago which is today adequate for the traffic upon it. Either it fails as to width, or it fails as to adequacy of surface, or it fails as to safety features, to measure up to today's standards.

A state highway department which is not being severely criticised because of its drastic relocations, because of its drastic treatment of curves, because of its drastic treatment of widths, is not measuring up to its responsibilities of leadership in American highway development. We should all go as far as we dare go, and then venture a little further, because only so will we even approach the standards of tomorrow. May we all have the vision and the courage to plan and build aright!

SOME ECONOMIC ASPECTS OF HYDRO-ELECTRIC POWER DEVELOPMENT.

At the final session of the symposium on water power development held recently at the University of Toronto, Norman R. Gibson, hydraulic engineer of the Niagara Falls Power Co., Niagara Falls, N.Y., lectured on the economic aspect of hydro developments. He pointed out how the growth of power plants has followed the old economic

law, the cheapest product in the dearest market; in other words, power plants are first developed where the cost of development is lowest and where the disposal of power is easiest due to either lack of competition or high cost of other power.

In this manner the production of hydraulic power in Canada, where there is little coal, represents about 93% of the total central station output, while in the United States, where coal is abundant and moderately cheap, hydraulic power represents only 37% of the total central station development.

Mr. Gibson pointed out that the low cost of power is not a necessary requirement for the domestic market, such as large cities, where the bulk of the use is the individual consumer, but that low cost is vital for large industries whose output depends entirely on cheap power; the production of aluminum, chlorine and caustic being instances of the latter.

The effect of the diversity factor on the sale of power was pointed out and it was found that due to overlapping of the requirements of various consumers, the power plant owner can frequently sell from two or three times the horsepower capacity of his plant. This sometimes led to an apparent discrimination in rates, and was frequently advanced as an argument for the selling of power on an energy rather than on a capacity basis.

The items that must necessarily enter into the rate for sale of power are:

1. Operating expenses, comprising labor and supplies and small maintenance repairs.
2. General overhead, comprising expenses of manager, superintendents, and general overhead.
3. Municipal and Government taxes.
4. Depreciation and obsolescence.
5. Interest on invested capital, or profit.

Particular stress was laid on the fourth feature, namely, the setting aside of a certain income each year to return to the investor when the plant is worn out or has become obsolete. The determination of the rate to cover this feature is a subject of much investigation, and by its very nature can never be accurately determined.

Mr. Gibson closed his address by pointing out the practical impossibility of making close estimates, either for capital cost or for annual charges of projects which go beyond the limits of previous experience, as conditions always arise which nobody could possibly foresee.

Mr. Gibson showed several slides of the various developments of the Niagara Falls Power Co., indicating the progressive development in the art to meet the advancing economic requirements.

CALGARY CONFERENCE ON ALKALI PROBLEM

REPRESENTATIVE engineers and chemists of Western Canada are meeting in Calgary this week to discuss the very important question of the effect of alkali on concrete. The Concrete Committee of the Engineering Institute of Canada has been summoned to confer with Duff A. Abrams, professor at the Structural Materials Research Laboratory of the Lewis Institute, Chicago.

In addition to his conference with the Concrete Committee, Prof. Abrams will address the Engineering Institute in Calgary on "Scientific Methods of Mixing Concrete."

Following are some of the members of the committee who are conferring with Prof. Abrams: Prof. C. J. McKenzie, dean of engineering, University of Saskatchewan, who is the chairman of the Concrete Committee; Prof. Findlayson, dean of engineering, University of Manitoba; A. S. Dawson, chief engineer, C. P. R. Department of Natural Resources; Prof. R. L. S. Wilson, University of Alberta; A. H. Haddow, city engineer, Edmonton; Prof. J. A. Williams, University of Saskatchewan; Dr. Thorwaldson, University of Saskatchewan; Dr. Shipley, University of Manitoba; W. P. Brereton, city engineer, Winnipeg; Dr. J. A. Kelso, University of Alberta; F. C. Field, city chemist, Calgary; and George W. Craig, city engineer, Calgary.

PROBLEMS IN SEWER DESIGN AND MAINTENANCE*

Poor Design Will Result in High Maintenance Costs — Efficient Sewerage and Drainage System at Baltimore — House Connections

By Milton J. Ruark,

Division Engineer of Sewers, Baltimore, Md.

DESIGN and the maintenance of a sewerage or drainage system are two distinct and independent functions. Usually the engineer responsible for the designing is especially trained in this particular branch of engineering; is qualified to make the necessary surveys and calculations, and can execute detailed plans and specifications to the satisfaction of the State Board of Health or other authorities. Unfortunately, however, the consulting or designing engineer seldom has the opportunity to operate and maintain the systems, which he has planned. His knowledge of maintenance problems is, therefore, mostly obtained from others, and is not his own experience. It is, therefore, to be expected that he will not be able to anticipate all of the maintenance difficulties, some of which may be due to local conditions, and the burden of successfully operating the system must be solved by someone else who may or may not be particularly qualified or have knowledge of the principles involved in the original design. If the engineer has exercised ordinary skill, and given sufficient thought and study to the subject so that the proper and most suitable system is adopted; if designs are prepared and detailed in an accurate manner; and, furthermore, if the plans and the specifications have been followed out by the engineer in charge of the construction, it is safe to say that maintenance problems should be few, and of such a character that only minor modifications to the system will be required, and the operation cost will therefore be small.

On the other hand, maintenance problems are often numerous, difficult to correct, and involve unreasonable up-keep charges because the sewerage system has been either poorly designed, or as is more commonly the case, constructed in haphazard manner without sufficient engineering supervision. Where the designing engineer of the system is one who is familiar with the maintenance problems, he will, of course, avoid many errors and pitfalls that he has become aware of through experience.

Baltimore Drainage System.

The Sewerage and Drainage System of Baltimore, approximately 90 per cent of which was built between the years of 1906 and 1916, has now been in service about 10 years. At the time when preliminary plans were submitted and approved, there was much difference of opinion as to the best methods of design to follow. In a great majority of instances it is clear and beyond dispute that the designs of the engineers, adopted and carried out in detail, were the best ones although there are a few cases where equal or better results might have been obtained by using some other and perhaps less expensive method.

One of the chief results to be obtained by the sanitary engineer is a sewerage system that will be free of obstructions, chokages and foul odors, and which can be kept in this condition by ordinary maintenance labor. The prevailing impression is that if the grades of the sewers are sufficiently steep no trouble will be experienced with deposits forming in the sewer. The problem, however, does not end with the designer. He may have provided for sufficiently high velocities, and nevertheless when the sewer is put in service obstructions will frequently occur especially if good construction work is not insisted upon.

Trouble Through Tree Roots.

More important than good grades is a selection of good quality pipes, and skillful pipe laying. Pipe must be

smooth, straight, and in continuous alignment throughout without the irregularities and kinks which so often occur due to the interference of other underground structures. Each joint must be made as tight as practicable, and the well established principle of straight horizontal and vertical alignment between properly spaced manholes must be observed. One of the chief causes contributory to obstructed sewers is tree roots. Where skillful pipe layers are employed, and good tight joints are made, the probability of an obstructed sewer from this cause is reduced to a minimum. Roots from the common poplar tree are responsible for most of the trouble in Baltimore, and occur more frequently in the house connection than in the lateral sewer. This trouble, however, has not been experienced in storm water drains, and is probably accounted for by the fact that small drains carry little or no flow during dry weather. Even where bituminous compound joints have been used as a precaution against tree roots, they have found their way into the sanitary sewers. It is a recognized fact that poplar trees have little value as shade trees, and that the roots also cause failures of cement or brick sidewalks. For this reason an ordinance has been passed in this city prohibiting the further planting of this species of tree. The demand and market for many of the complicated mechanical sewer cleaning apparatus so widely advertised by manufacturers is due to the fact that many municipal sewerage systems in this country have been poorly designed and constructed.

Plumbing Regulations.

When the sanitary sewerage system of Baltimore was put in service, each building, premises and establishment was required to be connected to the sewerage system at the expiration of 60 days after being notified by the Health Commissioner. The regulations required that the existing plumbing be made to conform with a revised plumbing code under which all wastes of a polluted character were required to be disposed of into the sanitary system, and rainwater or other non-polluted waste into the storm water system. Rain leaders, which were permitted to be discharged upon the surface, were connected to the storm water system at the option of the property owners. These regulations were enforced in all instances ever where a building was connected to a private sewer, and considerable money had to be spent in rearranging existing plumbing to conform to the new regulations. In cases where property owners failed to comply with this notice within a reasonable time, the health authorities had the power to make these connections to the city system, and the cost of the work became a lien upon the property. Where the property owner was not able financially to do this work, the city also arranged to have the work done by the owner's plumber, the owner paying the cost, with interest, in five annual installments. The rigid enforcement of the above regulation; the elimination of all cesspools and old outside running traps, which are still in use in many cities, has done much to improve sanitation in Baltimore.

Notwithstanding that the reconstruction of the house plumbing and the cost of making sewer connection has involved an expenditure, according to the least conservative estimate, of \$8,000,000 on the part of the property owners, it has been demonstrated that the benefit derived has justified the course taken by municipal officials. In the business districts the majority of down-spouts are connected direct to the storm water drainage systems. The practice of making separate connections to the storm water system has increased, and it is a question whether it is not better to provide a separate connection in order to dispose of all water from roofs, area-ways, subsoil drainage, and water from garage floors. If this practice were followed, large quantities of rain water would be eliminated from the surface of streets; but some authorities claim that it is better to discharge water on the surface, as it tends to keep the streets in a cleaner and more sanitary condition.

With the exception of a few low-lying drainage areas there are no catch basins in Baltimore, and it is not likely

*Paper read before the American Society for Municipal Improvements.

any will be built in the future. Most of the storm water drains are self cleaning; and the building of catch basins would therefore serve no useful purpose, but would probably become a nuisance. Catch basins are very expensive to clean out. They soon fill up with silt, and it is difficult if not impossible to prevent street sweepers from disposing of street sweepings in these inlets in order to lessen their labor. Furthermore catch basins often retain a good deal of decomposed matter, and they cause complaints because of odors, and prevent a free circulation of air through the drainage systems.

Marking Manhole Covers.

Although the design in manhole covers would seemingly play an unimportant role in sewer design, there is room for much improvement along this line. Where the separate system is used, covers for sanitary sewer and storm water drain manholes should be clearly marked with such words as "Sanitary Sewer" and "Storm Drain" so that all municipal employees can tell the kind of sewer without taking the cover off. A penalty should be imposed for removing these covers, and the amount of the fine should be marked on the sewer. Where the separate system of sewers is used, the manhole frames and covers should not be of the same size for both systems. Unless the covers are of slightly different diameters they will be interchanged and cause much confusion in maintenance work. For example, snow is likely to be dumped into sanitary manholes under the impression that it is being disposed of into the storm water drains, which practice causes much trouble.

During the early days of the Baltimore Sewerage Commission six holes, each 1 in. in diameter were provided for in the top of manhole covers for ventilation and for removing them. As the sewers get ample ventilation through the house stacks this number was reduced to two without any ill effects. Were it not for the fact that some means have been provided to take the covers off, no holes would be put in them at all. A good deal of ground water would thus be eliminated from the sewerage system which is treated at the sewerage works.

Complaints have been made because of loose manhole covers which rattle when traffic passes over them. Experience at Baltimore has shown that the best way to remedy this condition is to have all manhole frames and covers inspected at the foundry. Only those castings that fit well are selected. They are bought by the city, and furnished to the contractors who are building sewers.

Although lampholes were built on the sanitary sewers of Baltimore when the system was first installed, this practice has since been discontinued. They are a source of trouble as mischievous children remove the lamphole covers with little difficulty, and drop sticks and rubbish in the sewers, which become choked. If sewers become obstructed, lampholes are of little or no value in clearing them, and it is seldom that they facilitate maintenance work in any manner whatsoever. Furthermore, even when carefully constructed the lamphole will frequently settle and break away from the lateral sewer due to unequal settlement. House connections, which are made from deep sewers by means of standpipes, are also a source of many troubles due mostly to settlement.

Garage Connections.

It is unlawful in Baltimore to connect garage floor drainage to the sanitary sewers. Thus, one of the main causes for gas explosions in sanitary sewers is prevented, although explosions have caused serious accidents in many cities. There is no record of explosions in any of the Baltimore sewers. It is permissible to connect garage drainage to the storm water drains, but the plumbing regulations require that an approved trap of ample capacity be installed on the house side of the sewer connections so as to intercept any gasoline or oils that might otherwise flow into the storm water drain.

One and one-quarter inch taps from the water mains of the city were originally extended to each terminal or

dead-end manhole as the occasion required. The practice of installing these taps has also been discontinued as it has been demonstrated that only occasional flushing is necessary, and that the connections often rust out and become leaky in a short period of time. For similar reasons the use of flush tanks has been limited to serve sewers which are laid on very flat grades, and their use ever under these circumstances is questionable. Moreover, there have not been many complaints of deposits in sanitary sewers that are at or near the end of the lines.

In Baltimore four men spend all their time in making periodic inspections of all manholes. They remove from the manhole benches such things as sticks, rags, bottles and other material that might choke the sewer. Often they find that some sewers are partially obstructed, and they immediately have these obstructions removed. This work reduces the amount of money expended in clearing the sewers, and at the same time there are fewer complaints from property owners because of flooded cellars.

Sewage Pumping Stations.

A gravity system of sewers should be installed whenever it is possible so as to reduce pumping to a minimum. The design of a pumping station, either large or small, requires very careful consideration and a vast amount of detail work. Extreme caution must be exercised that the proper type of mechanical and electrical equipment is selected. Ample space for units to meet future requirements must be provided, and reserve units must be installed in case of a breakdown. The average daily flow at the main pumping station in Baltimore is 25,000,000 gals. and the maximum flow has at times reached 38,000,000 gals. per day. Nevertheless, this station has been in continuous service without interruption, and the successful operation of a station of this size is assured if the equipment is first class, kept in good repair, and a competent, reliable staff of power plant operators is provided. That pumping stations of both large and small capacities can be located in congested districts without becoming objectionable to adjacent property owners, and further that sewage screenings can be disposed of by incineration within the pumping station without causing a nuisance has been clearly demonstrated by the operation of such a station in Baltimore.

Sewage Treatment.

One feature of sewage treatment that has demonstrated itself is that it is practically impossible to eliminate complaints because of odors from a large plant. A sewage treatment plant of any size is bound to give off odors and the engineer who claims that he can eliminate them altogether will be disappointed when he faces actual operation conditions. Theoretically a certain method of sewage treatment may be used without producing odors, but when all weather conditions are encountered, when wide variations in sewage flow occur, and when the plant is operated by poorly trained men who are negligent, aerial nuisances almost invariably arise. Very often complaints from odors are unfounded or are exaggerated. Human psychology is such that people, who live in the vicinity of a sewage treatment plant, often imagine that they get odors from the plant when such is not the case. Where the land can be bought at a low price, it is advisable to buy a large tract as was done at Baltimore in order to isolate the plant, and reduce the number of lawsuits which are bound to follow. After the plant is built, any land bought in the vicinity of the plant can be resold with the provision that the purchasers will not enter suit against the municipality.

Improvements In Design.

Within the past 10 or 15 years great advances have been made in sewer design. The rational method of designing storm water drains has been introduced. The separate system is becoming more firmly established. A great deal of information has been compiled as to the hydraulics of sewers, and many other valuable data have been obtained. But much remains to be done. Engineers should ascertain with a greater degree of accuracy the value and

advisability of using concrete for sewers as compared to terra cotta vitrified earthenware pipe, the effect of various kinds of sewage and industrial waste flowing under different velocities and conditions both in concrete and brick lined sewers, and the life of these materials under such conditions. Engineers should as a matter of public service make a more detailed study of the storm water run-off from various kinds of pavements, etc., the percentages of water entering different types of inlets under varying surface grades and conditions. It is true that engineers have not learned the last word pertaining to the design and construction of sewers, but much ground has been covered. The most fertile field for investigation and research in sanitary sciences lies in the field of sewage treatment, and it is not unlikely that within a few decades our present methods of sewage treatment will give place to other methods, which are more economical and efficient.

POWER HOUSE MACHINERY

AT the recent symposium on water power development held at the University of Toronto, the fifth lecture was by W. M. White, chief hydraulic engineer of the Allis-Chalmers Co., Milwaukee, who spoke on "Power House Machinery." This lecture was well attended and proved very instructive to the audience. Mr. White prefaced his talk with an illustration of the manner in which modern progress is in direct proportion to the use of power, showing how developments in any district are followed by rapid industrial and social growth. The Niagara district, the Montreal district, the Southern California district, Japan and Formosa all furnish typical instances of such growth. The Japanese Government has proved this fact to their own satisfaction to such an extent that they are proceeding with a 150,000 h.p. development in Formosa, even though the present demand there is not in excess of 10,000 h.p.

Slides were used by Mr. White showing the various construction details of turbines, illustrating the finer considerations of design. The use of varying angles of the speed ring vanes to compensate for the relative increase in velocity on the inside curve of the scroll case was illustrated. Details of construction and illustrations of the plate steel scroll case were presented in a very interesting manner. The methods of designing the runners to maintain full buckets with the water in complete contact with the vanes at all times was pointed out, and the effect on the runner by pitting was graphically shown.

Mr. White pointed out that there were two functions required of the draft tube, one to form a seal between the runner and the tail water, and the other to return to the runner the energy contained in the water when it entered the draft tube. The development of the hydracone from experiments in 1904 of a jet impinging on a flat plate through various forms of discharge surfaces was discussed, and numerous illustrations of the hydracone installations were shown.

The development of the high specific speed type runner was then taken up and an interesting slide shown illustrating a propeller-type runner now being built in the shops of the Allis-Chalmers Co. for the Ford plant near Albany, N.Y. This runner is 13½ ft. in diameter, and will deliver 2,000 h.p. under 17 ft. head. The specific speed is approximately 150 (in English units), and it is in appearance much like a ship propeller with four flattened blades.

After showing further slides indicating especially interesting features in various plants, such as the direct-connected fly-ball governor developed by Mr. White, and a head increaser by the utilization of the flow over a dam to act as a "puller" on the tail race under the dam. Mr. White closed his address by pointing out the virtue of developing concentration and a "sixth sense" in all hydraulic work, with particular reference to testing.

Wellington County last year spent \$270,604.86 in the construction of county roads and in Puslinch township \$131,319.74 was spent on good roads.

BIG ROADS PROGRAM FOR QUEBEC.

ABOUT \$7,500,000 will be spent on Quebec highways this year according to the good roads program recently announced by Hon. J. L. Perron, Minister of Roads in the Quebec Cabinet. The money will be apportioned as follows: Regional roads, \$3,450,000; Municipal work (by day and contract) \$2,100,000; Rebuilding and upkeep \$1,450,000; Special works and administration, \$500,000.

The road work will be performed in three divisions which for the purpose of this work have been made in the map of the Province.

District No. 1 includes the following counties, Gaspé, Bonaventure, Matane, Rimouski, Temiscouata, Kamouraska, L'Islet, Charlevoix, Montmagny, Bellechasse, Lévis, Lotbinière, Dorchester, Beauce, Mégantic, Wolfe, Frontenac, Lake St. John, and Chicoutimi.

District No. 2 includes the following counties, Compton, Sherbrooke, Stanstead, Richmond, Chateaugay, Beauharnois, Arthabaska, Nicolet, Drummond, Yamaska, Huntingdon, Brome, Shefford, Missisquoi, St. Hyacinthe, Bagot, Rouville, Naperville, Richelieu, Iberville and St. John.

District No. 3 includes the following counties, Quebec, Montreal, Portneuf, Champlain, St. Maurice, Maskinonge, Berthier, L'Assomption, Joliette, Montcalm, Chambly, Vercheres, Laval, Jacques Cartier, Two Mountains, Terrebonne, Argenteuil, Vaudreuil, Soulanges, Labelle, Hull, Pontiac and Temiscamingue.

Work has commenced in some sections, some more contracts will be awarded this week, and by June 15 the entire province will be engaged in road-making and this will keep up until September 15 when the entire programme will be completed.

Leading District No. 1.

Important work is planned for this district in the coming season. This district comprises the entire lower part of the province, Lake St. John, Beauce, and a section of the Eastern Townships. In this district are located the Lévis-Rimouski route, the Rivière du Loup-Edmundston and the St. Alexis-Jonquière, and also the first section of the Lévis-St. Lambert route up to the limits of the counties of Nicolet, and about half of the Victoriaville-Woburn route. There are still several important contracts to complete in this district, and a great deal of the work will be done by day in the various counties in this part of the province.

As far as the Lévis-Rimouski route is concerned, there is a good part of this road already improved, and this year there remains the task of making the worst sections passable, so that the road is free for traffic from one end to the other. Important work on the Lévis-Montmagny section of this road, and also for other sections in the counties of L'Islet, Kamouraska, Temiscouata and Rimouski.

The Rivière du Loup-Edmundston road will be finished this year. The Roads Department recently let a contract for the construction of that part of it known as Ste-Rose du Degele, near the borders of New Brunswick and work has already begun at that section.

Important work will also be done this year on the St. Alexis-Jonquière road, notably in the municipalities of St. Ambroise and Chicoutimi Canton. This road will provide the first trunk of the Chicoutimi-Roberval road and will serve the entire Lake St. John district.

In district No. 1 there will also be the construction of the Lévis-Lotbinière section of Lévis-St. Lambert road on the south shore. Part of the Victoriaville-Woburn road is also under the control of the organization in district No. 1, in the counties of Frontenac and of Wolfe. Work continues throughout the year.

The Woburn and Whittton sections are notably features of this year's work. This road crosses the Eastern Townships diagonally, and is also known as the Portland-Three Rivers road.

An amount of \$200,000 has been set apart on the 1922-23 budget in district No. 1 for rebuilding and up-keep work. This rebuilding work consists principally of the macadam

built eight or ten years ago, in the early days of the good roads act. In most of these instances, the work will be a resurfacing of the worn out top and covering with oil. The Department of Roads is now asking for bids for this work.

Bids will be asked very soon for the construction of these 22 miles located between the city of Quebec and Ste. Anne de Beaupre.

District No. 2.

Provincial and regional roads.

The projected work on the regional and provincial roads for this section in this district will be the following:

Montreal-Sherbrooke road—Bids to be asked 16.58, length under contract 23.66 miles, bid asked 27.58 miles.

The part where bids have not yet been asked comprise the canton of Granby, the parishes of St. Paul d'Abbotsford and Rougemont, as well as the village of Rougemont. Preliminary survey work will be commenced in a few days and bids will be asked for in a month.

The construction of the Levis-St. Lambert road from Corel to Montreal is on this season's program. The part located in district No. 2 extends from Sorel to Contrecoeur, and is 9.92 miles long.

Work on the Richmond-Yamaska road commenced about the end of 1921 season. The season of 1922 will see the construction of 8.17 miles, comprising the section between Richmond and Drummondville.

Levis-Sherbrooke road—Length built 51.80, total length in No. 2 district 74.29 miles, length to be built in 1922 18.49. The stretch of 18.49 for the season of 1922 will complete this road in district No. 2 except for four miles in Shipton canton, Richmond county. The building of these four miles will be begun as soon as possible.

Laprairie-Lacolle road (via St. John)—Length built 2.47, to build under contract 1.75, for 1922 1.75 miles.

Work By the Day.

A substantial sum has been set aside for municipal work in the different counties of district No. 2. Works of considerable magnitude are down on the programme for 1922 in nearly every municipality of the Eastern Townships and in the Richelieu district, as well as the counties of Laprairie, Napierville, Chateaugay and Huntingdon forming part of this district.

Gravel seems to be particularly favored in this region, but macadamizing is being done in several municipalities. Improvement of roads has been carried on to a considerable extent in every section of the province comprised in this district No. 2, and certain municipalities have improved every one of their roads.

Rebuilding.

Rebuilding will be carried out during the season in No. 2 district as follows:

1—On the Caughnawaga-Malone road, in the municipalities of Ste. Martine, Tres St. Sacrement, Howick, St. Malachie d'Ormstown, village of Ormstown, Godmanchester, and the town of Huntingdon, all of which is to be done within the counties of Chateaugay and Huntingdon. The total length of the rebuilding to be done is 23.43 miles.

2—On the Laprairie-Valleyfield road, in the municipalities of St. Joachim of Chateaugay and the village of Lery, over a distance of 5.02 miles.

Laprairie-Valleyfield road—Length under contract 4.5 miles, bids to be asked 2.5 miles.

3—On the road between Valleyfield and Ormstown, in the municipalities of St. Malachie d'Ormstown, St. Louis de Gonzague and Ste. Cecile de Beauharnois, over a distance of 3.55 miles.

4—On the Sherbrooke-Norton Mills road, in Compton canton, for 7.47 miles. This section of the road is situated between the town of Sherbrooke and the town of Coaticook.

5—On the Montreal-Sherbrooke road, in the village of Richelieu, for a distance of 0.92 miles.

Besides this rebuilding of the main roads there are also other important rebuilding projects, bids for which will be opened shortly. These are as follows: In the Dun-

deed canton 9.12 miles, in St. Constant parish 4.61 miles. The estimated cost of all this rebuilding work in district No. 2 is set down as \$430,000 for this year.

Upkeep.

There is upkeep work projected for district No. 2 in 240 municipalities on a length of 1,000 miles.

District No. 3.

Montreal-Mont Laurier road—Total length 152 miles, length under contract 37.44, bids (rebuilding) asked five miles, length to complete 15.71 miles, bids to be asked 93.85 miles.

The 37.44 miles under contract will be terminated this season, as well as the five miles of rebuilding.

Montreal-Hull road—Total length 112 miles, length built 23 miles, length under contract one mile, bids to be asked 69 miles, bids to be asked (rebuilding) 19 miles.

All the rebuilding necessary and the construction of that part of the road between Montreal and Lachute will be completed this year.

Levis-St. Lambert road—Section Montreal to Sorel—Total length 37 miles, bids asked for construction 18.5, bids to be asked (rebuilding) 7.5 miles, length completed 11 miles.

Quebec-St. Simeon road (Quebec to Ste. Anne de Beaupre)—Length from Quebec to Ste. Anne 22 miles—Bids will be asked very soon for the construction of these 22 miles located between the city of Quebec and Ste. Anne de Beaupre.

Montreal-Toronto road (length 46 miles)—Along this entire road there are only the parts situated in the parish of St. Zotique, village of St. Zotique and the parish of Ste. Claire-d'Assise, 7.24 miles which have to be completed. The rest figures in the rebuilding program. This 7.42 miles will be built this year.

BEARDMORE-TOSI ENGINE TEST.

SUCCESSFUL tests have been made with a Tosi type internal combustion engine built by William Beardmore & Co., Glasgow. The engine, which is one of the several which are being built in the Beardmore shops for cargo vessels now under construction, is of the four-stroke cycle single-acting six-cylinder type, designed to develop over 1200 b.h.p., and on a 100 hours' trial gave an average brake horse-power of 1267 on a fuel consumption of .42 lb. per brake horse-power per hour. In reversing tests, the time of the change over from full ahead to full astern was 8 sec. This unit is to be installed in a single-screw vessel of 2000 tons, the Pizarro, which will be launched during the present month.

WORK ON YORK COUNTY ROADS.

CONSTRUCTION is well under way in York County on the good roads system. Large quantities of building materials are available and in twenty different sections of the system, existing earth roads are being prepared for a suitable base and permanent surfaces are being laid. The work is being carried on with the minimum of interference with traffic movement and where detours in the system are necessary they have been carefully laid out.

The work is spread out over the whole system. Sections of men have taken over 1 1/4 mile blocks at different points and have the preparatory work well under way. The greatest activity at present centres round Todmorden, Highfield, Weston, Agincourt, Unionville, Sutton, King and Downsview though a considerable amount of work is being undertaken in other sections.

The beginning of the 1922 program brings to light the fact that, in common with almost everything else, road building costs have decreased. Taking all factors, it is estimated that the cost of constructing a given length of road is from 10 to 12 per cent. less than it was in 1921.

PLANT INSPECTION TO INSURE GOOD BITUMINOUS PAVEMENTS*

Three Cases Cited Where Lack of Inspection Resulted in Failure of Road — Details of Each Case and Cause of Failure.

By Francis P. Smith,

Consulting Paving Engineer, New York City.

ANYONE who has thought of the subject of this paper and is familiar with the various processes of construction regards it as an axiom that plant inspection is a necessity. It is a fact, however, that in all highway organizations there are a number of officials and engineers who have not made a special study of bituminous construction. Let us assume, for the minute, that we are in the position of an engineer who has not specialized in bituminous construction. Certain contracts have been let in his district for asphalt pavements. His appropriation is more or less limited and perhaps he is doubtful as to the real necessity for plant inspection. After the foundation has been laid and is ready for the bituminous top, he visits the plant. He finds it in operation apparently running all right, the batches being turned out and the sand assembled and fed to the dryers and the trucks are leaving with fair regularity and the mixture looks all right. It is black and the sand seems to be fairly well coated. He takes a sample from the load and tests the temperature and finds it comes within the limits of the specification requirements. From there he goes to the road where he finds the trucks delivering the hot asphaltic mixture. It is being shovelled, spread and rolled in good workmanlike manner and he comes back to his office and thinks: "What real necessity is there for an inspector at the plant? Everything seems to be going all right, and why visit the plant more than once a day and the street occasionally? Why is not that sufficient?" and so he lets it go at that, and if he is fortunate enough to get a good pavement he is liable to come to the conclusion that plant inspection is not a necessity but a more or less expensive luxury which can be omitted when appropriations are scanty. There is another side to the question, however, and as I firmly believe that it is true that we learn more from our own failures and mistakes than from any other source, I am going to cite certain failures which were wholly due to inadequate inspection as possibly the best way of emphasizing the point which I am here to make.

Three Cases Cited.

Fortunately for my illustration, within the last three years, three failures of bituminous pavement have come to my attention. In all of these cases it happened that I was entirely familiar with the circumstances attending their construction, the kind of materials used, the personnel of the contractor and the engineers under whose direction these pavements were laid.

In the first case, the engineer decided to limit his inspection to daily visits to the plant and street supplemented by a daily analysis of a sample taken when he visited the street. Instead of a complete analysis he determined the bitumen content only, on the theory that the amount of asphalt that went into a bituminous road was one of the most important elements to check up and that as the asphalt was the most expensive ingredient of the pavement he would be more likely to find a shortage there than in any other constituent. In this instance he was drawing on his experience in concrete construction work.

In the second case, the engineer decided against complete inspection, but he or one of his assistants took a daily sample of the mixture and had a complete analysis made of it.

*Paper read before the Eighth Annual Conference on Highway Engineering at the University of Michigan on February 14, 1922.

In the third case, the engineer was convinced of the necessity of plant inspection and he assigned a good inspector to cover the plant, and had daily complete analyses made of the mixture but he thought the street gang could get along all right. This case is perhaps outside the limits of my subject but seems to me of sufficient importance to warrant the liberty of including it in my paper.

In the first case cited, a single sand was used and this sand had been examined carefully and approved as suitable for the construction of a sheet asphalt pavement. In the second case, two approved sands were used and they were supposedly mixed in the proportions designated by the engineer while in the third case, only one sand was used and there was practically no street inspection and the street gang was composed of unskilled and incompetent men. Still keeping the preliminary conditions in mind, let us inspect these roads after they have been completed and subjected to traffic for various periods of time.

First Road Examined.

In the case of the first road, the time will be four months. We find a small portion of it in excellent condition, a part of the remaining portion in scaling, badly, and the balance of the pavement is both wavy and scaly. Remember that this is only four months from the day this pavement was laid. This is no theoretical case. Quite recently I was over this particular pavement. Now, what really happened was this: An examination of the pavement from the different portions of the street showed very clearly that the portions of the pavement which were in fairly good condition carried about the normal percentage of bituminous material. The portions of the pavement that were scaling, instead of carrying between 10.5% and 11.5% bitumen carried on the average only 8.5%. The portion which was "shoving" had about 9% of bitumen. The analyses made by the engineer of this pavement all showed a bitumen content running between 10% and 11%, and, as you will recall, these samples were taken by the engineer on his daily visits to the street. It developed on further investigation that owing to the pressure of other work, the engineer regularly paid a visit to the street between 10 and 11 o'clock every morning. Therefore, the men at the plant and the men on the street, after that visit, knew there would be no further visits made that day and no other samples would be taken for analysis. It was very easy, therefore, for them to run during the early portion of the day, a mixture which contained the normal percentage of bitumen regardless of what they did afterward. It was also the case in this particular pavement that the contractor to whom the job was awarded was a man who had had a good deal of experience in public work, a man who stood very well with the administration, but this was his first attempt to lay a bituminous pavement. He was brought up in a school where anything to increase the output of the work could very often be gotten away with and such methods often did not seriously damage the final result, and being ignorant, he had to rely on the advice of the men he had hired for the job on the street and at the plant. They tried to make a low cost record for themselves by saving asphalt when they thought it would not be detected and by speeding up the plant.

Causes of Failure.

The deficiency in bitumen was one of the causes for the failure. Another cause was the fact that the pavement was insufficiently compressed, the rolling was done superficially, and the finished pavement had a density of between 1.85 and 1.89, which is much too low. An examination of certain portions of the pavement which were defective showed that not only was the bitumen content low but the grains of sand were insufficiently coated. That led to an investigation of the record as to the daily output of the plant. The plant had an ordinary 9 cubic yard mixer which turned out a batch of 1000 pounds of material. The specifications, backed up by the requirements of good practice, called for at least one minute's mixing in the mixer, the revolutions of the shafts between 60 and 80

per minute. An experienced mixing crew, trained to the last minute and entirely competent, can probably turn out one batch of mixture every minute and 20 seconds and give a full minute's mixing to each batch. An exceptionally well trained crew can, throughout the day, average one batch in 1 min. 30 sec. Giving the contractor the benefit of the doubt and assuming his crew to be an exceptional one, that would make 40 batches an hour. A thousand pound batch will lay 5 sq. yds. of 2-in. pavement, so the maximum output which could be allowed to a contractor doing his work properly and giving it the required time of mixing, would be 200 sq. yds. per hour.

In this particular case the work was prosecuted with a 9 hour plant day. That gives us 1800 sq. yds. per day as the maximum output for that plant. We found on investigating the records that 2500 or 2800, and even as high as 3000 sq. yd. had been laid per diem, which meant that the mixing was cut fully in half. That accounted for the insufficient coating of the sand grains. That, combined with the lack of rolling and the low percentage of bitumen, accounted entirely and wholly for the failure of that pavement in 4 months. The traffic on that road was heavy. The foundation was of concrete 8-in. thick and the subsoil was properly drained. There was no question of improper foundation or improper drainage. Further investigations involving a pretty close approximation of the daily amounts laid and their relative service records after the 4 months showed, in those cases where it was possible to trace them, which was about 30% of the time, that the pavement laid in the period from early morning up to 11 o'clock has given very good satisfaction. That illustrates as plainly as words can tell, what took place after the engineer had paid his daily visit and the contractor felt himself freed from further supervision for the balance of the day. An inspector at the plant would have verified the weights of the mixture. He would have verified the time allotted to mixing. He would not have permitted them to reduce it and the mixture sent to the street would have been of uniform bitumen content and his temperatures would have been properly maintained. The cost of that inspector at the plant weighed against the indirect cost to the city through the inconvenience to the public while taking up and replacing that pavement, and the cost of a new pavement which will fall directly on the contractor would have paid for ten inspectors at the plant ten times over.

Second Road Visited.

Now let us visit the second road. In this road two sands were used, one a coarse sand, and one a fine sand. In the fine sand the particles were almost wholly composed of quartz. They were very sharp and had rough surfaces to which bitumen adhered well. The coarse sand was partly rounded, and if used by itself would not have made a stable mixture. It was, however, the only coarse sand available in that location at anything like a reasonable cost and not more than 33% of it was required in the mixture. A mixture made according to these proportions would have had sufficient stability and was in all respects an excellent mixture. In this case you will remember daily samples were taken by the engineer on the street and the analysis that was made involved only the bitumen contents. The contractor was a man who had had very considerable experience in the laying of sheet asphalt, a man of high business honor and integrity and he tried honestly to lay the best pavement he knew how. The plant foreman was very good in some respects but slack in one particular. That one particular was fatal. Two years after that street was laid, possibly one-half of the pavement was in good condition and the balance was waving badly. The cause for the defective portions of the pavement was clearly traced to lack of care in the mixing of the sands. The established proportion for the sands was two of fine to one of coarse. Now, if you have had experience with asphalt plants, especially at the start of a piece of work, you will realize how very difficult it is to get men to keep their coarse sand piles separate from the fine sand piles

and establish a system whereby the sands will be mixed in the right proportion.

In this particular case the coarse sand was very much cheaper than the fine. The plant foreman, thinking to do his employer a good turn and reduce the cost to him of the pavement he was laying, tried to use all of the coarse sand possible. That policy was carried so far that possibly one-half of this pavement was laid with all coarse sand and no fine sand in it. The analyses showed that the bitumen content of that pavement ran uniform. The men on the mixer did their duty, using the same amount of sand and the same amount of filler and they kept the mixture uniform in these respects and the engineer congratulated himself that this pavement was more uniform than the average and he expected the best results from it. When we have a pavement with a given bitumen content composed of a large aggregate we have one in which the surface is more thickly covered with bitumen than in a pavement of the same bitumen content which is composed of a fine aggregate. In this particular case, when using the coarse sand alone, the mixture containing 10.5% bitumen probably carried over 1% excess of bitumen, which was further aggravated by the fact that the rounded grains had a comparatively smooth surface. The result was a pavement which markedly lacked stability and under heavy traffic it became wavy and shoved badly. In this case, the entire failure was due to not properly mixing the sands. An inspector at the plant who was competent and faithful would have kept an eye continually upon the men who were feeding the sand to the drum and would have seen that the coarse and fine sands were mixed in the proper proportion. Had he done so, that failure would not have occurred.

Third Road Inspected.

In the case of the third highway, which again was a main trunk line route, it also had a 6-in. concrete foundation and a subgrade more than ordinarily well drained, and only one sand was used. An inspector was present at the plant who was in every way competent. The analyses were complete and showed a mixture with a variation that was well within the average limits of departure from the standards set by the specification. In other words, the mixture was better than the average. The portions of the road that were laid in the early part of the season, showed at the end of two years a very decidedly wavy condition. Portions of the road which were laid toward the latter part of the season were as perfect at the end of two years, if not better than the day on which they were laid. Here was a case where the mixture was not at fault but what happened was this: In the early season the contractor had difficulty in getting a competent gang for the street. He had a poor roller man. He also had a four mile haul from the plant and the men who shovelled the material after it was dumped from the wagon were untrained and rakers and shovellers trampled upon the mixture while it was being spread. Complaint was made to the engineer having charge of the work of that very condition, but it appeared to be somewhat of a hardship to the contractor to expect him at the very start of the season to have a gang that was well trained and would fall into their places as they should. So, for a period of thirty days, workmanship on the street was tolerated which was not in accordance with the best practice but which would, possibly in 50 out of 100 cases, have resulted in an entirely satisfactory pavement. As is always the case, those portions of the street where the mixture had not been properly raked and fluffed up, contained places where the density of the pavement was greater than those parts immediately adjacent thereto, and when the roller passed over them there was left a pavement which did not have the same density throughout. The compression exerted by a heavy truck is greatly in excess of that which can be obtained with a steam roller and the concentrated traffic on that particular road found these spots that were less dense than others and began to depress them, and under modern motor traffic a depression once started quickly grows and gives

rise to other depressions until a series of waves is formed, with disastrous results which are familiar to us all.

The three roads in question were paved with sheet asphalt with 1½ in. of binder course and 1½ in. of surface mixture. In a normal sheet asphalt mixture, a total variation of 1½ % from the standard bitumen content desired is not necessarily fatal to the road or even extremely detrimental so that with this type of pavement a certain amount of inaccuracy in weighing the ingredients can be tolerated without specially bad results but in a great many sections of this country they lay what has been called Topeka mix, which is more or less of a hybrid. It was originally a sheet asphalt mixture containing a small percentage of stone, small enough in quantity and size to avoid the Warren Brothers' patents. The Warren Brothers had really covered the best possible grading for a coarse mineral aggregate in a bituminous pavement. There was great objection to laying a patented pavement and in order to get around that, they tried to lay this pavement which had only a small amount of stone in it. A great deal of this kind of pavement had been laid. Some of it has given very good results. In some cases its use has been justified by the fact that stone is cheaper than sand and the more stone the cheaper the aggregate will be and the less will be the amount of bitumen required, and, therefore, a considerable reduction in the cost of the pavement will be effected. The limit of variation in bitumen contents permissible in a Topeka mixture is, however, very much smaller than that which is permissible in a sheet asphalt mixture; therefore, more careful watching is required on the part of the platform mixing gang and greater accuracy in the weighing of the asphalt and the other ingredients of the batch.

When you think of men in a cloud of dust that at times is almost unbearably, turning out 40 batches an hour all day long, one wonders that they do as good as they do and it also becomes a matter of wonder how an engineer, having in charge a pavement involving 40 batches an hour separately weighed, could possibly go on without an adequate plant inspector and yet feel that the safety of the project was reasonably assured.

Temperature Tests.

There is another point which I would like to discuss, which was not involved in the case of these three roads mentioned, in order to illustrate another vital reason why an inspector should always be present at the bituminous mixing plant, and that is, the question of temperature. A test of the temperature of the mixture as it leaves the plant or as it reaches the street is not sufficient. In making the mixture we have two elements which are heated, the mineral aggregate and the asphalt cement. If we overheat the mineral aggregate and have a cool asphalt cement we have in the finished product a mixture which will come within the requirements of temperature but we will have injured the mixture because the mineral particles carry only a very thin film of bitumen and if heated beyond the danger point this thin film of bitumen will harden very rapidly. If, on the other hand, the sand or stone has been saturated with moisture by heavy rains the capacity of the drum for drying and heating the mineral aggregate will be reduced. Under such conditions, a foreman anxious to turn out a large output is tempted to overheat his asphalt to offset the low temperature of his heated aggregate, thus increasing the amount of mixture of normal temperature delivered by the plant. Such a mixture will be defective owing to undue hardening of the asphalt in the kettles and the bond between the bitumen and the sand will probably be weak.

In many cases, sand, which forms 75 % or more of a sheet asphalt pavement, is obtained from large pits that are operated by experienced men and they deliver a uniform supply which requires very little inspection to insure the use of suitable sand in the mixture. In other cases, the contractor frequently opens up his own sand pit. Often times stripping is required and the face of the sand pit is

found stratified, fine and coarse. Sometimes it is necessary to discard a layer 2 or possibly 3-ft. deep at the top in order to get a proper grading for the mineral aggregate. The contractor hires teamsters and places a man at the pit with a scraper and he instructs these teamsters to go to a certain portion of the pit and take the sand from there. The local teamster knows that the more loads he gets the better he will be paid and he takes the sand from the easiest or nearest part of the pit and the consequences are that half the loads should have been rejected. In other cases, where coarse and fine sand is mixed, it is very difficult to get the contractor to keep the sands separate. The drivers are careless and dump fine sand on the coarse pile and vice versa and there is no possible way of separating and grading the sands properly and the consequence is that the mineral aggregate varies so much that it does not come within the limit of the specifications or good practice, and, even if it does happen to fall within those limits, the variation is still so great that in order to secure the best results, the bitumen content should be varied. This it is impossible to do satisfactorily.

The asphalt cement in former days used to be made at the plant by fluxing a hard asphalt with flux but today most of the large asphalt manufacturers send tank cars that are tested, either before they leave the plant or on delivery, and the variations in penetration are very trifling and do not require to be tested more than once per tank car delivery instead of once for every kettle filled at the plant unless the contents of the kettles are kept under heat for a very long time.

BRITISH FIRM CELEBRATES CENTENARY.

THOMAS Piggott & Co. Ltd., Birmingham, England, who recently celebrated their centenary, are one of the leading concerns in England engaged in the manufacture of steel pipe and tanks. The company was first organized to build iron canal-barges but developed other fields of activity until 1880, when manufacture of steep pipe and tanks was undertaken; being one of the pioneers in that particular line. Thomas Piggott & Co. do not confine their efforts to the home market, but have developed an extensive foreign connection and have completed several important contracts in various parts of the world. One of the first contracts they secured was in Kimberley, South Africa, where they laid down some ten miles of 14 in. and 18 in. water mains. For Sydney, Australia, this company supplied steel pipe up to 8 ft. diameter for water mains, for crossing a number of wide creeks and these were erected and worked in spans of 50 ft. without any trussing. Thomas Piggott & Co. designed and erected the first canal for the irrigation works in Egypt. The canal consisted of a semi-circular steel culvert 19 ft. 8¼ in. diameter by 5,185 ft. long. Later they supplied a riveted steel main 6 ft. 6¼ in. diameter by 3,100 ft. long.

TOWN PLANNING COMMITTEE FORMED.

PREMIER Drury announced in the Legislature last Thursday the personnel of a committee on town planning, which will meet during the recess and report at the next session. The members announced were: Hon. Walter Rollo, West Hamilton; Hon. G. S. Henry, East York; C. S. Swayze, Niagara Falls; J. B. Cunningham, Sault Ste. Marie; Edgar Watson, North Victoria; A. G. Tisdelle, North Essex; Joseph Thompson, Northeast Toronto; Jack Ramsden, Southwest Toronto; J. A. Pinard, East Ottawa, and G. G. Halcrow, of East Hamilton.

The Engineering Equipment Co. Ltd., Montreal, have recently been appointed as exclusive Canadian sales representatives for Schutte & Koerting Co., of Philadelphia, manufacturers of low level jet condensers and other power plant equipment.

INDEFINITENESS IN SPECIFICATIONS.

INCALCULABLE annoyance and friction in the smooth relationship of engineer and contractor arises through the lack of definiteness in specifications. If, as frequently happens, those things which the contractor is supposed to do in return for his compensation, are left unspecified or left to the discretion of the engineer, there is bound to be, sooner or later, a dispute of more or less serious character. Apart from the normal difference of opinion that may exist between the two parties to the contract there is the temptation for one or other party to exact more than was intended in the contract if the character of the work be not positively specified.

Two causes, perhaps, lie behind the lack of definiteness in specifications. There is first the occasional lack of knowledge of the engineer concerning the work or detail being described. Under such circumstances he is disposed to require that the work be to the satisfaction of the engineer, or as the engineer may direct, or merely proper and sufficient. Anyone of these is entirely unsatisfactory, to say the least, and it is difficult to see how the work could be carried out without dispute under the specification containing stipulations of this kind.

Another cause of indefiniteness is carelessness and habitual lack of precision. The engineer may be experienced and may have a proper conception of what might reasonably be required, but through the habit of copying old and faulty specifications, or through mental indolence neglects to state exactly in quantitative or qualitative terms the characteristics of the work that is to be finished. For example, in a recent specification for concrete it is stated

that the maximum size of "one-man stone" shall not exceed that which one man can lift and readily move about. Here is an opportunity for dispute which is properly guarded against in another specification where the maximum size of such stones is fixed at 100 lb. weight. Other specifications have been known to require that concrete be not dropped from a height, without definition of the latter term; that stones for the aggregate be as nearly cubical as possible; that timber be free from knots, regardless of the expense involved in furnishing such timber; that sewer pipe be free from cracks and blisters, a condition that would be realized in only a very small percentage of pipes produced; that a wall be given a mortar coating, without specification of either composition or thickness; or that the surface of a concrete pier or abutment be finished in a manner to be specified later by the engineer.

Whatever the causes of such lack of precision in specifications may be, there can be no difference of opinion as to the undesirable results attending it. Engineers should exert every effort to insure that whatever is specified is described in a definite numerical or qualitative way.

CREATION OF URBAN AREAS.

NO achievement of the engineer impresses the public more than additions to the area of the earth's surface. In such work creative engineering is seen at its best. Even the most unobservant are disposed to view with admiration the work of one who adds valuable acres to an already congested city area.

Of such work there are numerous examples both in this country and abroad. The admirable achievement of the Toronto Harbor Commission in adding a large industrial area to the city through the reclamation of Ashbridge's Bay is familiar to most people in Canada. Similar developments, of less spectacular character, are under way in other parts of Canada.

Perhaps the most amazing reclamation project planned to create additional urban acreage is that proposed for the extension of Manhattan Island by Dr. T. Kennard Thomson, a Canadian-born engineer, who has for many years been resident in New York. To relieve the extreme congestion of lower Manhattan and to maintain the present centre of the down-town business district, it is proposed to extend Manhattan some six miles down the bay by the process of filling in the shallow waters to the south of the Battery. By so doing 3,840 acres of land would be created, 12 lineal miles of new wharves would be possible, and by means of tunnels, Staten Island would become accessible to the Manhattan extension as Brooklyn now is to Manhattan proper. Revolutionary methods of transit would be adopted as a feature of the plan, the streets having four levels, the bottom one being for sewers, pipes and wires only, the second for heavy trucking and belt line railroads, the third for rapid transit and the fourth for light motor traffic. Arrangements would be made for freight and express cars to unload directly on motor trucks which would give the much desired store delivery.

So extensive is the project that some people are disposed to say that it is not in the realm of the immediately practicable. Granted that the work were carried out, it is very probable that the addition of six square miles of new territory to Manhattan Island with tremendous accruing advantages would ultimately justify the expenditure. It is calculated that the addition to the city's assets in the way of taxable land, buildings, docks, and the like, would be some \$5,000,000,000. Those who are supporting Dr. Thomson in the project express the view that the commercial advantage to the city would be sufficiently great to warrant great efforts being put forward to carry it to realization.

While no such astounding development presses upon the attention of Canadian cities, the extent to which engineers and business men are disposed to go to relieve undesirable building and traffic situations in the larger cities

of this continent affords a suggestion for us when disturbing conditions of area and transportation arise. Under such circumstances a bold and almost visionary policy appears to be the soundest.

PERSONALS

HOWARD W. TYE for nearly twenty years construction engineer for the Canadian Pacific Railway has been appointed superintendent of the Alberta Provincial Railway, the Lacombe and Northwestern.

N. H. BRADLEY has been appointed as District Surveyor and Engineer for the Peace River District, Department of Public Works of Canada. Mr. Bradley was formerly assistant engineer at Lethbridge, Alta. His new headquarters are at Edmonton.

JAMES EWING, E. S. M. LOVELACE and ALTHEOD TREMBLAY, who have been in partnership for several years in Montreal under the firm name of Ewing, Lovelace & Tremblay, civil engineers and land surveyors, have dissolved partnership. Messrs. Lovelace and Tremblay have formed a new partnership under the title of Lovelace and Tremblay, while Messrs. Ewing and Tremblay have formed a separate partnership under the name of Ewing & Tremblay. Both new firms are occupying offices at 14 Phillips Square, Montreal. Mr. Tremblay, who is a member of the Board of Quebec Land Surveyors, is a professor at Laval University. Mr. Lovelace is a graduate of McGill University (gold medalist), class of 1888, and has had long experience as a surveyor and municipal engineer in the province of Quebec. Mr. Ewing is vice-president of the Town Planning Institute of Canada, and has had extensive experience in railway, civil engineering and town planning work, and has been the consultant on several town planning enterprises in the last few years. He is an expert draftsman, having been formerly chief draftsman of the Canadian Pacific Railway Co., and has been responsible for the preparation of a number of Canada's most valuable maps now in use in railway and other work.

LT.-COL. HAROLD L. TROTTER, who recently entered private practice as a consulting engineer, opening an office in the New Birks Building, Montreal, was born in that city in January, 1883, and was educated at the St.

Johns High School, St. Johns, Que., the Abingdon School, Montreal, and the Royal Military College, Kingston, where he graduated in June, 1903. For the following eight years he was employed by Ross & Holgate, consulting engineers, Montreal, and while with that firm he was engaged on a great variety of work, chiefly hydro-electric and reinforced concrete, both in the field and in the office. In 1911 when the firm of Ross & Holgate, was dissolved Col. Trotter remained with Mr. Holgate and was with him as an associate until March 1915, when he joined

and served in that capacity until the end of the war, being promoted to the rank of Lieutenant-Colonel in command of the 11th Battalion, Canadian Engineers, in May, 1918, when the engineer units were reorganized. Lt.-Col. Trotter was mentioned in dispatches on three occasions, and he received the D.S.O. He returned to Canada in June, 1919, and after three months on a road contract at Revelstoke, B.C., he became chief engineer for Morrow & Beatty, general contractors, Peterboro, Ont., on the construction of a new power plant for the Abitibi Power & Paper Co. at Twin Falls on the Abitibi River. Upon the conclusion of this work Col. Trotter decided to enter private practice, and opened his present office in March of this year. Lt.-Col. Trotter has been an associate member of the Engineering Institute of Canada since 1907, and was recently transferred to the rank of member.

MORE SPEAKERS AT GOOD ROADS CONVENTION

SEVERAL additional speakers have notified the executive of the Canadian Good Roads Association that they will participate in the ninth annual convention to be held in Victoria, B.C., from June 12 to 15, and it is evident that while there will be some entertainment during these four days for the delegates, they will have full occupation for their time in the sessions of the convention, and the principal tours, etc., that have been organized by the reception committee will have to be carried out on the Friday and Saturday after the close of the business proceedings, so that delegates may count on a full week in Victoria, and as much longer as they desire to stay on the mainland. The Good Roads convention is essentially a business gathering, and the executive are allowing nothing to interfere with the program as drawn up. They have extended the meetings from three days to four, feeling that with delegates coming from such long distances the fullest opportunity must be taken of diffusing knowledge on highway matters to them, and a program of speakers without parallel has been arranged for this purpose.

Premier Bell, of Prince Edward Island, has notified the President, the Hon. Sam J. Latta, that he will head the delegation from the eastern extremity of the Dominion, while R. H. Murray, president of the Nova Scotia Good Roads Association will head the group of road enthusiasts from Nova Scotia. From New Brunswick, R. Downing Patterson, of the Good Roads Association in that province will bring several delegates, while Premier Taschereau has informed the Hon. Mr. Latta that while it will be impossible for him to make the journey, the Hon. J. L. Perron, Minister of Highways, and several of the Quebec Government officials will do so. The Ontario Government will also be represented, as well as many of the good roads and automobile organizations of that province. The city of Ottawa is sending one of its controllers as well as A. MacCallum, Commissioner of Works. The subject of the address by A. W. Campbell, Federal Commissioner of Highways, will be "Federal Aid, its implications and results," while Professor Greig, of the University of Saskatchewan will give the address on drainage methods for prairie roads, with H. R. Mackenzie, chief field engineer of the Province of Saskatchewan will open the discussion on this subject. C. A. Mullin of Montreal will speak on asphaltic concrete pavements, while Russell T. Kelley, of Hamilton, vice-president of the Canadian Good Roads Association, and G. Webster, of Calgary, Alta., will lead the discussion on "Tourist Traffic." It is almost certain that A. P. Sandies, of Columbus, Ohio, one of the outstanding figures at previous conventions will be present and give a practical address on highway matters.

The Toronto party of delegates to the Canadian Good Roads Association Convention at Victoria will leave Toronto on the Trans-Canada C.P.R. train at 9 p.m. standard time, June 6. The dates of the convention are June 12 to 15.

the Canadian Engineers. For the remainder of that year he was employed under the C.R.C.E. at Quebec, and in March, 1916, he went overseas. He went to France with the 4th Canadian Division in August, 1916, as major in command of the 11th Field Company, Canadian Engineers,

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand or proposed, contracts awarded, changes in staffs, etc.

TENDERS PENDING

The following tabulation is presented as a reminder to contractors in regard to tenders that are still pending, other than those reported in this issue. The word "Issue" refers to the issue of "Canadian Engineer" in which there appeared a notice giving details regarding the call for tenders.

Place of Work	Tenders Close	Issue
Toronto, Ont., installation of one four-million Imperial gallon centrifugal pump at Island Pumping Station....	June 13	May 9
Nassau, New Providence, Bahamas, dredging	July 15	May 9
Revelstoke, B.C., construction of bridge	Jun. 19	May 23
Westminster Junction, B.C., construction of steel highway bridge	Jun. 10	May 23
St. Catharines, Ont., Sections 3 and 4 combined, Welland Ship Canal ..	Jun. 9	May 23
Birch Cliff, Ont., construction of concrete sidewalks	Jun. 12	May 30
Revelstoke, B.C., substructure of bridge	Jun. 19	May 30
Saskatchewan, Province of, construction of earth road from Canora south to Burgis	Jun. 8	May 30
Saskatchewan, Province of, construction of earth road from Kamsack north six miles	Jun. 8	May 30

ROADS, BRIDGES AND STREETS

Alberta, Province of.—A survey is being made of a section of the Jasper Highway between Evansburg and Lobstick junction, a distance of seven miles. It is understood that the completion of the road up to this point will be proceeded with on the government's road building program this summer.

British Columbia, Province of.—Approximately \$1,500,000 will be spent on highways this year, Hon. W. H. Sutherland, Minister of Public Works, announced. The work includes the Pacific Highway paving in the municipality of Surrey; the Nelson-Ymir Road, \$80,000; Cascade-Rossland Road, \$230,000; roads in Similkameen district, \$80,000, Columbia Valley work, \$62,000; Yellow Head Pass project, \$68,000, etc.

Coquitlam, B.C.—The C.P.R. bridge over the Coquitlam river, which was washed away last year by floods, is now being replaced by a modern structure at a cost of \$172,000.

Galt, Ont.—A 12-in. drain will be built on the Roseville Road, Waterloo County, for a distance of 400 ft., and other improvements made to the road. Improvements will also be made on Blair Road. Road Supt., L. S. Lichty, Wellesley, Ont.

Guelph, Ont.—McNamara Bros. & Thornton have been awarded contract for construction of pavement from end of pavement on Elora Road out towards Marden.

Kamloops, B. C.—Local Board of Trade is trying to secure action by the Provincial Government in respect of the extension of the North Thompson Road to Tete Jaune Cache and through to the inter-provincial boundary.

Milton, Ont.—By-law providing for extension of concrete walks was carried by ratepayers. Clerk, G. A. Hemstreet, Milton West.

New Brunswick, Province of.—Hon. P. J. Veniot, Minister of Public Works, awarded contract for construction of the Copp concrete arch culvert and roadway embankment in Parish of Sackville to John W. McManus Co., Ltd., at approximately \$8,000, and contract for Little River Mouth bridge, Parish of Bathurst, was awarded to Whitman Brewer, of North Devon, at approximately \$13,000.

Newmarket, Ont.—Contract let to Warren Bituminous Paving Co. of Ontario, Ltd., Toronto, for paving of certain streets, approximately 12,000 sq. yds.

Newmarket, Ont.—Town Council decided to spend \$70,000 on pavements for Prospect St., Church St., Park Ave. and Timothy St. Clerk, P. J. Anderson.

Ottawa, Ont.—Railway committee of House of Commons passed the bill to permit the Niagara River Bridge Co. to enlarge, alter or remove its present bridge across the Niagara River and among other things to permit increase of its capital stock from one million to two million dollars.

Ottawa, Ont.—Following contracts were awarded by Carleton County Council: Steel work, Porteous bridge, \$3,446, and steel work, North Gower bridge, \$1,344, to Ontario Bridge Co.; about three miles of bituminous penetration work on Richmond Road, McDonnell, Dibblee & Co.; work on Cyrville Road (about 1 mile) work on Base Line Road (about ½ mile), Ormond & Brule; Carp Village and Osgoode Station Roads, W. J. Farmer. Patterson & Byrne, County Engineers, were instructed to call for tenders for superstructure of Porteous and North Gower bridges.

Palmerston, Ont.—Contract for construction of pavement awarded to W. C. Brennan & Co.

Pikington, Ont.—Contract for construction of a 36-ft. bridge and abutment for steel bridge awarded to McNabb & Callaghan, of Arthur, Ont.

Quebec, Province of.—Tenders will be called by Highway Dept. for Quebec-Ste. Anne Highway. Minister, Hon. J. L. Perron.

St. Catharines, Ont.—City Council awarded following contracts: To A. Longley, of St. Catharines, 9,600 lin. ft. of concrete sidewalks; Newman Bros. and A. Longley, St. Catharines, 6,000 sq. yds. concrete pavement; Newman Bros. and A. Longley, 10,000 sq. yds. concrete foundation with curbs and gutter.

St. Thomas, Ont.—The question of seeking the co-operation of the London City Council and other influential bodies of that city in petitioning the Provincial Department of Highways to adopt the London and Port Stanley Gravel Road into the Provincial Highway System and proceed with

paving operations, is under discussion in this city and it is probable that action will be taken in the near future.

Sarnia, Ont.—Road improvements are planned on several roads in Lambton County, including the roads running through the Beehive corner, Kimball and Wilkesport. Road Supt., John McCallum, Alvinston.

Saskatchewan, Province of.—Tenders will be received until 4 o'clock, Monday, June 19, for concrete bridges. (See official adv.).

Thamesville, Ont.—Provincial Highway Dept. plans to take over the Longwoods Road in this village.

Thamesville, Ont.—Contract awarded to Merlo, Merlo & Ray, of Walkerville, for construction of pavement on Base Line, at \$2.63 per sq. yd.

Toronto, Ont.—Several streets in Victoria Park will be graded.

Toronto, Ont.—City Council intends to construct concrete curbs on Runnymede Road and Walpole Ave., at a cost of \$3,124; also asphalt pavement on Runnymede Road, at cost of \$49,004.

Toronto, Ont.—City Council took first step towards the widening of Bloor St., from Sherbourne to Spadina Ave., by ordering the filing of a plan of the work in the Registry Office. Estimated cost, \$1,500,000.

Vancouver, B.C.—City Council approved an expenditure of \$195,000 on street improvements, work to be done by day labor. City Engineer, F. C. Fellowes.

Whittemouth, Man.—Rural municipality of Whittemouth proposes to pass a by-law for the opening and construction of a roadway. Sec.-Treas., Charles Pound.

WATER, SEWAGE AND REFUSE

Edmonton, Alta.—Tenders were received by the City Commissioners until June 5 for approximately 12,300 lin. ft. of sewers in Highlands subdivision, and for approximately 16,000 lin. ft. of watermain in Bellevue and Bellevue addition. Commissioner, C. J. Yorath.

Galt, Ont.—City Council intends to construct a sanitary sewer on Blair Road and Samuelson St., at an estimated cost of \$11,528.11. City Clerk, Joseph McCartney.

Galt, Ont.—City Council intends to construct a sanitary sewer on Chalmers St., from Dundas St. to McNaughton St., at an estimated cost of \$3,343.74.

Guelph, Ont.—Provincial Board of Health has approved of proposed sewerage work to be done by the city on Waterloo Ave. City Engineer, F. McArthur. Estimated cost, \$43,195.

Hamilton, Ont.—Contract for construction of pipe sewers in King William, Stirton, Dalhousie and Gore Streets and Campbell Ave. awarded to John Maguire Contracting Co., Ltd., Toronto, at \$187,433.80. W. R. Worthington, Toronto, also submitted a tender at \$249,298.93.

Milton, Ont.—By-law providing for water mains was passed by ratepayers. Clerk, G. A. Hemstreet, Milton West.

Montreal, Que.—City Council decided to spend \$6,000 for water meters for Cote de Neiges district.

Montreal, Que.—Contract for sewer on St. Urbain St., costing \$11,154, was awarded by City Council to C. Frascarelli & Co.

North Grimsby Tp., Ont.—Tenders, addressed to Thos. Allen, Township Clerk, Grimsby, Ont., will be received until 6 o'clock p.m., Saturday, June 10, for the following material and work: (1) Supply of 20,000 ft. of 6-in. class C, C. I. pipe and specials; (2) valves, valve boxes and hydrants; and (3) trenching, laying and backfilling. Engineer, F. N. Rutherford, 24 Queen St., St. Catharines, Ont.

Quebec, Que.—J. A. Tremblay, chief engineer of the Waterworks Department, is now ready to call for tenders for the trenching and refilling that will be involved in connection with the extension of the water and drainage system of the city for the sections recommended for these improvements by the City Council. These include Belvedere, Marquette, Champlain and the Q.A.A. grounds.

St. Catharines, Ont.—City Council awarded contracts for sewers to Peter Mohan, of London; Mitchell Contracting Co., of London; and Sacco & Lorenzo, Niagara Falls, Ont.

Thorold, Ont.—Tenders, addressed to B. R. Noble, Secretary, Public Utilities Commission, will be received until 6 o'clock p.m., June 15, for the following material and work: (1) Supply of 4 and 6-in. class B, cast iron water-pipe and specials; (2) 4-in. and 6-in. valves and valve boxes; (3) hydrants; (4) 9.640 ft. of trenching. Information may be obtained from Engineer, F. N. Rutherford, 24 Queen St., St. Catharines.

Toronto, Ont.—Contract for construction of sewer in Margueretta St. awarded to Commissioner R. C. Harris at \$43,900.

Toronto, Ont.—Contract for laying and jointing of 6-in. water pipes in Durie St. and Firstbrook Road awarded to W. E. Taylor.

Toronto, Ont.—City Council ordered the construction of a sewer on Mount Pleasant Road, between Heath St. and St. Clair Ave.

Toronto, Ont.—Contracts for construction of sewers—Western Harbor Development Drainage System—awarded as follows: Section 1, 2,000 ft. east of Parkside Drive to 1,475 ft. farther east, Commissioner R. C. Harris, \$24,532; Section 2, Parkside Drive to Windermere Ave., W. R. Worthington, \$114,443; Section 3, Windermere Ave. to Jane St., W. R. Worthington, \$5,869.

Welland, Ont.—City Engineer Chas. L. Coulson has prepared plans for sewers in Queen St. West and Margaret St., and City Clerk Forster will advertise for tenders at once. Petitions for similar construction in Bald St., west of the N. S. & T., and Major St., east of Myrtle Ave., are in the hands of the City Engineer.

Windsor, Ont.—City Council let contract for laying a short stretch of sewer on Huron St. to Pettypiece's, Ltd., of Amherstburg, Ont.

LIGHT, HEAT AND POWER

British Columbia, Province of.—Contracts for four 54-in. pumps which are to be installed at the Sumas dam, to drain Sumas Lake, have been awarded to the Dominion Engineering Works, Ltd., Montreal, by the B. C. Land Settlement Board. The pumps, which have a capacity of 750 second ft., are driven by individual motors, which will be of approximately 600 and 1,200 h.p., two of each being installed. The contract was let through C. A. Yowill, of Vancouver, and delivery is promised for February, 1923.

Durham, Ont.—At a recent meeting held here of the Hydro-Electric Power Commission of Ontario and the municipalities linked up with the Eugenia system, it was stated by Engineer Jeffery that in order to increase the power at Eugenia, three schemes were being considered by the commission: Linking up with Niagara, putting in a pipeline or developing the Saugeen River near Burgoyne, Ont.

New Liskeard, Ont.—Reference was made in this column in our issue of May 23 to commencement of work on 6,000 h.p. development at Indian Chutes on the Montreal River, twelve miles above the town of Elk Lake, for the Matachewan Power Co., Ltd., the engineers for which are Sutcliffe & Neelands, Ltd., of New Liskeard. Announcement has now been made of the board of directors of the company as follows: President, Robert Fennell, Toronto; 1st vice-president, F. J. Westaway, Hamilton; 2nd vice-president, Col. Robert Stark, Montreal; D. W. Caldwell, Perth; Sir Henry Galway, D.S.O., London, Eng.; and H. W. Sutcliffe, New Liskeard. The completed plant, which will produce 13,000 h.p., will supply power to the Kirkland Lake, Elk Lake, Gowanda and Shining Tree mining camps. The company, which is capitalized at \$1,000,000, has the power rights on the Indian Chutes and Big Ben, on Montreal River. Work has already commenced and orders for machinery will be placed at once.

Ontario, Province of.—Included in the supplementary Hydro estimates is an item of \$20,000 for preliminary engineering and reconnaissance work in connection with a

new trunk line from Queenston to St. Thomas. \$90,000 is included for the completion this year of the installation of four 50,000 k.v.a. transformers; Kent station, \$20,000; Guelph, \$40,000; Essex, \$140,000; Stratford, \$36,000; and Preston, \$36,000, all of these being for increased capacity.

Winnipeg, Man.—City Council let contract for supply of 3,000 k.v.a. transformers to the Canadian Westinghouse Co., of this city, at \$10,370.

RAILWAYS

Alberta, Province of.—Contract for preliminary construction work on 12-mile extension of the Lacombe Northwestern Railway has been awarded by the Provincial Department of Railways to W. A. Dutton. Estimated cost of completed road, \$250,000.

Alberta, Province of.—Tenders are being called for by the Railway Department on the construction of a 12-mile extension on the Lacombe Northwestern Railway. The engineering work will be under the supervision of Capt. Howard Tye. Minister of Railways, Hon. V. W. Smith.

Alberta, Province of.—Tenders are being called for several pieces of construction in Alberta by the Canadian National Railway. A connection between the Canadian Northern and the Grand Trunk Pacific at Magnolia, a distance of .83 miles; a connection between Bashaw and Battle River subdivisions, 3.47 miles long, near Camrose, and a connection at Ryley, 1.83 miles long, between the Viking and Battle River subdivisions are to be constructed. The plans and specifications may be seen at the office of the district engineer in Edmonton and the division engineer in Calgary.

Galt, Ont.—General Manager M. W. Kirkwood of the G.R.R. and L.E. & N. Ry., has received from Montreal the revised plans for the new depot to be erected on Main St.

Stratford, Ont.—Grand Trunk Railway plans to greatly enlarge their repair shops here at an approximate cost of \$1,000,000.

FACTORIES AND LARGE BUILDINGS

Alliance, Alta.—A \$100,000 fire destroyed an entire business block on the main street.

Bramford, Ont.—Tenders for plumbing required for the Alexandra and Victoria Schools will be received by A. K. Bunnell, Secretary, until Thursday, June 8. Specifications will be furnished by G. W. Broomfield, plumbing inspector, at office of City Engineer.

Bridgeburg, Ont.—St. Paul's Anglican congregation will construct a parish hall on corner of Emerick and Central Avenues. Rector, Rev. Canon D. R. Smith.

Brockville, Ont.—Contracts awarded to J. A. Grant & Co., Ltd., of Montreal, for construction of rod rolling mill and electrical sub-station for Eugene F. Phillips Electrical Works, Ltd.

Calgary, Alta.—School Board sold an issue of debentures amounting to \$280,000 for the erection of a Normal school and various small buildings.

Calgary, Alta.—The Baird Construction Co. who obtained the contract for the new service building at the General hospital, have started work.

Calgary, Alta.—Board of Trustees of Calgary School District No. 19 of the Province of Alberta proposes to apply to the Board of Public Utility Commissioners for authority to borrow \$140,000 for the purchase of the Pryce Jones property for \$105,000, and for repairs and alterations to same at a cost of \$35,000. Secretary, D. C. Bayne.

Chatham, Ont.—E. B. Lawler, district engineer of the Hydro-Electric Power Commission of Ontario, has completed plans for a transformer sub-station to be erected in South Kent near the village of Fletcher.

Dutton, Ont.—Tenders will be received by Barrach & Findlay, Architects, 130 Talbot St., St. Thomas, Ont., until Wednesday, June 7, for the erection of a Memorial Hall.

Ford, Ont.—Separate School Board awarded contract to Cleveland Mousseau for construction of three-roomed separate school on Janisse Ave., at \$5,000.

Hamilton, Ont.—Kanadda Biscuit Co. plans erection of plant. Architects, B. H. Prack and A. E. Prack.

Halifax, N.S.—The M. E. Keefe Construction Co. have been awarded contract for addition to Monastery of the Good Shepherd, Quinpool Road.

La Fleche, Sask.—Contract for erection of Roman Catholic church awarded to Sam Pritchard, of Moose Jaw, at \$35,000.

Leamington, Ont.—Erection of new Baptist Church building is projected.

Lindsay, Ont.—Board of Education accepted plans and specifications submitted by Sharpe & Horner, Architects, of Toronto, for proposed alteration and extension to Collegiate Institute. Architects were instructed to advertise for tenders.

London, Ont.—Plans of the new arts college building of Western University have been approved and tenders will be called for within a few days.

Mailardville, B.C.—Coquitlam School Board awarded following contracts for repairing municipal schools: Building new foundation at Millside School, Philip & Shaw, New Westminster; repairs to Blue Mountain School, Spring & Sibley, New Westminster; plumbing at Millside and Blue Mountain schools, James & McClughan, Ltd., New Westminster.

Milton, Ont.—By-law providing for improvements to Town Hall was passed by ratepayers. Clerk, G. A. Hemstreet, Milton West.

Newmarket, Ont.—Town Council considering erection of school at cost of \$54,000.

Ottawa, Ont.—Tenders were received until June 2 by the Ottawa Hydro-Electric Commission for structural steelwork for a substation to be erected. General Manager, J. E. Brown.

Port Arthur, Ont.—City Council passed by-law providing for raising of \$200,000 for erection of public school on Prospect Ave. City Clerk, T. F. Milne.

Port Arthur, Ont.—City Council passed by-law providing for raising of \$7,500 for construction of arena in Current River Park. City Clerk, T. F. Milne.

Preston, Ont.—George Mather was awarded contract for new ward school to be erected on Moore St., at \$36,798, including all trades except heating, plumbing and ventflating.

St. John, N.B.—Fire on the premises of the St. John Drydock & Shipbuilding Co. destroyed the roundhouse and one locomotive, a building owned by the Bedford Construction Co., a compression outfit owned by the Drydock company and stores, valued at \$20,000. Total loss, \$30,000.

St. Laurent, Que.—Contract for erection of schoolhouse has been awarded to G. Carta.

Saltfleet Tn., Ont.—Tenders were received until June 5 by R. H. Dewar, Secretary, School Board, Fruitland, Ont., for erection of addition to school building in S. S. No. 2, Saltfleet.

Sherbrooke, Que.—Tenders were received until June 5 by J. W. Gregoire, Architect, for the building of a school in the West Ward for the Catholic Board of School Commissioners.

Toronto, Ont.—Board of Education has purchased a school site in Leslie Gardens. It is expected that a school of six or eight rooms will be built this year.

Toronto, Ont.—Tenders, bulk or separate, will be received until noon, Thursday, June 8, for the erection of a Sunday School Building at the corner of Greenwood Ave. and Globeholme Boulevard. Architects, Wlekson, Gregg & Brydon, 1112 Temple Bldg.

Vancouver, B.C.—A plant is to be established here by the Canada Wire & Cable Co., of Toronto. General Manager, H. Horsman.

Welland, Ont.—Public Library Board has been notified of the appropriation by the Carnegie Foundation of \$25,000

The Canadian Engineer

A Weekly Paper for Civil Engineers and Contractors

Pumping and Filter Plant at Sturgeon Falls, Ont.

Supply Drawn From Sturgeon River by Two 6-in. 2-Stage Centrifugal Pumps—Three Horizontal Pressure Filters—New Pump and Filter House and Water Tower—Cost of Work, \$80,000.

RECENTLY there was put into service a much needed pumping and filter plant for the Town of Sturgeon Falls, Ont. This community, having a population of 4,000 now draws its water supply from an intake in the Sturgeon River. The quality of the water obtained is excellent and provision is made for a domestic pressure of 70 lb. per sq. in. and a pressure for fire service of 120 lb. per sq. in. by the new improvements. The pump and filter house, the water tower and the pumping and filter equipment are illustrated in Figs. 1 to 3.

Intake.

Water is drawn from the Sturgeon River by means of a rectangular reinforced concrete intake chamber 6 ft. by 11 ft. 6 in. and 9 ft. deep. The bottom of the intake is 18 in. below low water level and the top is just above high water level. This box, of which the exterior walls consist of 12 in. of reinforced concrete is divided into two compartments by an 8-in. vertical division wall. In this dividing wall there is an 18-in. sluice gate, making it possible to cut off the water from the compartment in which the intake pipe is located. The latter, which is of cast iron and 10 in. in diameter, is provided with a strainer at the lower end. In the opposite compartment an opening 2 ft. 6 in. by 3 ft. 6 in. is provided in the down stream outer wall for the admission of water. To protect the intake from debris, a vertical deflecting wall is constructed between the intake and the shore. The outer walls of the intake chamber are reinforced by $\frac{5}{8}$ -in. dia. horizontal round rods spaced 12 in. centre to centre vertically. The top of the

stage centrifugal pumps, direct connected with flexible coupling to 100-h.p. Westinghouse constant speed motors of the 3-phase, 60-cycle, 555-volt type having a speed of 1740 r.p.m. The pumps have a capacity of 1350 U.S. gal. per min. against a head of 180 ft. for domestic purposes and 1080 U. S. gal. against a head of 225 ft. for fire pur-

FIG. 2—PUMP AND FILTER HOUSE AND ELEVATED TANK

FIG. 1—PUMPING UNIT IN OPERATION

intake is covered by a 3-in. concrete slab and contains an 18-in. manhole for each compartment.

To provide the necessary supply of water for the town there have been installed in the pump house two 6-in., 2-

poses. They have bronze impellers and a brass covered shaft. One of them with its motor is shown clearly in Fig. 1. The location of these pumps in the pump and filter house is indicated in Fig. 3.

Filters.

After some study it was decided to instal for purification purposes three horizontal pressure filters 8 ft. in diameter and 10 ft. long giving a total filter area of 270 sq. ft. and a capacity of from 600 to 1200 gal. per min. The filter tank shells are designed for a working pressure of 100 lb. per sq. in. They each rest on two concrete cradles 12 in. wide and 7 ft. 6 in. long, as shown in Fig. 3. Each filter contains $2\frac{1}{2}$ ft. of sand overlying 14 in. of gravel. These materials were brought from the Atlantic Coast and are known as the Cape May variety. The collector pipe tapers from about 4 in. at the dead end to 6 in. at the delivery end. Branching off from this in both directions horizontally are $1\frac{1}{2}$ -in. cast iron laterals spaced $10\frac{1}{2}$ in. centre to centre. Brass strainers connect to the laterals at distances of 7 in. apart. The collector pipes and laterals rest on a bed of grout carried up to the level of the top of the laterals.

Raw water is supplied to the three filters through an 8-in. flanged cast iron pipe provided with Chapman gate

valves. The filter water is drawn off through a 8-in. cast iron pipe similarly equipped. The filter contractor supplied all interconnecting piping for the three units above the floor line and on each wash discharge a cast iron funnel to be set in the floor, making connection with a 10-in. Akron tile line furnished and laid by the town.

Pump and Filter House.

To house the pumping and filter equipment, the building shown in Fig. 2 was constructed. This consists of a two-storey brick building 22 ft. by 40 ft. with a one storey attached portion 22 ft. by 29 ft. 6 in. The chief operator lives over the pump house and his assistants work on eight-hour shifts making a very easy and satisfactory arrangement for the operation of the station.

Alum Supply.

A small coagulant feed for the alum is connected to the main between the pumps and the filters. As yet the town has not resorted to chlorination, as the water is clear and pure enough not to require this treatment.

Power.

The town is now fortunately situated with respect to electric power for pumping as well as lighting service. Recently it purchased the entire electric light system from the Northern Ontario Light and Power Co. and is now operating the system. Power is bought from the Spanish River Pulp and Paper Co.

For reservoir purposes the elevated water tank shown in Fig. 2 was constructed and is in service. The tank is 28 ft. in diameter with hemispherical bottom and has a capacity of 128,500 Imp. gal. It is 155 ft. high to the top of the tank sides and rests on 4 posts, which have a maximum section consisting of two channels 15 in. at 40 lb., and one plate 17 by $\frac{3}{4}$ in. Horizontal struts consist of two latticed channels and the diagonal bracing is of adjustable rods.

Cost.

The cost of the three filter units with all necessary accessories was \$9,000 laid down at Sturgeon Falls. The whole installation, including a new main from the pump house to the old water main on John Street, a distance of some 2300 ft. was very nearly \$80,000.

For the above information "The Canadian Engineer" is indebted to L. E. Carter, town engineer, of Sturgeon Falls, who was in charge of the work. The general contractors were McNamara Bros. and Thornton, of Sault Ste. Marie, Ont. The motors and pumps were supplied by the Canadian Blower & Forge Co., Ltd., Kitchener, Ont., and the filters by the Norwood Engineering Co. of Canada, Ltd. The elevated tank was supplied by the Canadian Des Moines Steel Co., Ltd.

FIG. 3—LAYOUT OF EQUIPMENT IN PUMP AND FILTER HOUSE

DISCUSSION ON PAPER "PREVENTION OF SEWAGE CONTAMINATION IN ONTARIO."

DISCUSSION of F. A. Dallyn's paper on "Prevention of Sewage Contamination in Ontario" read at the meeting of the Canadian section American Water Works Association, at Brantford, and which was published in May 23 issue of "The Canadian Engineer," brought out several interesting points. Those taking part in the discussion included William Gore of Toronto, D. M. Hanna, Windsor, and Alex. Milne, St. Catharines.

The chairman, R. C. Harris, in opening the discussion, referred to the importance of the subject and hoped that the discussion would be general.

MR. GORE: Mr. Chairman, I have listened to Mr. Dallyn's paper with very great interest as an authoritative statement from Mr. Dallyn is of very great weight and importance to this Province. Of course as an official of the Government he is in a rather difficult position, but I think he has stated his case very well indeed, and I would like to congratulate him upon presenting the case in such a satisfactory manner.

There is no doubt that we all resent a certain amount of paternalism; we like to be boss in our own shanty, and to a certain extent, although supervision is necessary, we do not like supervision that is too close or that shall prevent a man deciding how he shall control his own house.

I think one of the most important points in Mr. Dallyn's remarks is that the view of the Board is that they are taking only a general view, and that they cannot come to any conclusion except in a general way. No doubt each town or each case must be dealt with on its own merits. Where sewage creates a nuisance and will not enable purification of the water supply to be carried on with any degree of satisfaction, it is very important that that sewage should be purified to a very high degree. The figure referred to in the British Royal Commission is a figure that sedimentation tanks would not carry out, that it would demand higher average purification than we have in our provinces. Our rivers, as Mr. Dallyn said, are relatively very much bigger, and therefore the amount of contamination is exceedingly important.

There is one point Mr. Dallyn referred to which I think cuts both ways, that is, the faster flow of the rivers. A rapidly flowing river purifies itself much quicker owing to its turbulence than a river which is travelling slowly. So to a certain extent a fast flowing river is an advantage.

MR. DALLYN: I was using that illustration particularly with reference to bacterial pollution.

MR. GORE: There is no doubt that the more contamination you have in a sewage supply or in a water supply the more difficult it is to treat that water, particularly in view of the alum. The difficulty is very much increased by the amount of impure material in that water. That will be shown in a later paper. It is largely I think a case of treating sewage as the result of experience. Each case must be dealt with on its merits.

MR. HANNA: Mr. Chairman, just for information I would like to ask through you this question; at what point do the Board stop in the way of acting on the initiative in the enforcing of the laws of the Province with respect to the protection of water supply? I believe from the standpoint of separation of fire lines the Board are acting independently, and I just wanted to know if there was any definite line of programme laid down in that respect?

MR. DALLYN: The question that has been asked is just a little difficult to answer. I will admit that we initiated the question of fire connection, but at the time we initiated it, the matter was under consideration by several of the municipalities, so that instead of limiting it, it was made of province-wide application. If Mr. Hanna could cite a concrete example, we might discuss it. The supervisory power, and the question when we should cease to interfere, were difficult things to deal with in generalities.

MR. MILNE: I regret very much, Mr. Chairman, that I was not in the room when Mr. Dallyn read his paper on

the control of sewage, because to a certain extent I may have been the instigator of the suggestion that such a paper be prepared.

This question has been present to my mind a great many years. On the one hand we have a water supply, and our provincial health authorities come down emphatically and say that that water must be delivered at certain sanitary plants. On the other hand, raw sewage is dumped down at the most convenient place, absolutely without regard to water conditions. The whole responsibility for water supply is being placed upon the authorities alone. I think it is unfortunate that the responsibility should be so placed. If it is compulsory and absolutely necessary to the preservation of life to supply clear, sanitary water, why deliberately, I was going to say with malice aforethought, as our legal friends would say, allow any other department to pollute that supply, thereby placing an almost impossible burden upon the water department? It strikes me that with proper administration of suitable legislation, of which we have evidence in England and in the United States, at least a partial purification of the sewage could be and should be made, relieving the water department of the entire liability for that work.

For that purpose, and not to prescribe means or to suggest legislation, or even the means of purification, my suggestion is that we open a discussion among our members and with Mr. Dallyn, who is very keen to take up anything in the way of public service, which might lead to some better solution of the situation than now exists.

MR. DALLYN: In answer to Mr. Milne's question, which is quite pertinent, I may say that I do not know of any instance of the gross pollution of a water supply by sewage in this Province, except in connection with one or two systems that were put in for fire protection solely, and not supposed to be used for any other purpose. There were one or two cases where the water was grossly polluted. Chatham has some difficult conditions with respect to variations in the river level there, but I do not know of any single instance where the pollution is of such an intense character that it would call for urgent action in respect of sewage treatment.

MR. HOWARD: Mr. Chairman. There were several points in Mr. Dallyn's paper which interested me very much, particularly at the outset, when he mentioned the powers delegated to the Provincial Board. As Mr. Dallyn stated, the policy of the Board is one which commends itself to a municipality, particularly in view of the fact that at the present time the question of sewage disposal is one of the most acute character, particularly in Eastern Canada.

Mr. Milne referred to the treatment of sewage in England and in the United States. We should bear in mind that climatic conditions in those countries are very different, so far as the treatment of sewage is concerned, to what will be found in Eastern Canada, and that the efficient treatment of sewage at the present time would involve enormous expense which, at this stage of sewage treatment, would not be justified, particularly in view of the fact that such a conservative engineer as Mr. Hazen has gone on record as favoring the dilution of sewage as a practical means of disposing of sewage, provided that the water is treated afterwards. I think that is something which commends itself to all interested in this subject. There is the question of expending enormous sums of money on sewage treatment either by filtration or aeration, with perhaps doubtful success under these climatic conditions, or the treatment of sewage with chlorine, is something worthy of serious consideration. It has been found in the City of Toronto, where the sewage discharge is between 60,000,000 and 65,000,000 gallons daily, to get an efficient effluent it would be necessary to have ten or fifteen parts of chlorine to every million gallons of sewage discharged. That would mean an expenditure of from 4 to 5 tons a day of chlorine, chlorine at the present time costing \$250 a ton; in other words, any effective treatment of sewage, putting it down at the lowest figure possible, would involve an annual expenditure of \$350,000, which represents an

enormous expenditure, and literally speaking throwing money in the lake, when we consider that with effective filtration and chlorination afterwards the citizens are supplied with water just as good or strictly comparable with the best water on the American continent.

In 1910 there was a mortality of 40.8 per thousand of population. Effective treatment has reduced that mortality to 2.9.

So that naturally sewage disposal has reached a more advanced stage, and until some better methods of practice have been worked out to a success, the policy should be to go slow and rather filter the water and treat it with chlorine than to expend large sums of money on sewage treatment.

There were one or two points in the later paper* well worthy of consideration. One was the reference to the standards of the International Board. An investigation has been going on for the past year, and from all the correspondence it would seem that the establishment of standards is impracticable. A standard that would apply in one city could not be maintained and would be absolutely impracticable in another city. In one particular city, certain standards might apply for water having a certain percentage or degree of purification, based upon certain quantities of impurities and re-agents. That has been shown all over America to be impossible at the present time; what applies to one city has absolutely no bearing upon an adjoining city, and the application of definite standards would seem to be impracticable. This particular standard the International Commission put up as to the number of B-Coli in water at the present time is an absolutely impossible one, under existing conditions.

We have heard of water supplies which contained enormous numbers in excess of those which sterilization has removed entirely.

*Paper on "Water Supply in its Relation to Sewage Disposal" by J. Clark Keith, appearing in this issue of "The Canadian Engineer."

NEW SNOW PLOW IN WINNIPEG

NOW that motor vehicles are being so extensively used, there is an ever-increasing demand for keeping the roads and streets open in winter. To meet this demand the Vulcan Iron Works, Ltd., of Winnipeg, have developed a new snow plow for attachment to any standard make of motor truck. The plow is fastened to the front end of the truck and pushes the snow to the sides of the road. It may be used either on city or country roads.

Features of this plow are its ease of operation, simple construction and the fact that it requires no attention other than that given it by the truck driver. It may be easily set up and attached to a truck by one man, no drilling of holes or other mutilation of the truck being necessary.

The plow consists essentially of the following parts: The mould board, a hinged frame connecting the plow to the truck; a raising and lowering mechanism; and clamps and brackets for attaching to the front axle.

The mould board, or blade, which is made of steel plate, is carried by a special hinged frame on the front axle, and allows the plow to be set at any angle to the

The application of chlorine was touched upon by Mr. Dallyn. I would be very much interested in knowing what the supervision consisted of, how much chlorine was considered necessary, whether there was a general standard set of figures for the applying of chlorine, and what methods were taken to see that that quantity was maintained.

MR. DALLYN: There are two questions raised by Mr. Howard that I would like to touch upon. The question of the standard of the International Joint Commission has been rather unfairly dealt with. The problem before the International was to determine what constituted an injury to health and property, and it would naturally be discussed with a view to some standard, with 500 B-Coli per 100 c.c. That arose out of what might constitute an injury to a municipality, that is, what is an excessive load to put upon a municipality if the stream had not been affected by sewage discharged by urban development.

The question of what we are requiring in the way of chlorination brings up another question. The engineers of the Board have been considering of late methods of checking up the chlorine, and we have now prepared for distribution outfits which will make it possible for plant superintendents or local officers of health to check up the chlorine.

St. Catharines and other municipalities in Niagara district are to vote on bylaws soon to give the Niagara, St. Catharines & Toronto Railway extensions of franchises. In St. Catharines, Niagara Falls and other places the railway, which is owned by the Canadian Government, has been running without franchises for some time, they not having been renewed because of the negotiations looking to the Hydro taking over the road. As the proposition for the municipalities to buy the railway was voted down by a sufficient number to kill the project, it has been decided by the municipalities to give the Canadian National Railway Board an opportunity to improve the railway.

road. It also permits raising and lowering. This frame is of rigid angle-iron construction and is fastened to the front axle with specially designed steel clamps and brackets, which make it suitable for attachment to any standard make of truck. A locking worm-operated drum and cable, operated from a handle wheel in the cab, allows the plow to be raised to meet travelling conditions.

The lower part of the mould board is hinged and supported by springs which allow the plow to pass without injury over manhole tops, railroad tracks, etc. This is a great improvement over the old method of swinging the entire blade, which leaves a pile of snow in the road.

To prevent injury from contact with street curbs, rollers are attached to the sides of the blade. The plow is equipped with adjustable mushroom shoes to carry the blade slightly off the pavement if desired.

Several of these plows are now in active operation in the city of Winnipeg, where they have caused considerable interest and favorable comment among street and road officials.

TWO VIEWS OF NEW SNOW PLOW IN OPERATION LAST WINTER IN WINNIPEG.

CO-OPERATIVE ROAD IMPROVEMENT AND FUTURE POLICIES*

Remarkable Increase of Traffic — Duty of Highway Officials
— Success of Federal-Aid System — Co-operation in
Selection of Routes — Public Roads Bureau.

By Thos. H. MacDonald,
Chief, Bureau of Public Roads.

WE comprehend now as we have not understood in the past, the influence exerted upon our national life by transportation. It is the factor we find now interposed between supply and demand, between the starving thousands and food supplies, between producer and consumer. It is the factor whose absence separates, and whose presence ties together communities, States, and the nation as a whole. To supply adequate and increased transportation facilities is the motive which has influenced the American people to increase the number of motor vehicles in use since 1910 more than 1800 per cent. To provide the complement of the motor vehicle, the improved highway, is the underlying reason why the larger funds have been made available from State and Federal sources. The proper combination of these two to serve a definite purpose in the nation's economy, this is highway transportation in the making.

The widespread opposition to State programs of highway building during the years from 1910 to 1916 when motor vehicles were increasing at an unforeseen rate, the increased funds made available following the Federal Aid Act of 1916, the stagnation of actual expenditures during 1917 and 1918, the competition of industry of 1919 for materials, labor, and even more important, for rail transportation; all these have played a major part in producing the wide difference between the improved highways demanded by 9,300,000 motor vehicles and the actual new mileage constructed.

Heavy Traffic Increase.

The record for 1920 and 1921 is better, but let each State highway department make plain to the people of its State that for less than three years of the past five since large funds became available, have conditions permitted highway construction on an increasing scale. The facts which are true of construction are true also of maintenance.

The conclusions are self-evident:

1. During the period 1910-21, the potential number of motor vehicles demanding highway service increased more than 1800 per cent; our actual expenditures for construction and maintenance increased about 400 per cent.

2. During the period 1910-1918, motor vehicles increased more than 1,100 per cent, highway expenditures about 140 per cent.

3. During the period 1918-1921, motor vehicles increased about 700 per cent, and highway expenditures about 260 per cent of the 1910 figures.

But even these figures do not truly represent the differential between the demands for highway service and our actual production. Without attempting impossible refinements, if the cost index of 1918 be taken at two and that of 1910 at one, the actual increase in production of 1918 over 1910 was only 20 per cent, and if the index for 1921 is taken at 1½, the actual increase in production of 1921 is only about 233 per cent over the 1910 figure. That is, taken as a national aggregate, the number of motor vehicles, all at least potential users of the highways in some degree, has increased in eleven years since 1910 more than eighteen times. Our greatest annual production of serviceable highways measured by the construction and maintenance expenditures has been not more than two and one third times the production of 1910, and it has been only within the past three years that the production has gone forward at a rate approximating the maximum.

*Paper read at 7th annual meeting of the American Association of State Highway Officials, Omaha, Neb.

Those who are a part of these organizations have the good fortune to be engaged in their chosen field when the greatest development that can ever come is taking place. The first two or three years of something more than a decade of major road building have passed. What has gone before has been largely preparatory, a period of organization. What will come after, perhaps ten, perhaps fifteen years later, must by then be largely standardized, largely routine. The highway organizations that come after will not have such opportunities to render good, or, equally true, bad service, or be able to progress so far in a limited time in advancing highway engineering and administration, and in combining the motor vehicle and improved highways into scientific highway transportation.

The American Association of Highway Officials must awaken to the responsibility of placing before the public at large the real facts concerning highways and their relationship to highway transportation service. It must speak with authority and emphasis. It must take upon itself the serious responsibility of leadership in directing public thought and education, not by the arrogant methods of the demagogue, but by the intelligent dissemination of facts and principles founded upon knowledge and experience.

I do not wish to fall in showing my belief and enthusiasm in the possibilities and opportunities that lie ahead of the highway organizations. But I wish less to fail to place upon the conscience of each individual, regardless of the rank he holds, his responsibility. I want to see this organization accept the fact that the success of the future highway program is dependent upon the character and ideals maintained by the component forces, and that the failure of any one of these, Federal or State, reacts adversely upon the whole.

Order of Progress.

It is not possible to define for a definite period of time the exact progress made for the United States as a whole, for there is no fixed point common to all the States. Yet, from the standpoint of highway service, I list our outstanding progress for the past two years in this order.

1. The increased highway service made possible through the establishment of proper methods and the expenditure of more adequate funds for maintenance.

2. The increased highway service resulting from new construction.

3. The adoption and enforcement of better engineering standards.

4. The improvement in the administration of highways as a public utility.

Although the new construction has been very large, the mileage of highways of all types that have been brought to a serviceable condition or restored after a period of inadequate repair, is still greater. The outstanding results secured from the distribution of the large quantities of war surplus materials and equipment are found in the better and more extensive highway maintenance made possible. The Bureau of Public Roads estimates that by the end of the year, war surplus to the amount of approximately \$150,000,000 in value will have been distributed for use in highway improvement.

As of November 30 the records of the Bureau of Public Roads show that of the total allotments to the States under the two first appropriations totalling, \$266,750,000, there has been placed under agreement with the States Federal-aid funds in the sum of \$214,649,269, for 28,601 miles of highways. Of this mileage there has been completed the equivalent of 23,000 miles. You will note, therefore, that there now remains the balance of \$52,100,000 to be placed under agreement from the old appropriation.

As a foundation for the consideration of future policies under the new legislation, the Secretary of Agriculture has authorized and requested me to express clearly and without reservation his position that in the formulation of the new rules and regulations required, and in the administration of the law, the Department will request the coun-

sel of this Association through its proper committee. The Secretary is greatly impressed with the possibilities and responsibilities of the new Act, and the truly cooperative spirit which must underlie the functioning of both the State and Federal organizations to make the greatest and surest progress.

Federal Aid System.

The Act itself is remarkably comprehensive in defining and demanding a systematic plan, national in its extent, for future highway development. None of us has had, or is ever likely to have a more serious responsibility than the one imposed of selecting the Federal-aid system to be composed of the most important highways, articulating not only within the States, but with the systems of the contiguous States. Here is an opportunity to do a big, basic work, such as comes to few in the course of a life-time. The individual who fails to vision the importance of the task has no moral right to hold a position of authority in its performance. From a conception of highways as a purely local institution, a viewpoint we held for over a half century of our national life, we progressed to an acceptance of their importance to the State. This attitude persisted for another quarter of a century, until through the universal use of the motor vehicle, the transportation crises of a great war, the repeated threats of extensive railroad tie-ups, and the results already secured with Federal aid, we have, in the short period of five years, seen our more important highways extended and interconnected to form a vast network, serving local, State and national traffic, only limited by the confines of the United States. This is the conception which has been written into the law, and which, because of the projected effect of that which is done now into the future, lifts the importance of this requirement, that is, the selection of the Federal-aid system, above any other principle or duty therein announced.

There can be no doubt as to the clear intent of the law to provide for a system of roads which shall include those which are now and which after improvement are to become the major traffic lines. The different stages of improvement to which the States have progressed, and all the variations between them of topography, of population distribution, of industries, of development of natural resources, must necessarily be reflected in the laying out of the system. These details must be worked out between the States themselves and between the States and the Bureau of Public Roads. Because of these wide variations, it is only possible to suggest some of the major considerations. We do not minimize the importance of the local traffic to care for this class properly will, in general, always be the first objective of highway improvement. Our conception is rather that a choice of highways shall be made which, regardless of the order of improvement, will eventually join into a well conceived network crossing both county and State boundaries. Thus, while the immediate needs of a State or a district may determine priority of construction, each new link brings nearer the completion of the system as a whole.

Selection of Routes.

In the Western States the major lines will be largely fixed by topography, but by the same token, because long routes will be determined by single strategic points such as a mountain pass, it is the earnest hope of the bureau that the States affected will reach an agreement based on the future service that is to be rendered, not only to the local, but also to the Interstate and national traffic.

In the Eastern States, some of them with a large mileage of improved roads, it might appear that the selection of a system is not so important yet it seems to me that it is here that our greatest traffic problems lie. It will be a comparatively short time, because of new construction and better maintenance, until the trans-continental tourist will be provided with roads that are entirely serviceable throughout the seasons of the year when other conditions favor such travel. The really serious traffic problems lie around and between large centers of population. It must be re-

membered that for roads built previously many engineering details such as alignments, widths and types were planned prior to the advent of the motor traffic, and for use of the slower, lighter, horse-drawn vehicles. The considerations of weight, speed, safety, and numbers, which now must govern design, had not yet become the controlling factors. The traffic lines are from town to town, and in general follow through the most congested parts of population centers. As some of the principles which we must properly work out, the following are suggested.

1. The development of parallel lines to divide heavy traffic through thickly populated districts.
2. The development of direct, short-mileage routes, although on these routes there may now be a less amount of improved roads than on routes now followed.
3. The building of inner or outer belt lines around congested centers.
4. The reconstruction of weak sections for heavy truck traffic.
5. The widening of main routes near the largest cities or between cities where the distance is short enough to carry uniform traffic.
6. Proper connections with the routes of adjoining States.

Possibly there are many questions as to the future surfacing policies. The changes in types and specifications which will be sought from time to time by the bureau will be based upon the more accurate knowledge which is being obtained rapidly through research and through the detailed studies of the behavior of modern designs under traffic. The requirement of the 18-ft. surfacing is construed to mean that this is fixed as the minimum two-way road, where the construction is to be considered complete as first put down. This requirement will not preclude the building of a narrower pavement in those districts where the traffic does not yet justify the two-way width. I am yet to be convinced that we may not properly build now in many sparsely populated districts one-half of the final width of pavement in order to complete mileage between points, if all the other work is done to provide for the full-width construction later.

Highway Maintenance.

To insure maintenance, the strongest possible requirements have been written into the law. The Department may not slight its responsibility, and the attitude of the whole national administration demands the utmost fidelity in the continuous upkeep of the highways built. We are not left in doubt as to the meaning of the word "maintenance." The law itself states, "the term maintenance means the constant making of needed repairs to preserve a smooth surfaced highway." Further, "such State shall make provision for State funds required each year * * * for construction, reconstruction and maintenance of all Federal-aid highways * * * which funds shall be under direct control of the State Highway Department."

The bureau earnestly hopes that it will not be required to take over a single mile of highway for maintenance, but the responsibility is imposed, and this provision of the law will be enforced to the letter. It is a well established principle that proper maintenance will result only if some form of patrol is organized that places direct and continuous responsibility upon someone for the condition of each mile of road, and the bureau will not consider that the States are properly living up to the requirements of this Act until such a system is established. I do not use "patrol" in the technical sense to distinguish it from the so-called "gang" system, but rather to designate the proper combination of patrol and gang systems to meet the particular conditions of each State.

It is not necessary to touch upon all the points of the law. I have endeavored to accent the establishment of the system of Federal-aid roads as beyond all other principles, the most important written into this law. Of only slightly less importance is the requirement as to maintenance. While our thoughts may run to large construction programs, and the details of types and materials to be used,

let it be remembered that we are providing highway service, and that the degree of service rendered is determined by the lay-out of the system, and by the condition in which every mile of road within that system is maintained constantly. Every State which has established a State system of highways has found those highways almost immediately abandoned by the counties or other local subdivisions. I trust that each State in which highways are taken into the Federal-aid system, which have not up to this time been established as State highways, but have been under the jurisdiction of the local boards, will recognize this principle and make immediate plans under which all parts of the system will come under the jurisdiction and maintenance of the State without waiting for their construction.

Public Roads Bureau.

The Bureau of Public Roads will proceed under the provisions of this Act on the assumption that each State will recognize the mutual responsibilities imposed upon the State and upon the Federal organizations, and will bring its operations at once into harmony with all the provisions. Also, that each State will in fairness recognize the greater responsibilities, restrictions and requirements imposed upon the Federal bureau. The bureau does not seek initiative. It does not seek to direct the States but to co-operate with them. There is now a plan of action for the guidance of both organizations that is so clear and so explicit that neither can escape the responsibilities imposed. The Federal requirements are fairly defined and will be sincerely and faithfully enforced.

It is evident that a great misconception exists in the public mind as to the service which is being rendered by the highways. During the very long period that construction and maintenance were lagging far behind the increase in traffic, it is not to be wondered at that our highways showed a material depreciation. Through the war period, with the greatly increased use of heavy traffic units, particularly at just the seasons of the year when the road surfaces are carried on weakened subgrades, some roads did break up seriously. But this depreciation in general has not continued, and more than this, the effect of the lag in maintenance has been practically obliterated by the increased maintenance during the past three years, and by the reconstruction of the weaker sections, until our roads are in a far better condition today, than they have ever been in our history. This fact in itself controverts successfully any general accusations against our modern highways, of failure to carry the loads imposed.

The whole purpose of highway building is to make possible highway transportation, and the cost of the transportation must be reduced as low as possible. Therefore, restrictive legislation which limits too greatly the loads to be hauled on the highways should not be tolerated, as it is against a proper public policy. Legislation regulatory of the traffic on the highways should take into account that there are many factors which govern the traffic depreciation of our highways. Laws which blindly fix some maximum weight to be moved on the highways may prohibit the really profitable traffic and allow less economical and more destructive vehicles to operate practically unchecked. Both weight and speed are major factors in their destructive effect upon the highways, but the distribution of the load, the relation of the sprung and unsprung weights, the tire equipment, all have an important effect. From the research of the past two or three years, and from the practical experience of the highway organizations, we are accumulating sufficient knowledge to engage understandingly on a determination of the character of legislation which will result in a sound public policy. The solution of highway transportation lies in the proper adjustment, no less of the motor vehicle to the road than of the road to the motor vehicle. I hope to see no conflict develop between the States in the determination of traffic regulations. Such would destroy in a large measure the utility of the Federal-aid system of primary highways. Rather, because the system will for a long time be non-uniform in its carrying capacity, much

discretion should be allowed the State highway departments in determining the loads which are to operate upon specific sections of highways, and further, much discretion should be allowed the departments in the making of seasonable restrictions where climatic conditions are such that there are periods when the roads, normally fully capable of carrying heavy loads, are for a short time carried on uncertain subgrades. Here is an opportunity for the highway builder and the motor truck manufacturer to cooperate to serve the public's interest.

One other point is causing the public much concern. It is often stated that highways have gone to pieces and must be re-built. Engineers have been prompt to develop methods of improvement which are salvaging practically the full value that was originally invested in the highways. For example, some of the older macadam roads in New York State, lightly built, which are now heavy traffic lines, have been widened by concrete roadways on each side, preserving a strip of macadam, say 6 ft. wide in the centre, thus giving a 24 ft. usable surface by the addition of 18 ft. of new construction. The remainder of the macadam width is scarified and the material spread to form a better base under the new construction. This is only one example. There are so many successful operations of like reconstruction that it may be taken as a principle that if roads are well maintained they may be reconstructed, when traffic becomes so heavy as to require it, in such a way as to preserve the major part of the investment and build it into the new highway as an integral part. It is my judgment that our heaviest traffic lines of the future will be developed in this manner, for we must recognize the principle that at the present time the big task is to get a mileage of surfaces that can be maintained under the traffic. Perhaps the principle that we should remember it to do the fundamental work right. Road surfaces are built for use and we must expect them to wear out. The one thing that we must do is to furnish highway service, for this is an essential factor of highway transportation, and we must rely on highway transportation to pay the major portion of the costs of the whole construction and maintenance program ahead.

TESTS ON CONCRETE PIERS

ACCURATE data on the sustaining power of cylindrical concrete foundation piers and the underlying stratum on which they rest has been obtained by means of experiments which have been conducted in the United States. Two test piers were constructed. Each pier was 4 ft. in diameter. One of the piers had a belled base to furnish a bearing surface 8 ft. 4 in. in diameter. The other pier was a plain cylinder. Concrete for the major portion of the test piers was of 1 : 2 : 4 mix. A richer mixture, 1 : 1 : 2, was used for the upper 4 ft. 4 in. Fine aggregate was sand and coarse aggregate was 1 in. crushed limestone. The upper portion of each pier was reinforced with eight $\frac{1}{2}$ in. round steel bars 6 ft. long, placed vertically in a circle 2 $\frac{1}{2}$ in. from the outer surface of the pier. Outside of these vertical bars, thirteen $\frac{1}{2}$ in. hoop bars with 24 in. laps were placed horizontally on 4 in. centres. Hoop bars reinforced the piers from 2 in. below the upper surfaces of the piers to a depth of 4 ft. 2 in. A load of 340 tons, equivalent to about 6 $\frac{1}{2}$ tons per square foot, of bearing surface was applied and allowed to remain for forty-eight hours. The total deflection was 3/16 in. The load was finally increased to 970 tons, or about 18 tons per sq. ft. of bearing surface. The load remained on the pier for eight days and the total deflection was 1 $\frac{1}{2}$ in.

The Edmonton Automobile and Good Roads Association has secured the services of P. A. Parrish to organize sections of the Association in all the rural towns tributary to Edmonton. The Association has also engaged an engineer, S. E. Reaugh, to make a survey of the proposed Jasper highway.

FIRE PREVENTION A PATRIOTIC DUTY*

By Harold S. Weldon,
Canadian Inspection and Testing Co., Ltd.

DURING the year 1921 the fire loss of Ontario, as determined by the Fire Marshal, was \$15,444,817, an increase of nearly four million dollars over the year 1920. The number of fires was 9813, an increase of 517. Over one million dollars a month is the loss to Ontario of property, due chiefly to our carelessness, and during this year the number of fires should have shown a decrease, rather than an increase. For the year 1922 what are we prepared to do to help stop this wanton destruction of life and property, 80% of which is preventable?

Too few people realize that Canada's fire waste is stupendous, and is, in fact, the largest per capita of any country in the world. Thus it is very plain that the facts concerning the prodigal dissipation of our national wealth cannot be too frequently or too forcefully presented for public consideration and analysis. This direct loss of millions can be prevented, and the money thus saved used to build up the resources and assets of our country; for when any factory, store or any of the nation's assets are burned, the nation's life and vitality are weakened, since its citizens are thrown out of employment, and the circulation of large sums of money, through the weekly pay roll, ceases.

Every citizen should, therefore, support every possible remedial measure that will reduce the destructive results of fire, and incidentally, the price we shall have to pay for permitting carelessness and difference to sap our resources! This may be brought about by:

(1) Suggesting a better measure of community planning, with proper restraint of the use of property, and the efficient co-relation of all elements of the community in order to reduce the fire hazard.

(2) Insisting on sufficient community protection, if not already provided, consisting of an adequate water supply, and a fire fighting organization.

(3) Urging a better type of building construction, that will provide against danger to life, in case of fire, such construction to include proper mechanical aids for the discovery and extinction of fire.

(4) Advocating a type of construction, that will prevent the spread of fire beyond the buildings in which it originated.

Thus fire prevention involves the construction and maintenance of buildings so that the danger of fire may be minimized. The precautions which should be taken, may perhaps be dealt with best, by considering the subject under a number of headings.

Manufacturing Section.

Factories and industrial plants are responsible for approximately 50% of the total annual loss. Each industry carries with it, its own special fire hazards, and each employer should see that his property is well equipped with fire fighting appliances, and that his employees are acquainted with their use. He should also impress upon his employees the necessity of observing proper precautions to prevent fires, and also that a fire may mean that they may be thrown out of employment. In any plant a watchman should be employed at all times when it is not in operation. There should be some mechanical device installed at different points of the plant, which will record the time of each of his visits, and he should be thoroughly acquainted with the system of fire protection, and know how to use it.

All shafting or machines equipped with belts should be grounded to prevent sparks which may be caused by static electricity. All oily waste should be put into recep-

tacles with self closing lids, and the contents from these metal cans burned daily.

Cleanliness is one of the most important factors in any plant for the prevention of fires. If in the shipping and receiving rooms, all waste is gathered regularly and burned or stored in tin lined boxes, and all boxes of supplies piled in tiers, and spaced, to permit of easy access, and inspection, much will have been accomplished.

In factories where dust is prevalent because of the commodity manufactured, such as flour, sugar and starch, or where dust may be caused, as when coal or grain is handled, the greatest precautions must be taken to prevent this dust, either from settling out on beams, etc., or from passing out into the rooms where it is then entirely surrounded by air, thus promoting rapid burning. It has been found that this is the most inflammable part of the dust, and if mill operators would realize that this dust may be ignited as easily as some gases, and that under proper conditions an explosion may propagate through it as rapidly, and with as great force as the explosion of certain gaseous mixtures, it is probable that greater precautions would be taken.

While no explosions have been known to have been started by the ignition of dust settling on a carbon filament lamp, nevertheless the breaking of almost any type of electric lamp bulb in a dusty atmosphere may cause an explosion. A match will ignite almost any inflammable dust, including a cloud of aluminum dust.

If we are to prevent explosions, everything possible should be done, both to remove the sources of ignition, and control the dust wherever possible. Open flames of all kinds should be prohibited; carbon lamps should not be used; all lamps should be protected with vapor globes, and with heavy wire guards; all electric switches should be enclosed and every possible precaution should be taken to prevent friction with consequent development of heat or sparks.

The manner in which dust may most successfully be removed, is by installing a suction plant, which will draw off to a closed container, designed for the purpose, all dusts which can be easily collected, such as in grain elevators, where there is a throw of grain.

The installation of an automatic sprinkler system cannot be too strongly stressed, such system to be periodically inspected and tested.

In order that fire cannot spread from one floor of a building to another, fire proof stairways and elevator shafts will give the most efficient protection, and fire walls with fire doors properly installed, will prevent a conflagration from spreading to adjacent departments when situated on the same floor.

Fire Prevention In the Home.

Two out of every three fires occur in our homes. It is yesterday's dirt that always starts the fire. The element of carelessness probably has less check in the home than elsewhere, as is witnessed by the many and varied causes of fires in the home. Old clothing and useless articles stowed away in the cellar or attic; defective chimneys; matches being carelessly placed in improper places, or where children may reach them, placing ashes in wooden receptacles, and the careless use and handling of coal oil, whether in lighting a fire, filling lamps at night, or leaving lighted lanterns in dangerous places. These are only some of the causes of many families being left homeless.

Special care should be taken to prevent fires starting in the home, because before outside help arrives, serious damage is usually done.

At the present time there is a world wide housing shortage, and the present wastage of homes per year, due to fires, is one quarter of the total number built, in the corresponding twelve months. The day when there will be surplus homes would arrive much sooner if this wastage could be eliminated.

The protection of forests from fires, is today one of the great problems of our country, especially in those reg-

*A winning essay in the recent competition conducted in the Faculty of Applied Science, University of Toronto, for prizes offered by the Fire Marshal of Ontario.

ions where there is the virgin forest, with years of accumulated debris. The advent of the railways, with the subsequent lumber, tie and pulp operators, also create a very serious hazard.

More than four times as many people are burned to death in Canada as are killed on steam or electric railways. Thousands of acres of good timber lands are burned in each year because of the carelessness of settlers and tourists.

Each year the government appoints a large staff of fire rangers, whose duty it is to detect and fight fire, but despite this large staff, each year much good timber is lost. It is estimated that over 50% of forest fires are caused by campers, railways, incendiarism, bush burning and lumbering.

The most effective way to prevent these fires is by each one realizing his own personal duty and refrain from carelessly lighting and leaving fires, or dropping a lighted match.

Fire Stopping in Frame Buildings.

The importance of fire stopping, in frame constructed buildings, for the purpose of retarding the progress of the fire, after its origin is, indeed, well established, and especially applies to the countries where construction is more or less temporary, and is of frame character. In buildings the greater proportion of fires, are of interior origin, and therefore some method of fire stopping is essential.

The principle to be applied in fire stopping in frame construction is that of closing up all vertical openings between studs, and all horizontal openings between joints, thus preventing the rapid circulation of fire by draft through the frame after the fire has been started. Fire stopping, preferably by the use of incombustible material, laid in between studs, to a height of from 4 to 6 in. will tend to confine a fire to a cellar or basement, and prevent its rapid spread to stories above, through spaces between the studs. It will also prevent fires starting in the attic, from spreading to the floor below, because of sparks falling down through the openings between studs.

Precautions in Using Electricity.

Before any building, factory or barn is wired, a permit must be obtained from the Hydro-Electric Power Commission, and it is necessary that only skilled electricians be employed.

In interior wiring, the most common cause of fires are poorly designed fittings, poor workmanship, carelessness, improper materials, and the misuse of materials, designed for a certain service. Flexible cord, designed for pendant use only, is a material much abused, and has been the cause of much trouble.

The over fusing of circuits offers a very serious fire hazard, and is very often due to the so-called "handy man". This is a punishable offence, as fuse holders must not be filled with other than approved fuses of a proper carrying capacity, or must not be bridged with wire, or other objectionable material. All fuse blocks and knife switches should be enclosed in steel boxes, especially when exposed to inflammable material, or when there is any chance of personal contact.

Special attention should be given to seeing that heaters, small motors, etc., are not connected to the ordinary lamp sockets, and for these appliances special wiring should be installed, sufficiently heavy, to carry these loads.

As in the case of the prevention of accidents, the personal factor is of very great importance in the prevention of electrical fires, and it is only by gaining a knowledge of how to use these devices correctly, and then being careful to use them always in this way, that loss of life and property may be prevented.

Fire Prevention by Lightning Rods.

From records kept by insurance companies, lightning rods have proven to be from 95% to 100% efficient, or in other words where 100 buildings have been properly equipped with lightning rods, less than 5% of the buildings were struck with lightning, and it is very probable that in these few cases, their installation and maintenance was

faulty. Copper rods are the most serviceable and the maintenance costs in time and money are very small. All machinery, etc., in buildings, should be grounded, as should silos and metallic roofs. All rods should be grounded 10 ft. deep in earth, which is always moist, or provision should be made to keep the ground moist.

It is the duty of every good citizen to join the great army of fire preventionists. Perhaps the most important manner in which each can do his share, is to appreciate his personal responsibility in connection with the prevention of, and protection from, fires.

PEACE HIGHWAY PROJECTED.

CANADA, the United States and Mexico are now being linked together by an international trunk line connecting Quebec with Mexico City and running northeast and southwest through some of the greatest industrial cities of the United States. It is known as the International Peace Highway.

Almost the entire 2,700 miles from Quebec to Mexico City have been practically decided upon. Two debatable routes through a part of the mid-west are all that now remain to be settled upon. By June or July, the Peace Highway will be marked out by automobile clubs in all the States through which it passes.

These markers are themselves a bit of sentiment that cannot fail to arouse good feeling as well as patriotic fervor in both Latin and English-speaking nations. Triangular in shape, a white field is enclosed by edges of red, green and blue, combining the colors of the three nations. Those of Canada and the United States red, white and blue, are thus blended with the red, blue and green of Mexico.

Route of the Highway.

The road will run through the following cities: Quebec, Three Rivers, Montreal, St. Johns (Canada), Rouse's Point (N.Y.), Ogdensburg, Clayton, Watertown, Oswego, Rochester, Buffalo, Erie, Cleveland, Columbus, Cincinnati, Frankfort, Lexington, Louisville, Henderson, Paducah, Cairo, across the Mississippi on a bridge which will join Kentucky, Illinois and Missouri, Poplar Bluff (Mo.).

Between Poplar Bluff and Dallas alternative routes have been suggested. The first is from Poplar Bluff to Springfield, Mo., through Joplin, Muskogee, Okla., on to Dallas. The second goes to Dallas by way of Little Rock, Hot Springs and Texarkana.

From Dallas southward the highway runs through Waco, Austin, San Antonio and Laredo, Texas, across the state of Nuevo Leon to Monterey, to Saltillo and then through San Luis Potosi, Dolores, Queretaro and Tula, to Mexico City.

UNCERTAIN ASPECT OF ST. LAWRENCE SCHEME.

WHETHER further steps will be taken to negotiate with Canada regarding the Great Lakes-St. Lawrence waterway project has not yet been determined by the Washington Government.

Canada's reply to the first American proposition, suggesting that the time is inopportune to open such a question, has brought the discussion momentarily to a standstill. State department officials say, however, that they had not yet carefully examined the Canadian note and were uncertain whether it closed the door to further exchanges.

In some quarters, in Washington, the impression prevails that a way will be found to create a commission to inquire into the feasibility of such a waterway.

Reports from St. John, N.B., indicate that the New Brunswick Power Co., contemplates making extensive improvements to the plant. The firm of Sanderson & Porter of New York will direct the management and operations of the company under the immediate supervision of the new manager, M. A. Pooler.

WATER SUPPLY IN ITS RELATION TO SEWAGE DISPOSAL*

Pollution of Detroit River — Remedial Measures Suggested
— Reference to International Joint Commission's
Report — Sewerage System Constructed.

By J. Clark Keith,

Chief Engineer, Essex Border Utilities Commission.

THERE exists along the Canadian side of the Detroit River in Essex County, a peculiar situation, without parallel in Canada. Eight municipalities with adjoining boundaries front on the river over a distance approximately ten miles, each with its own municipal government but all on the same drainage basin and each vitally concerned in its sanitation in relation to its upstream neighbor. There are no outstanding topographical features in any portion of the district, it is universally flat, the difference between contours being about 25 ft. With this condition existing the problem of drainage is an acute one inasmuch as it all must have its outlet in the Detroit River which is the source of the district's water supply.

International Joint Commission's Standard.

In the final report of the International Joint Commission in 1918, a board of advisory engineers from United States and Canada, among whom was the provincial sanitary engineer of Ontario, made a resume of testimony which was submitted to them which has a direct bearing on this subject and from which some excerpts are given. "In waterways where some pollution is inevitable and where the ratio of the volume of water to the volume of sewage is so large that no local nuisance can result, it is our judgment that the method of sewage disposal by dilution represents a natural resource and that the utilization of this resource is justifiable for economic reasons provided that an unreasonable "burden or responsibility" is not placed upon any water purification plant and that no menace to the public health is occasioned thereby.

Much discussion centered on what was implied in the phrase "burden or responsibility" and the advisory board stated that the safe loading of a purification plant was exceeded if the average number of B. Coli exceeded 500 per 100 c.c. or if in 1/10 c.c. B. Coli is found 50% of the time.

In view of the progress which is being made at the present time in sanitary science, this limit or standard should be regarded as tentative. This is probably a very conservative limit as a filter plant has been constructed on the island of Bob-lo almost at the mouth of Detroit River and from which excellent results are being obtained.

It was further stated that "in general, protection of public water supplies is more economically secured by water purification at the intake than by sewage purification at the sewage outlet but that under some conditions, both water purification and sewage treatment may be necessary."

There will probably be general acceptance of the latter finding as a temporary interruption in sewage treatment or contamination from an obscure source or a single individual might at any time endanger the health of an entire community if entire reliance is placed on sewage treatment alone.

Alternative Methods.

Sewage disposal may bear a varying relation to water supply in their relative treatment.

(1) A filtered water supply in conjunction with sewage disposal in accord with the more approved present day methods.

(2) The water supply unfiltered but with effective sewage treatment.

(3) The water supply unfiltered with sewage treat-

ment which will prevent nuisances and protect fish life. The absolute merits of any remedial measures must in almost every case be considered from the economical aspect as well, a compromise between the two may generally be effected and be acceptable. In Great Britain and Germany practically all surface waters are filtered and if this principle were adopted in Ontario, then sewage treatment to the extent of removing nuisances might be considered effective.

The most serious pollution of any of the boundary waters is found in the Detroit and Niagara Rivers. This pollution has its origin chiefly in the sewage and storm flows from the riparian cities and towns and the sewage from vessels. Extensive analyses were made by the International Joint Commission in 1913 and the B. Coli count varied from 5 per 100 c.c. at the head of the Detroit River to 10,592 per 100 c.c. at Amherstburg. In 1920 a further series of analyses were made by the Provincial Board of Health as a guide to a board of engineers reporting on a water supply for the Essex Border District and there was an average increase in pollution of 50% in that interval notwithstanding extensive improvements in the sewage systems of the District.

Morris Knowles' Report

The border municipalities realizing that independent action in regard to their sewage problem as affecting their water supplies would be fruitless of concrete results, co-ordinated their activities by the formation of the Essex Border Utilities Commission in 1916. The town of Ford, upstream from Walkerville and Windsor was without any adequate system of sewers and approval of piecemeal construction was withheld by the Provincial Board of Health. This condition could not be prolonged indefinitely and in 1917 an extensive report was made to the Essex Border Utilities Commission by Morris Knowles dealing with the related questions of sewage disposal and water supply. It was recommended (1) that an intercepting sewer be constructed from Pelee Road in Ford City along Sandwich St. through Ford City and Walkerville to an outlet in the Parent Ave. sewer in Windsor. (2) that an intercepting sewer be constructed from 14th Street in Ojibway, following Main St., Sandwich St., and Russel St. with its outlet at Park St. in Sandwich.

Sewerage System.

These two questions were submitted to the ratepayers of Ford, Walkerville, Windsor, Sandwich, Sandwich West and Ojibway and their construction was favored by a vote of 7 to 1. The cost was apportioned among them, taking into consideration area, population, assessment and "capacity times distance" as bases. As an economic factor the interceptors were designed for sanitary flow only with storm overflows into the river. These overflows are regulated by means of positive action floats and sliding gates to admit to the interceptors at all times an amount equivalent to the dry weather flow of the district. Owing to the small available slope, it was necessary to construct a sewage pumping station at Walkerville which would lift the sewage from these two municipalities about 18 ft. to a sewer continuing along Sandwich St. to the Parent Ave. outlet. The operating cost of this station is borne by these two municipalities in direct proportion to the amount of sewage they contribute to it, records being available through venturi meters at their boundaries. The eastern section together with the Walkerville pumping station was completed in February, 1920. The southern section was completed in May, 1921, and as a result five miles of the river front were freed from sewage pollution, nine objectionable sewage outlets were eliminated and all the sewage from the towns of Ford and Walkerville enters the river below the intakes of the Walkerville Water Co. and the city of Windsor. The quantity of sewage so diverted amounts to about 2 1/4 millions gallons per day or is equivalent annually to the total flow of the Detroit River for ten minutes. Eventually the sewer will be constructed across Windsor to a disposal plant in Sandwich. When the International Joint

*Paper read at the annual meeting of the Canadian section American Water Works Association, Brantford, Ont., May 12-13, 1922.

Commission issues the ultimatum that the pollution of boundary waters must cease, the Essex Border District will have the work well under way.

Proposed Filtration Plant.

While the construction of these sewers was in progress, there was a periodic demand for filtration due to seasonal disturbances in the water supply. Within the past five years plans for filtration plants have been prepared for both the Walkerville Water Co. and the Windsor Water Commission. Neither of these water organizations had taken any action as there was at the same time a feeling in the district that a joint plant might be constructed which would effect economies for all concerned.

Reports on joint schemes were submitted in 1917 and 1919 but they did not offer a satisfactory solution to all interested parties. In 1920 a joint board consisting of F. W. Thorold representing the town of Walkerville, E. M. Proctor the city of Windsor, and Morris Knowles the Essex Border Utilities Commission, brought in an unanimous report which they recommended from the viewpoint of economy and of the future growth of the district.

The recommendations in brief were that an intake, low lift pumping station and filtration plant be constructed at Strabane Ave. in Ford City and that filtered water be supplied through a gravity main to the pumps of the Walkerville Water Co., and the Windsor waterworks. These pumping stations would distribute water as they are now doing for the next thirty years when an existing water franchise expires or until amalgamation of the Border Cities became an accomplished fact.

As a result of a recent conference, the question of the construction of this plant will be submitted to the electors in December next.

Notwithstanding the elimination of the sewerage from the river front above the present intakes in Windsor and Walkerville, there is a growing increase in pollution. At the outlet of the Parent Ave. sewer there was an average bacterial count of 10,650 B. Coli per 100 c.c. in 1920, a figure which could only be obtained much lower down the river in 1913. This same condition is no doubt apparent not only in boundary but inland waters as well and the one safeguard for the health of this province would appear to be in strict provincial or international control, resulting in adequate treatment both of water supply and its complement, domestic wastes.

WILL SURVEY FORT WILLIAM AND DISTRICT

ACTING under instructions from the topographical division of the Dominion geological survey, E. E. Freeland, topographical engineer, will carry out a topographical survey of the two cities of Port Arthur and Fort William and the surrounding district, including an area of about 250 square miles of land, not including the area covered with water.

The district to be covered by this survey will run north to include Bare Point and Wild Goose Island, the western line will include Murillo, the south line will run through the center of Loch Lomond and the eastern boundary will include Silver Islet.

The maps which will be made, following this survey, will show the elevations and contour lines, streams, lakes, marshes, roads, buildings, bridges and railways, while the portion of the maps including the cities will indicate railway yards, with the tracks, as far as possible, the business section and thickly built-up residential sections will be conventionalized, while the houses on the more scattered sections will be indicated separately. Incorporated in this map will be a map of a portion of Thunder Cape, made two years ago by Mr. Bartlett, of the geological survey.

By conventional signs the good roads and poorer roads will be distinguished, which will make the map very valuable for autoists and tourists. The original scale of the maps prepared by Mr. Freeland will be 3,000 ft. to the inch, but in the completed map, as published, this scale will be reduced to one mile to the inch.

SCHOOL OF ENGINEERING RESEARCH, UNIVERSITY OF TORONTO*

By Maitland C. Boswell,

Associate Professor of Organic Chemistry, University of Toronto.

UPON the recommendation of the late Dean Ellis the School of Engineering Research of the Faculty of Applied Science and Engineering of the University of Toronto was established in the spring of 1917. It is under the direct supervision of a committee of management composed of fifteen members of the faculty council. To this committee is entrusted the selection of researches to be undertaken, from among those proposed by members of the staff, and the disposition of funds for conducting them.

The School was organized chiefly for the training of graduates in the methods of research, and for the carrying out of investigations. These latter may be problems relating to specific industries or raw materials and having a specific end in view, or they may be general problems having to do fundamental principles. A number of research assistants are appointed annually in the various departments of the faculty to carry on the work of research, under the direction of members of the staff. The facilities of the School are also open to other graduates, who may wish, either to obtain more experience in research, or to carry on investigations arising out of their own work since graduation.

A modest request for funds for the salaries of research assistants, and for the purchase of apparatus and supplies necessary for several specific investigations, having met with an encouraging response from the President and the Board of Governors of the University, the first research work, carried out under the auspices of the School, commenced at the opening of the session, 1917-18.

Success Attained.

The success of the School at the outset was somewhat greater than usually attends a research movement in the first year of its organization. Although papers containing the results of the investigations constitute only one means which the success of a research movement may be estimated, yet this is an important criterion of its growth. Bulletin No. 1, with fourteen papers, containing the results of investigations in six departments of the faculty, appeared in the autumn of 1919, and was very favorably commented upon by numerous engineers, investigators, and scientific and educational bodies, among whom it was given a wide circulation. The establishing of the School was justified, and those actively engaged in its work were encouraged to still further expand its activities. Further researches were undertaken, requiring a greater number of research assistants, and more apparatus, the increased expenditures being generously met by larger appropriations by the Board of Governors. Bulletin No. 2, containing seventeen papers, has just appeared, and will be followed during the coming summer by Bulletin No. 3. The very favorable reviews of the papers of Bulletin No. 2, which have already appeared in the scientific journals, as well as the increasing number of requests for papers and bulletins, are very encouraging indications of the steady progress of the School. So great was this demand for separate papers from engineers and investigators in many parts of the world, that the editorial committee decided to publish subsequent bulletins in sections, each section containing a paper or group of papers dealing with a single problem or group of related problems, the main bulletin consisting of several of these sections bound together in a single volume.

Research Spirit.

However, it is not in the publication of papers alone that the effects of a University research movement are felt. Of equal importance is its influence upon the undergradu-

*From Transactions, University of Toronto Engineering Society.

ate. Contact with a larger number of graduate students and members of the staff, who are carrying on research work, will more quickly develop the desirable point of view of the investigator, who reads the current literature of his science, and the original sources of information, rather than text books, which often have a tone of finality, and thus tend to leave the impression of science as a finished product, instead of as an organism undergoing constant change and growth. Thus, the undergraduate will be induced to develop his knowledge of the principles and laboratory technique of his science, so that he also may play a part, either in extending the bounds of knowledge, or in assisting in its applications to industry. The importance of this reaction of the School of Engineering Research upon and undergraduate, which will be more and more apparent as the School develops, can scarcely be overestimated. It is just this investigating quality which characterizes a university, and distinguishes it from a high school. A university is not a hopper through which huge masses of pre-digested facts are poured into students' heads.

This research movement has had a very encouraging and promising beginning. It has met with a considerably greater measure of success than is usual with new research organizations. That it may continue to grow, until it comes to occupy a position in the life of the university and the State, comparable with that attained by the long established and justly celebrated laboratories of older countries, should be the earnest desire of all the students, graduates, staff and friends of The Faculty of Applied Science.

INSPECTION OF STRUCTURAL STEEL*

INSPECTION as ordinarily provided for in specifications is a form of insurance. Its object is to ensure the performance of the specifications in all details so that the purchaser will receive that which the manufacturer contracted to deliver.

The inspection of structural steel with which this article is specially concerned may be classified into the inspection of: (a) Materials; (b) Workmanship; (c) Dimensions; (d) Erection.

Inspection of Materials.

Inspection of materials covers all the processes of manufacture as well as inspection of the finished product. In all but exceptional cases it is sufficient in the inspection of steel for structural purposes to confine the inspection of the material to an examination of the finished product. This includes testing samples of the steel to determine if the chemical and physical properties are correct. In the surface examination of the steel defects such as slivers, cracks and blisters are noted and where they are of a serious nature, they are cause for the rejection of the pieces in which they occur.

Rusted surfaces are also examined and the Inspector has to distinguish between surface rust, which can be removed with a wire brush, and pitting which is more serious, and which is usually a cause for discarding the material.

Inspection of Workmanship.

Under this heading come the various operations carried out in the shop, the most important of which are shearing, punching, reaming, fitting and riveting. It is the duty of the Inspector to see that these are properly carried out without damage to the steel and in accordance with the specifications.

There are some points about which the Inspector has to be particularly alert. In shearing, care should be taken to see that the distance from the centre of rivet holes to the edge of the plate is not less than the minimum distance required by the specifications. In punching, the centering of rivet holes should be watched. In reaming, care should be taken to see that the drills are inserted at right angles

to the axis of the member being drilled. In fitting, all burrs should be removed from the edge of the rivet holes and the pieces drawn together and bolted tightly with sufficient bolts to keep them in close contact while they are being riveted.

Careful attention should be given to the matching of the holes when two or more pieces are to be riveted together. If the matching of the holes is not good, it may be corrected, where the conditions will allow, by reaming the holes to a larger diameter and using a rivet of corresponding size.

In riveting, the inspector must see that the rivets are tight and have properly formed concentric heads. Strict attention should be given to the dies and all worn dies should be discarded. Close watch should be kept on the compressor gauge to see that sufficient pressure is being supplied to the riveting machines.

There are other operations, perhaps not quite so important as those we have already mentioned, to which attention must be given. Among them are chipping, counter-sinking, grinding and milling.

Dimensions.

The inspector is not only responsible for workmanship but it is his duty to see that the fabricated pieces conform to the drawings in every detail. The sizes of the sections composing the member, the overall length, the spacing of the rivets and other dimensions have to be checked up. Particular attention is paid to the open holes for field connections and to all governing dimensions such as the height of brackets on columns and the distance from the end of a beam to the point where other beams frame in. In structural steel designing, certain combinations of members occur frequently and the designs of these are usually standardized. These standards are different for various shops and thus it becomes necessary for an inspector to familiarize himself with the practice of each shop. Standards are usually available in blue print form from the drawing office.

Erection.

The field inspector takes the fabricated steel and sees that it is erected to form the structure desired. Inspection of the assembly of the parts and the riveting, painting and other operations are part of his duties.

General Duties.

The inspector has other duties arising directly out of his position as representative of the purchaser. He is usually required to follow the progress of the work and to assist in getting the different parts of the work in the order required in the field. He has also to keep track of all extras on the contract and to check the weight of all fabricated material purchased on a pound price basis. He has also to make progress reports on the job from week to week to his principals.

The Commission maintains an inspection staff in the laboratories department which is charged with the duty of inspection as outlined above. During last year this department inspected upwards of 11,000 tons of structural steel made up into buildings, bridges, transmission towers, penstocks and tanks.

Announcement is made of the appointment of the Canadian Fairbanks-Morse Co., Ltd., Montreal and Toronto, as sole Canadian agents for the Austin Manufacturing Co's line of road-making and maintenance machinery. The Austin line includes: motor road rollers, steam road rollers, motor sweepers, street sweepers, street sprinklers, road oilers, road scarifiers, rock crushers, elevating graders, and reversible graders.

The Peterborough branch of the Engineering Institute of Canada and members of the Peterborough Utilities Commission paid a visit recently to the power plant at Raney Falls, which was built by the Hydro-Electric Power Commission of Ontario. The plant, which will be in operation some time this summer, will have a capacity of 10,000 h.p.

*From the Bulletin of the Hydro-Electric Power Commission of Ontario.

ARTISTIC DESIGN OF BRIDGES*

By Charles Evan Fowler

Chief Engineer, Detroit-Windsor Bridge; Consulting Engineer.

USE of the term "Architecture of Bridges," which is common enough, would seem to the writer to point to a misconception of the real problem. There is as yet no architecture of bridges and it is doubtful if there ever will be any system of hard and fast rules to govern their artistic design. There are, however, certain fundamental principles and certain elements of design which must be observed, if we are to arrive at a pleasing ensemble for any particular structure. The problem is much more simple if we are designing a stone arch bridge, or one of concrete, or one of reinforced concrete, than is the case when designing a steel span or series of such spans. However, there are certain basic principles that apply to any and every type of bridge.

Artistic Essentials.

Simplicity, Harmony, Symmetry and Proportion must be regarded in any design that would have any pretensions to beauty or artistic effect. They are the fundamentals of true architecture or artistic design, no matter what the structure may be to which thought is to be applied in its design.

Simplicity means first a truth-telling structure, no subterfuges about the lines of stress, no covering of a concrete structure with a stone facing, no frivolous or inappropriate details, but a strict adherence to the necessary features, whether they are to carry the loads or to ornament the bridge.

Harmony is essential to a pleasing or artistic design, for without it the structure would be distasteful. Harmony not only as between substructure and the superstructure; between the various spans; between the spans and approaches; between the utilitarian features and the ornamental details, but with the surroundings as well.

Symmetry may or may not be essential to a pleasing design, although it usually is necessary if a truly artistic structure is to result. Where the bridge has great length, unsymmetrical features are not so noticeable as in a shorter one, which may all be seen at a glance. As is often true in a landscape, balance must often be secured by including an unsymmetrical feature. That is, wherein one portion of a structure, a draw span or other unbalanced feature must be included that will destroy the symmetry, something must be introduced in another portion that will restore the balance, although symmetry does not result.

Proportion is necessary, that the three preceding principles may be realized, and usually, but not always, when the economical proportions have been determined, they are pleasing. However, in many cases modifications must be made to reach the point where economy and beauty can both be satisfied. Proportion of the details employed for ornamentation is quite another thing, and to be harmonious they must also be properly proportioned.

Examples may be seen in almost every structure of the proper application of some of these principles, but more often do we find most of them flagrantly violated. The remark made by C. Shaler Smith, the dean of American bridge engineers, to one of his assistants—"Most bridges are examples of what not to do"—must be remembered by anyone who wishes to attain to high rank in his profession. It is to be feared that in most cases we feel that, "in the long run, the average sense of the many is better for the many than the best sense of any one man." There is a right and a wrong; most engineers attain neither, in the hope they are right and the fear they are wrong.

Pleasing Ensemble Vital.

We need not care whether a detail is Byzantine, Greek, Roman, Gothic, or Renaissance if it is of the proper proportion,

portion, harmonizes with the other details, with the structure, and helps in forming an entirely pleasing ensemble. The Gothic arch was Persian before it was Gothic. Our structure may be similar to a work of architecture, in that it is neo-classic, but who would say that for this reason the Rathaus of Cologne, or the Hotel de Ville in Antwerp, are not good pieces of art?

The diagonals or latticing in a bridge are sometimes unpleasing, and at other times in some other structure, not unpleasing. They probably originated with the savage, who used vines or fibre to form diagonals for his primitive structures. The farmer of today still uses ropes or wire for similar purposes, but as yet diagonal bridge members, nor yet the garden trellis, have been accorded a niche among architectural styles. The engineer, for some scores of years, has calculated his diagonals, and used them in his design because he believed they were necessary, no matter how incongruous they appeared. Now we know how to provide for secondary stresses and can often omit the diagonals whenever a more pleasing structure will result.

Ornamentation.

The curved lines of the suspension bridge and of the arch are inherently beautiful, and simplicity is best illustrated in its pleasantest features in bridges of this type with no decorations or embellishments of any kind. However, we must not overlook the fact that even a chaste design may be much improved in appearance by the use or addition of appropriate and harmonious details or decorations. The suspension bridge seems sadly designed where the towers are not properly completed by a parapet or attic storey for those of stone, and perhaps crestings for those of steel. The arch is made more beautiful by molded work in the arch ring, by the use of appropriate medallions at the key stone, by the careful embellishment of the spandrels or spandrel arches, and lastly by the use of well designed and ornamental parapets and parapet railings.

Harmony is best exhibited where no part of a structure or of its decorations seem to be extraneous, and where the structure harmonizes with its surroundings. This latter feature is illustrated by the harmony of the battlemented towers of the Conway suspension bridge and the Conway tubular bridge, with Conway castle; by the harmony of the medieval towers of the London Tower Bridge with the Tower of London; and by the harmony of the stone towers of the old Brooklyn bridge with the high buildings of New York City, although this is but a happy accident, as the buildings were the later development.

Symmetry.

Symmetry in its simplest form is where one-half of the structure is exactly like the other half, where one approach is like the one at the other end of the bridge. That is where the structure is perfectly balanced in the simplest manner. The most pleasing design is where the centre of the bridge is at the centre of the middle span, or it may be stated as a fundamental principle that an artistic bridge must have an unequal number of spans—one, three, five, or seven in number; but beyond seven spans the eye does not so readily grasp the whole and seek for an opening instead of a pier at the centre. Likewise the spandrel arches of an arch bridge must be three, five, or seven in each half of the span, or where they extend across the key stone, an unequal number for the whole span.

Proportion is most nearly reached when the whole structure is most pleasing to the trained eye, and the truth most closely adhered to in every part of the structure and in every detail. The use of too great a sag in a suspension bridge, or of too great a rise in an arch bridge dwarfs the apparent length of such a span. That is, too great for appearance, even if not too great for economy.

Careful Study Needed.

We must remember that there is nothing really in common between the architecture of buildings and the artistic design of bridges. The lack of any attempt at artistic

*From an address delivered before the Civil Club, University of Toronto.

design in the Williamsburg suspension bridge is deplorable; the failure to complete the towers of the Brooklyn Bridge is deplorable; the attempt at an artistic design for the Manhattan bridge produced a structure which is only not unpleasing; but in the Hell Gate arch we have a structure which is of great simplicity, of real harmony, of true symmetry, and perfect in proportion. It is not often given to man or to the engineer, to attain nearly to perfection, seldom more than once; but by careful study and thought, we can obviate very many flagrant violations of the artistic in the design of our bridge structures.

SUBURBAN PROBLEM OF GREATER WINNIPEG

Evils Following Boom Subdivisions — Heavy Tax Burden For Local Improvements and Schools in Suburban Municipalities — Zoning and Greater Winnipeg Plan Advocated.

SUBURBAN problems of large cities with particular reference to Winnipeg were discussed in an Informing address by W. E. Hobbs, Comptroller of Town Planning, Province of Manitoba, at the recent annual meeting of the Town Planning Institute of Canada, in Ottawa. The address, in which considerable detail was given, both in the nature of figures and plans, is abstracted briefly below.

Mr. Hobbs pointed out the difficulty hampering the proper development of Winnipeg through the original layout of lots and streets. The narrow "River Lots" and their extension into "Lots in the Outer Two Miles" running roughly at right angles to the Red and the Assiniboine Rivers have governed the city plan to an unfortunate extent. As a consequence straight streets 50 ft. wide and two to four miles in length have become the rule in Winnipeg and the surrounding district, with lanes 16 ft. wide midway between them, and lots 99 ft. deep fronting on them regardless of the function which streets, lanes or lots expected to fulfil.

Except in the case of St. Boniface, the development of suburban municipalities adjacent to Winnipeg was slow until after 1905. In the period from 1912 to 1915 there was a particularly rapid growth in the suburban municipalities.

Boom Subdivisions.

In the period from 1910 to 1914 an amount of suburban land was converted into building lots far in excess of the present or future requirements of the population for many decades to come. The result is that only a small percentage of suburban municipalities are built up, in the case of the rural municipality of Fort Garry amounting to only 0.45%, and in the case of St. James, the most built up of these municipalities, amounting to only 6.8%. Of the area of Winnipeg proper only 41.3% is built up. These figures were established by Mr. Hobbs by assuming a population of 32 persons to the acre on the built-up portion and determining the percentage of area that would need to be occupied by the 1921 population.

During the years of unrestricted subdivision, lots and streets were laid out without regard to the uses to which they were to be put. The relative functions of main and secondary highways received no consideration; lands that might have become attractive residential areas were spoiled for that purpose and those that should have been set aside for industrial purposes were given over to other uses. No parks or recreation grounds were appropriated or apparently ever given a passing thought. Unfortunately, a sufficient number of these lots have been built upon to fix the form of the layout so that it is not difficult to secure a more advantageous arrangement except in cases of urgent necessity.

Lower prices of land and lower initial taxes naturally drew people from the city to the suburban municipalities. In most cases those who moved out were people of small or very moderate means. Back from the main highways, often a mile or more, land of apparently little residential

value was sold at a price enabling the poorest people to buy it, so that the development has naturally been widely scattered.

Increase In Suburban Taxation.

Since 1915, when the period of depression really set in, the saleability of suburban lots has diminished, while municipal taxes have increased enormously. Added to the effect of the war, were the costs of numerous local improvements such as sewers, water supply, etc. To lessen the burden of taxation some municipalities have made efforts to increase their population, but with indifferent results.

In a typical suburban municipality cited by Mr. Hobbs, there were in 1921 only 6,396 people while at the same time there were nearly 27,000 building lots, an excess of nearly 25,000 lots. When farm lands are withdrawn from production to be subdivided into building lots that are not required, an economic loss results. Soon the tax burden becomes so great that many of the lots are allowed to revert to the municipality through tax sale proceedings. This is particularly true for the poorer lands, and the municipality finds itself saddled with a great many unsaleable building lots against which no taxes can be levied. Where there are local improvements charged against lots they have to be met out of the general revenue. This situation was largely the cause of the town of Transcona being placed in the hands of an administrator some two years ago.

Local Improvement Burden.

Even though development of suburban areas may be highly scattered, it is necessary where a considerable number of houses are grouped together to provide water and sanitary conveniences. To connect these outlying areas may involve the construction of half a mile or more of entirely unproductive sewers or water mains which have to be charged up against the lands affected. If, as was pointed out by Mr. Hobbs, development were regulated, it would not be necessary to provide roads, sidewalks, sewers, and water mains capable of serving fifty or more houses for the benefit of possibly three or four.

School Tax Problem.

Experience has shown, stated Mr. Hobbs, that in the municipality cited, the tax increase is due more to the cost of operating schools than to the other matters mentioned. As school taxes are paid on vacant lands as well as on buildings, the average value of new dwellings must be great enough to produce revenue for school purposes equal to the increase in school expenditures caused by the children living in them if the school rate is to remain the same. In the particular community mentioned as an example by Mr. Hobbs, it was found that while the average additional revenue realized by the construction of each new house was \$27, the increased school expenditure arising from the necessity of providing school accommodation for the normal percentage of children was found to be \$75.50. In another case, each new house produced on an average \$13 for school purposes, whereas the increased expenditure involved was approximately \$76.

To meet the heavy burden of the cost of schools the municipal financier counts to some extent on the construction of the more expensive buildings. Costly dwellings and industrial buildings bear a share of taxation in excess of that required for school purposes, so that a municipality naturally should attempt to attract the well-to-do to live within its boundaries, and, in so far as possible, to encourage the establishment of industries. Unfortunately, suburban municipalities are not self-contained, the larger business or industrial buildings being located in the city proper, so that unless a suburban municipality contains a larger number of expensive residences, it has difficulty in meeting school expenditure without a heavy tax rate.

Zoning As a Remedy.

Mr. Hobbs advocated zoning as a partial remedy for the ills suffered by Winnipeg as a result of unfortunate and

unregulated development. Farm and garden lands should be declared an arable zone so that municipal taxes on such land could be reduced and they could be used for the purpose at which they are at present best suited. Residential zones should be set up and commercial and industrial requirements should be met by the establishment of zones for them. Regulations should be established governing all future subdivisions, so framed as to bring the cost to the community of its development to the lowest possible level. One municipality has already adopted regulations requiring that in the case of a proposed subdivision, if the municipality cannot see its way to instal sewer and water facilities forthwith, it will not approve of the subdivision, unless the applicant will provide these facilities at his own expense. If he is not willing to do this, he may subdivide his land into lots sufficiently large to insure healthful conditions without the provision of sewer and water facilities, in which event a restriction of one house to a lot would be imposed.

Greater Winnipeg Plan.

The need for a Greater Winnipeg plan embracing the city and suburban municipalities was pointed out by Mr. Hobbs. The need for preventing the construction of a ring of factories around the city is one of the urgent features of the situation, as is also the desirability of insuring the best use for residential purposes of areas suitable for such.

HILGER CHEMICAL SPECTROMETER.

AN entirely novel spectrometer designed for chemical analysis, called the Hilger chemical spectrometer, has been placed on the market by Adam Hilger, Ltd., 75A Camden Road, London, N.W., England. Although the spectroscope has been known from the time of Kirschhoff and Bunsen, and has been in use by chemists ever since, it is not yet in daily use in most chemical laboratories. Various reasons for this can be enumerated, such as initial cost of the equipment, the large space required to instal it, the want of an agreed and convenient technique connected with the production of emission spectra, the need of calibration, and, finally, the absence of suitable tables giving the wave-lengths of the lines characteristic of elements. In designing the Hilger spectrometer, these points have been borne in mind, and as a result, an instrument has been produced which is not only substantially cheaper than this company's constant deviation wave-length spectrometer, but is also compact, taking up less table space, and convenient to manipulate. Another feature is that the readings are direct in wave-lengths, to an average accuracy of 0.15 micro-millimetres (1.5 Angstrom units.)

HAMILTON ENGINEERS ELECT OFFICERS.

ELECTION of officers at a recent meeting of the Hamilton Branch of the Engineering Institute of Canada resulted as follows: Hon. chairman, H. U. Hart; past chairman, E. H. Darling; chairman, F. W. Paulin; vice-chairman, J. W. Tyrrell; secretary-treasurer, W. F. McLaren; Committee, H. G. Bertram, J. J. Mackay, P. M. Smith, C. H. Marrs, ex-officio, E. R. Gray.

The secretary, W. F. McLaren reported that the membership of the branch had increased from 160 to 170 and that the finances were in good shape. During the year nine meetings were held and addresses delivered by prominent engineers on live topics.

At the annual meeting of the Nova Scotia Mining Society, held at Sydney, N.S., on May 29, the following officers were elected: George D. MacDougall, president; C. M. O'Dell, first vice-president; A. S. MacNeill, second vice-president, and E. C. Hanrahan, secretary-treasurer.

HUMPBACK RESERVOIR OVERFLOW COMPLETED

CONSTRUCTION of the Humpback reservoir overflow, estimated to cost the city of Victoria, B.C., about \$18,000 is practically completed. The project has been under way since January, and most of the work was done in the form of relief by men who applied to the city for employment.

The steel pipe section of the overflow will form when completed the longest homogeneous section of steel pipe on the Island, being without calked or bolted joints, all connections being made by welding. The main flow lines through which Victoria's water supply flows, are of concrete. The total length of steel used in the overflow is 1,960 ft. The entire length of pipe is buried to a depth of about 3 ft. to the top of the pipe. This is necessary owing to there being no provision for expansion of joints. The method of construction adopted was to fabricate the pipe in the shops in 20 ft. lengths. All welding was done by the oxy-acetylene process.

DIAGONAL TRAFFIC ARTERY AT OTTAWA

OTTAWA in its layout — its mesh of streets — suffers as all other Canadian and American cities from the over-expansion of the checker-board system and its resultant indirection between most of the important objectives.

York St. in Lower Town extends for four blocks and through the market area from Sussex St. easterly with a convenient width for its purpose of 132 ft. to King Edward Ave. Beyond King Edward Ave. it is proposed to continue it on a similar width for some distance and then gradually diminish the width to 80 ft. for the last 500 ft. approaching St. Patrick St. Bridge. The proposed widening and extension as a diagonal will provide a direct access for heavy and market traffic from East of the Rideau River to the

TRAFFIC DIAGONAL AT OTTAWA

market and the centre of the city. Moreover, the scheme will relieve the city of the otherwise inevitable widening of St. Patrick St. in a few years at many times the cost and disturbance. The new diagonal, which is over 3,000 ft. in length, disturbs few houses of any value and will remove many undesirable fire-trap structures and prove a valuable fire-break across the city.

Mr. Cauchon, the chairman of the Plan Commission, in a recent lecture in By Ward, strongly advised those affected to initiate action under local improvement by-law and reap the benefits of the improvements in traffic conditions and enhanced values which would follow. It is intended to have a square at the approach to the bridge that traffic may be segregated and directed without delay or confusion. The St. Patrick St. Bridge is one of the handsome new concrete bridges just completed across the Rideau River, by the works department of the city. The illustration shows the diagonal traffic artery proposed by the Plan Commission.

A recent compilation by the U. S. Bureau of Records, on the cost of various types of road pavement, covers 63 million square yards of paving constructed with Federal aid in all parts of the United States from 1916 to 1921. The following square yard costs of paving are average figures only: Sand-clay, 18c; gravel, 46c; plain and surface-treated macadam, 95c; bituminous macadam, \$2.10; bituminous concrete, \$2.50; plain cement concrete, \$2.57; reinforced cement concrete, \$2.74; and brick, \$4.10.

Engineer's Library

INDUSTRIAL LIGHTING BRIEFS—The Cooper Hewitt Co., Hoboken, N.J., are distributing from time to time a series of Industrial Lighting Briefs which contain interesting matter relative to the subjects of light and lighting. One of the more recent bulletins issued, deals with "Industrial Lighting in Theory and Practice."

THE CENTURY WOOD PRESERVING CO., Pittsburgh, Pa., Bulletin No. 21 which has just been issued by this company contains some interesting information on the adzing and boring of cross ties before treatment. The adzing and boring of cross ties before treatment has been practiced in Europe for some years, but it is only within the last few years that this practice has been adopted on this side of the water. The bulletin is nicely illustrated and will be found of interest to all those who are concerned with the maintenance of railroads.

SOUND PROOF PARTITIONS.—By F. R. Watson, Professor of Experimental Physics, University of Illinois. Bulletin No. 127, Engineering Experiment Station, University of Illinois, Urbana, Ill. Paper: 6 by 9 in.; pp. 78; illustrated. The bulletin is the outcome of an effort to discover ways and means of producing quiet rooms in hospitals, hotels, office buildings, music studios and the like. Much valuable information is collected and presented in a systematic way giving the methods and results of various investigations relating to the actions of materials with respect to the transmission of sound.

THE PORTABLE MACHINE CO., OF PASSAIC, N.J., has just issued an interesting folder illustrating and describing the contractor type of scoop conveyor, which is particularly adapted to the construction of concrete roads. This new machine is designed particularly for the handling of crushed stone, sand and gravel, and is based upon the results of actual experience which the company had in the manufacture of portable belt conveyors for many different operating conditions. Those interested in the design, construction and maintenance of roads will find the leaflet exceptionally interesting and a copy can be had for the asking.

THE DESIGN AND CONSTRUCTION OF DAMS, including masonry, earth, rock-fill, timber, and steel structures; also the principal types of movable dams.—By Edward Wegmann, New York, John Wiley & Sons, Inc.; London, Chapman & Hall, Ltd. Seventh edition; pp. 555, 210 figures; 16 folding plates; 9 by 11½ in.; cloth; \$10 postpaid.

Thirty-four years have passed since the first edition of this book—a treatise of 106 pages, discussing only the subject of masonry dams—was published. Only trifling additions were made in the second and third editions, but in the fourth, which appeared in 1899, the scope of the book was enlarged so as to include the design and construction of masonry, earth, rock-fill, timber and steel dams, and, also, the principal types of movable dams.

In the fifth edition, published in 1907, the subjects of dams of reinforced concrete, rolling dams and Stoney gates were added to the book, and in the sixth edition the volume was enlarged so as to include two new chapters: One on overflow weirs and the other on coffer-dams, besides descriptions of recent dams.

So many important dams have been built of late years, in various parts of the world, and so much new information has been published about dams of all kinds, that a new edition of this book became necessary. It in-

cludes a new chapter on "Crest-gates and Siphon Spillways," important subjects about which very little has hitherto been published, and also additional descriptions of recent dams, and bibliography to bring the book up to date.

Among the subjects of interest included in this edition may be mentioned:

A full description of the construction of the Kensico Dam, New York, which has surpassed all previous records in the rate of progress; the movable dams of the N. Y. State Barge Canal; high dams built recently in Spain, one of which, the Camarasa dam, about 335 feet high above its lowest rock foundation, is at present the highest gravity dam in the world; automatic crest-gates of the hinged-leaf type, some of them 88.6 feet wide by 21.6 feet high; and siphon spillways, built both in America and abroad. To the sixth edition, which was published in 1911, have now been added about 50 pages of text, 34 figures in the text, and 5 plates. The new matter included in the present edition will prove to be of interest and value to engineers and contractors.

DICTIONARY OF APPLIED PHYSICS.—Edited under the supervision of Sir Richard Glazebrook, K.C.B., F.R.S., and published by The MacMillan Company of Canada Ltd., Toronto. Five volumes. The first volume of this most important work is now ready for distribution in Canada and the succeeding volumes will appear at intervals of from two to three months. The volumes contain from 800 to 1000 pages each and have been arranged as far as possible in subjects, as follows:

Vol. I Mechanics, Engineering and Heat.

Vol. II Electricity.

Vol. III Meteorology, Metrology and Measuring Apparatus.

Vol. IV Optics, Sound and Radiology.

Vol. V Metallurgy and Aeronautics.

The arrangement in each volume is alphabetical but each subject is dealt with in a continuous article. In this Dictionary, the first attempt has been made to bring within the compass of a single work, the latest results of research and the most approved methods in all branches of the subject. It will prove invaluable to all manufacturers who are vitally concerned with the question of physics as applied to industry, which has become so important during the past few years. The experience of the War has enforced more strongly, the lessons thus taught and the importance of applied science is now universally admitted.

THRUST BEARINGS.—Catalogue C. 72 pages and cover, 6 by 9 in., 62 illustrations; issued and distributed free upon request by the Kingsbury Machine Works, 4320 Lackawanna St., Frankford, Philadelphia, Pa. This new issue of the Kingsbury catalogue has been entirely re-written and includes much new matter of considerable value to the users of thrust bearings and to engineers generally. The section of the catalogue that will be of particular interest to Canadian engineers is an illustrated description of the Kingsbury thrust bearings installed in the Queenston plant of the Hydro-Electric Power Commission of Ontario. Other interesting features are the announcement regarding standardization of dimensions of Kingsbury bearings, the guarantee regarding power or friction loss, the illustrated description of the combined vertical thrust and journal bearings, the illustrated description of the propeller thrust bearings, a valuable technical and mathematical discussion of actual power loss determinations and of standardization of power losses. The catalogue is illustrated with a large number of interesting views of power stations in the United States and Canada, sectional drawings of various types of bearings, and photographs of typical bearings. It also contains a considerable amount of practical as well as technical information regarding the selection, installation and operation of thrust bearings.

SPECIAL MOTIVE POWER FOR STEAM RAILWAYS.

NEW developments in combination motor and passenger cars for branch line steam railways are occurring with notable frequency. We have had occasion to mention from time to time the commendable pioneering spirit shown by the Canadian National Railways in adapting the gasoline motor and the storage battery to the propulsion of motor cars for its branch lines. A type of gasoline car in advance of those previously tried out is now under construction for the Trenton-Picton line. So popular was the gasoline car service on the Brockville-Westport line that when the car was taken off for overhauling, representations were made to have the service restored, and such is being done. Reports of operation of the storage battery cars between Bathurst and Campbellton on the Canadian National Railways are also encouraging. It is of interest to note also that the Greater Winnipeg Water District is establishing a gasoline motor car passenger service on the 92 miles between St. Boniface and Shoal Lake.

Experience appears to show that the railway motor car made up by merely putting a car body and a set of flanged wheels on a standard motor truck is not satisfactory. Such a car will not stand the service requirements and consequently a new type is being tried out with four axles giving groups of four wheels at each end. The double pair of rear wheels will, it is hoped, give sufficient traction to propel a car through a snow storm, or with ice on the rails. As operation under winter conditions has been one of the principal drawbacks to the extension of gasoline propulsion on branch lines in this country, the new developments will be looked upon with great interest by Canadian railway engineers.

AESTHETIC STANDARDS FOR BRIDGES.

FOUR artistic essentials in the design of bridges are laid down in the article by Charles Evan Fowler appearing elsewhere in this issue. That these are of fundamental application and importance cannot be doubted, and if a structure is designed with due regard to them it should go far towards satisfying the public taste. It is probably true that more aesthetic monstrosities in bridge work occur through ill-advised attempts at ornamentation than from any other cause. It is quite true, as the writer points out, that the historical origin of architectural details is not of itself an important factor, but at the same time care must be taken to ensure that the detail is suitable for the kind of construction in which it is used. It is, for example, not desirable to employ in a steel structure details that in their general lines wholly belong to masonry construction.

Nor is it permissible to mask a truss span with a false fascia construction simulating the lines of an arch.

Study of bridge design, good and bad, leads to the inevitable conclusion that the chief beauty arises from the general form and not from added ornamentation. A concrete arch span with a sharp break in grade at the crown is essentially displeasing, no matter what the surface treatment may be. No amount of attempted beautification can compensate for faulty lines, lack of symmetry or unbalanced proportions.

THE ENGINEER IN PUBLIC LIFE.

FREQUENT regrets are expressed in the technical press and in engineering circles, that the engineer does not take a more active part in public affairs. It is pointed out that when a public office is filled by election, it is generally a lawyer, merchant, banker or politician who is elected. In many cases, the particular post is such as to make it most desirable that an engineer should be selected to fill it, and nevertheless, there appear to be too few engineers who announce themselves as available for public office, or who seek preferment of this kind.

An interesting departure, calculated to encourage the entry of engineers into public life, is the publication by Engineering News-Record, of short biographical sketches of engineers who have recently been prominent in connection with non-professional activities. The object is to draw the attention of the profession to those of its members who have been selected as mayors, members of city councils, members of legislatures or chairman of important committees concerned with public or philanthropic undertakings. The step thus taken is a most commendable one and should have a salutary effect. The profession should know of all cases where its members have won distinction in fields not directly connected with technical work, and an extension of such activities is something that should be encouraged in every possible way.

PERSONALS

CAPT. F. P. STEERS has taken up his residence in London, Ont., to start on the 1922 section of the London Geodetic Survey.

GEORGE D. MACDOUGALL, chief engineer of the British Empire Steel Corporation, has been elected President of the Nova Scotia Mining Society.

GABRIEL HENRY, former chief engineer of the department of roads, Quebec, is now consulting engineer. M. NECKAR has been appointed to the position of chief engineer.

R. A. PARRISH is now general organizer and publicity agent of the Edmonton Automobile and Good Roads Association, having been appointed to this position, recently, for a three months term.

JOS. L. BOULANGER, former secretary to Hon. J. L. Perron, Quebec Minister of Roads, has been appointed deputy-minister of that department to succeed Ben. Michaud who has resigned owing to ill-health.

A. B. MANSON, city engineer of Stratford, Ont., recently observed the tenth anniversary of his appointment to that position. Mr. Manson entered the service of the city on June 1, 1912, coming from the Canadian Northern Railway.

E. T. CORKILL, mines superintendent for the International Nickel Corporation, Copper Cliff, Ont., has left Sudbury and will reside in Toronto. Mr. Corkill joined the staff of the company as safety engineer in 1913 and in 1918 was promoted to the position of mines superintendent.

H. JARDINE, of Hespeler, Ont., has been appointed assistant city engineer of Galt, Ont., filling the vacancy caused by the resignation of ROY PATERSON. Mr. Jardine is an honor graduate of Queen's University, and served overseas with the C.E.F. He was for a time assistant engineer for the town of Timmins, Ont.

W. H. BISCHOFF, who was recently appointed general superintendent of the Dominion Iron & Steel Co., has arrived in Sydney, N.S. Mr. Bischoff, who replaces the late H. E. Price, was formerly assistant general superintendent of the Dominion Iron & Steel Co., but left in 1919 to join the Lubin Iron & Steel Co., Coatesville, Pa.

NORMAN J. GOEBEL, formerly water works engineer at Oshawa, Ont., has joined the staff of Code & Code, consulting engineers, Windsor, Ont., and is in charge of the construction of asphalt pavements and water works extensions for the town of Kingsville, a summer resort on Lake Erie. This work involves the expenditure of approximately \$200,000.

ROSS L. DOBBIN, the newly elected chairman of the Canadian section of the American Water Works Association, was educated in the public and high schools of Peterboro, Ont., and graduated from the Faculty of Applied Science, Toronto University in 1910, with the degree of B.A.Sc.

After graduation Mr. Dobbin was employed for a short time at the works of the Dominion Bridge Co., Lachine, Que. as resident shop inspector for the Canadian Inspection Co.

In the fall of 1911 he went to Moose Jaw, Sask., as resident engineer for Walter J. Francis & Co., on the new water supply for that city. On the completion of that work he returned to Toronto in 1914 where he acted as erection inspector for the Dominion Inspection Co., on the steel work of the Royal Bank Building.

In June, 1914, he returned to Peterboro as waterworks superintendent for the Utilities Commission, and has remained in that position ever since. During that time he has supervised, among other things, the installation of a steam auxiliary pumping plant, and a six million gallon filter plant.

Mr. Dobbin is a member of Council, Engineering Institute of Canada, and also vice-chairman of the Peterboro branch of that body.

M. A. POOLER, who was recently appointed general manager of the New Brunswick Power Co., St. John, N.B., has had fifteen years' experience in the public utility field in the United States. He is a graduate engineer of Case School of Applied Science, Cleveland, Ohio, and Purdue

University, Lafayette, Indiana. After completing his engineering training, Mr. Pooler was engaged for several years with the Pennsylvania Ohio Power Co. For the past eight years Mr. Pooler has been general manager of the Potomac Public Service Co. Mr. Pooler has for many years been closely associated with the firm of Sanderson & Porter, of New York, which company will direct the management and operations of the New Brunswick Power Co.

S. E. REAUGH will survey and report on the proposed Jasper highway for the Edmonton Automobile and Good Roads Association. Mr. Reaugh has had much experience in his particular line of work. He was engineer in charge of location and construction of work on the Denver and Rio Grande Railway, and also on the Rio Grande Western. He held a similar position on the Colorado & Midland Railway. As an engineer under the Department of Railways and Canals of the Dominion Government, he had charge of two-thirds of the work on the Canadian National grade between Edmonton and British Columbia boundary, and when the rails were lifted, built the fifteen miles of road on the grade which is now in use from Lobstick Junction to Leaman. More recently he has been a resident engineer for the Alberta Provincial Government.

OBITUARIES

EDWARD BOTT, prominent builder and contractor of Toronto, died at his home in that city on June 3, aged 51.

ROBERT W. COX, civil engineer, died in Toronto on June 2, aged 46. The deceased who was a native of Lincoln, Nebraska, had resided in Toronto for 20 years.

JOSEPH H. OUELETTE, contractor of Sandwich, Ont., died in that town recently, aged 82. The deceased was born in Essex County and had lived in Sandwich nearly all his life.

SAMPSON J. BOTTOMLEY, contractor, died in Edmonton, Alta., recently aged 72. The deceased had lived in Edmonton about 12 years, having previously resided in Toronto.

CHARLES GARDEN, who died recently at St. John, N.B., aged 71, was in charge of work on different sections of the C.P.R. during the construction of that road through the Rocky Mountains. Mr. Garden was born at Woodstock, N.B.

BIG WATER WORKS CONVENTION 1923

AN important event for the border cities next year will be the annual convention of the American Water Works Association at Detroit and the meeting of the Canadian section A.W.W.A. at Windsor. It is planned to hold the Canadian convention a few days prior to that on the American side; both conventions being scheduled to take place early in June. By this arrangement Canadian water experts will have the added opportunity of attending the large American meeting in Detroit where they will be in a position to glean valuable data from the experience of a large number of prominent engineers who will attend the convention. Many problems dealing with the water supply of the Canadian Border Cities and Detroit will be discussed at next year's convention, where first hand engineering advice from the assembled experts of the continent will be available.

Commanding a party of British mining experts and backed by British capital, H. L. F. Blake, Ottawa, mining engineer, has set out for the wilds of Ungava, on a prospecting trip. His operations will centre on Lake Chibougamau, on the southern border of the territory, and his party will consist of four or five Brits and a dozen Indians of the Matanus tribe. Mr. Blake expects to stay in Ungava until October or November. He is a director of the Quebec and Chibougamau Railway, owned by British interests, and his present efforts pertain to the interests of the railway.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand or proposed, contracts awarded, changes in staffs, etc.

TENDERS PENDING

The following tabulation is presented as a reminder to contractors in regard to tenders that are still pending, other than those reported in this issue. The word "Issue" refers to the issue of "Canadian Engineer" in which there appeared a notice giving details regarding the call for tenders.

Place of Work	Tenders Close	Issue
Nassau, New Providence, Bahamas, dredging	July 15	May 9
Revelstoke, B.C., construction of bridge	Jun. 19	May 23
Revelstoke, B.C., substructure of bridge	Jun. 19	May 30
Oakville, Ont., additions and alterations to Methodist Church Sunday School	Jun. 15	May 30
Ottawa, Ont., construction of female help building, Ottawa Civic Hospital	Jun. 15	May 30
Toronto, Ont., construction of concrete structures	Jun. 14	May 30
Saskatchewan, Province of, concrete bridges	Jun. 19	Jun. 6
Thorold, Ont., supply of cast iron water pipe and special valves and valve boxes, hydrants and for trenching	Jun. 15	Jun. 6
Kinloss Tp., Ont., construction of Ross Drain	Jun. 15	Jun. 6
Montreal, Que., work on wharves and pier	Jun. 15	Jun. 6
Halifax, N.S., construction of Halifax-Amherst Road	Jun. 20	Jun. 6
Malahide Tp., Ont., erection of steel bridge	Jun. 15	Jun. 6
Quebec, Province of, construction of road from Quebec to Ste. Anne de Beaupre	Jun. 23	Jun. 6
Quebec, Province of, construction of oiled waterbound macadam on a number of roads	Jun. 27	Jun. 6
Saskatchewan, Province of, construction of earth road from Canora west six miles	Jun. 21	Jun. 6
Sullivan & Elderslie Tps., Ont., construction of steel bridge, abutments and floor	Jun. 15	Jun. 6
Vaughan Tp., Ont., construction of reinforced concrete truss bridge	Jun. 17	Jun. 6
Chippawa, Ont., construction of concrete sidewalks and street crossings	Jun. 20	Jun. 6
Colborne, Ont., construction of High School	Jun. 14	Jun. 6
Kitchener, Ont., construction of Collegiate Institute and Vocational School	Jun. 15	Jun. 6
Lachine, Que., supply of transformers, oil switches, switch board panels, etc.	Jun. 15	Jun. 6
Oakville, Ont., laying of cast iron suction pipe, constructing extension to pump house and furnishing and erecting gasoline or oil engines, turbine pumps and electric generator	Jun. 22	Jun. 6
Port Credit, Ont., construction of addition to school	Jun. 15	Jun. 6

BRIDGES, ROADS AND STREETS

Brant Tp., Ont.—Contracts for construction of bridge over the Saugeen River on 6th Concession Road for Bruce County Council have been awarded as follows: Steelwork to the Hunter Bridge & Boiler Co., of Kincardine; concrete work to Jacob Palin, of Mildmay. Total cost, about \$22,000. Fred B. James, of Walkerton, is consulting engineer in charge of this work.

British Columbia, Province of.—Thirty-seven miles of road are to be constructed between Avola and Blue River. work.

British Columbia, Province of.—Contract for construction of Nelson-Ymir Road has been awarded by the Public Works Department to DeWolf and Ham, of Cranbrook, B.C.

British Columbia, Province of.—Tenders will be received by the Honorable the Minister of Public Works, Victoria, until noon, Monday, June 19, for the erection of two 60-ft. span King trusses in Lulu Island Bridge, Eburne. Plans and specifications may be seen at the office of Government Agent, Vancouver; District Engineer, New Westminster; and the Department of Public Works, Victoria.

Birch Cliff, Ont.—Suggestions will be offered at the next meeting of the council for the immediate widening of Kingston road from Stop 12 to the new Danforth extension at Stop 24, and more especially between the present congested area of Stop 18 to 20.

British Columbia, Province of.—Highway Department plans to improve the Hastings-Barnet Road. Chief Engineer, P. Philip, Victoria.

Dereham Tp., Ont.—Tenders closed June 12 for construction of five reinforced concrete bridges. J. D. Flanders, Township Road Supt., Dereham Centre, Ont.

East Nissouri Tp.—Tenders for abutments for bridges at Lot 35, Townline, between East Nissouri and West Zorra Townships, according to plans and specifications prepared by F. J. Ure, C. E., Woodstock, Ont., will be received until 12 o'clock, June 17.

East Nissouri Tp., Ont.—Tenders for building a concrete bridge at Lot 5, Concession 8, will be received until June 29. Plans and specifications may be seen at S. Tye's place, Lot 16, Con. 9, Clerk, J. W. Sutherland, Lakeside, Ont.

Etobicoke Tp., Ont.—Tenders closed June 5 for construction of concrete sidewalks on Douglas Ave. and Queen St., and grading on Queen St. Township Engineer, Frank Barber, Toronto.

Fencelon Falls, Ont.—A concrete pavement is to be constructed on Colborne St. and on Lindsay St. Clerk, E. Fitzgerald.

Hamilton, Ont.—Wentworth County Council awarded contract for concrete pavement on Binbrook Road to the King Engineering & Construction Co., of which W. W. King, of Oakville, is General Manager.

Islington, Ont.—Contracts for grading and construction of sidewalks on Queen and Douglas Streets were awarded to A. Johnson.

Knowlton, Que.—Contract for construction of iron bridge between the Townships of Sutton and Brome has been awarded to C. J. Dryden Co., Ltd., Montreal, for \$5,250. Tenders were also received from K. B. Jenckes, Sherbrooke, and Albert & Edouard Cote, Johnville, Que.

London, Ont.—Street Railway Co. is being urged by the city to pave its portion of certain streets on which there are street railway lines.

London, Ont.—Manager Buchanan of the Utilities Commission, has requested that City Engineer H. A. Brazier

construct a road in Springbank Park for the Commission.

Madahide Tp., Ont.—Tenders addressed to James A. Bell & Son, Civil Engineers, Court House, St. Thomas, Ont., will be received until noon, June 15, for furnishing material and erecting a 300-ft. steel bridge on concrete foundations over Stalter's Gulley, Nova Scotia St. Plans and specifications may be seen at office of engineers.

Mimico, Ont.—Town Council awarded contract to E. C. Hoffman for road work on Superior Ave., Robert Street and Eastbourne Ave.

Montreal, Que.—Director of Public Works has called for estimate of cost on paving rear lanes in city. Ald. Brodeur announced that a start would be made on the work this season.

Montreal, Que.—City Council let following contracts for supply of road oil: Sun Co., 60,000 gallons at 8½c. per gal.; The Barrett Co., Ltd., 90,000 gallons to be supplied and also laid for 16c. per gal.; and J. F. R. Leduc, 45,000 gallons to be supplied and laid for 16c. per gal.

Mosside, Alta.—Council decided to purchase four new road graders.

Normandy Tp., Ont.—Contract for construction of three girder bridges has been awarded to the Stratford Bridge Co., Stratford, for \$4,630.

North Oxford Tp., Ont.—Contract for grade in connection with erection of bridge was awarded to Geo. Wilks, Woodstock, at \$1,500, and for the abutments to Frank Fogarty, Ingersoll, at \$1,615.

Ontario, Province of.—A provincial highway is to be built from Port Erie to Port Colborne connecting with the concrete highway to Welland.

Ontario, Province of.—J. J. McNab, Trenton, was recently awarded the contract for the construction of all culverts on the Provincial highway in Prince Edward county, between Belleville and Picton. The amount of the contract is about \$18,000.

Ontario, Province of.—Highway Dept. is calling for tenders for the paving of a 20-ft. strip of roadway on the west side of the radial tracks on Yonge St., Toronto, from the Mausoleum to the southern end of the paved stretch at Newmarket.

Paris, Ont.—The estimated expenditures for this year include the following items: Street oiling, \$2,000; streets, roads and bridges, \$7,000; and concrete walks, \$500. Clerk, C. B. Barker.

Peterboro, Ont.—Board of Works tabulated a list of proposed repairs and improvements on streets which they sent on to Council for approval. City Engineer, R. H. Parsons.

Petrolia, Ont.—Hon. F. C. Biggs, Minister of Provincial Public Works and Highways, will be asked to designate the county road from a point south of Rutherford to Reece's Corners in Plympton Township, a provincial highway.

Point Grey, B.C.—Tenders closed June 6 for construction of concrete sidewalks. Henry Floyd, Municipal Clerk, Kerrisdale, B. C.

Quebec, Province of.—Orders have been issued by the Highway Department providing for the immediate repair of roads in the vicinity of Quebec, including Lake St. Charles, Lake Beauport and Loretteville Roads. Minister of Highways, Hon. J. L. Perron.

Quebec, Province of.—Urging the construction of a Provincial highway from Quebec to Chicoutimi, a delegation including all the mayors of the parishes of that section, headed by Hon. Emile Moreau, waited on Premier Taschereau and fully explained the project. The road would be 150 miles long.

Quebec, Province of.—Contracts for construction of roads awarded by Highways Department as follows: Montreal-Sherbrooke Highway, Oxford Township, 3 miles, to C. Gauthier, Weedon. Rock Forest, 9½ miles to C. Gauthier; Lake, F. Larouche, Coaticook, Magog Township; Rousseau & Guertin, Dastinan & Sheffers Township, 12 miles, Nova Scotia Construction Co.; Waterloo (Town), 9 miles, Nova Scotia Construction Co.; St. Cesaire, parish and vil-

lage, Montreal Road Construction Co. Levis-St. Laurent-St. Lambert-Sorel section, Varenne, 3 miles, J. Trudeau, Varrennes; Vercheres, 3½ miles, Napoleon Trudel, Contrecoeur, 11 miles, H. St. George, Huntingdon; St. Roch, St. Ours. Ste. Victorie and St. Pierre de Sorel, 12 miles awarded to Compagnie de Construction de St. Ours. Contracts for repairs have been awarded to O'Connor Bros. for all roads in Chateauguay, Beauharnois, Huntingdon and La Prairie counties.

Quebec, Que.—Following contracts were awarded by Board of Works for construction of pavement: T. I. Bilo-deau, St. Marie St., concrete, \$2.11 per sq. yd.; Marchand St., granite blocks, \$5.89; Turnbull Ave., granite blocks, \$5.89; Deligny St., concrete, \$2.11; D'Artigny, concrete, \$2.11; Q. A. A. St., concrete, \$2.14; Dosquet St., concrete, \$1.89. To Dominion Paving Co., Belvedere Road, warrenite, \$3.74; Garneau St., warrenite, \$2.30; Herbert St., warrenite, \$2.36; St. Monique, warrenite, \$2.30; Laval St., warrenite, \$2.30. To Madden & Murphy, Des Fosses St., asphalt, \$2.90; Fleurie St., asphalt, \$3.47; Charest St., asphalt, \$3.47; St. Francois St., asphalt, \$2.75; Bayard St., asphalt, \$3.55; St. Ambrose St., asphalt, \$3.50; Falardeau St., asphalt, \$3.50; Jumonville St., asphalt, \$3.52; Carillon St., asphalt, \$3.52; Ste. Therese St., asphalt, \$3.52; Third St., asphalt, \$3.52. To T. Rousseau, 13th St., concrete, \$2.20; Sixth St., concrete, \$2.20; Royal Rouillon, concrete, \$2.24; Bougainville Ave., concrete, \$2.48; Rac Amadou St., concrete, \$2.24. To A. Demers, Laurier Ave., concrete, \$2.

Riverside, Ont.—Contract for construction of concrete sidewalk on Lauzon Road awarded to Carlottie Bros., Walkerville.

St. John, N.B.—It is proposed to extend Millidgeville Ave. to the river.

St. John, N.B.—Contract for supply of 20,000 granite blocks was awarded by Common Council to the Granite Street Paving & Construction Co., at \$80 a thousand. Other tenders received: Morrison & Newlands, at \$85 per thousand and B. Mooney & Sons, Ltd., at \$85 per thousand.

St. Lambert, Que.—Work is to be started soon on a bitulithic surface for Front St. and the River Road as far as the limits of St. Lambert, while the 1,700 ft. of unimproved surface in Montreal South is also to be reconstructed.

St. Mary's, Ont.—A. Devincy and E. Dunseith have secured a contract for the construction of a section of the Provincial highway between Ingersoll and Woodstock.

St. Thomas, Ont.—Construction of an asphalt pavement on Wellington St. from Ross to Elgin Sts., is planned City Engineer, W. C. Miller.

St. Thomas, Ont.—Construction work on proposed ravine driveway is to be started from the Hiawatha Street entrance shortly. City Engineer, W. C. Miller.

St. Thomas, Ont.—City Contract awarded contract to William Irwin & Son for construction of 6,000 sq. yds. of bituminous macadam roadway at \$2.02 per sq. yd. The same firm was also given contract for constructing curbs and gutters and concrete sidewalks in connection with the streets, their prices being as follows: Curbs and gutters, 80c per ft.; gutters, 43c and sidewalks, 21c. E. P. Cash was the only other contractor who tendered. His quotation on bituminous macadam roadway was \$2.30 per sq. yd.; curbs and gutters, 90c; gutters, 42c; sidewalks 22½c.

Saanich, B. C.—Council authorized paving of 1,000 ft. of Tyndall Ave. Clerk, H. S. Cowper.

Sandwich, Ont.—Hydro-Electric Power Commission of Ontario plans to grade the road between the car tracks on London St.

Saskatchewan, Province of.—Highways Department will build road leading into Plapot.

Saskatchewan, Province of.—Contract for construction of road from the N. E. corner of Section 36, Township 33, range 12, west of the 2nd Meridian to Wadena has been awarded to The Christian Community of Universal Brotherhood, Ltd., of Veregin, Sask.

Saskatchewan, Province of.—Contracts for the construction of bridges totalling over \$12,000 were awarded by

the Highways Department, as follows: John Kenward Co., Regina, construction of two 60-ft. reinforced concrete suspended arches at Drinkwater, \$7,778.60, and a 40-ft. reinforced concrete beam span east of Maple Creek, \$2,901; Levi Angst, of Cypress River, Man., 20-ft. reinforced concrete beam span west of Yorkton, near Willowbank, \$2,072.

Sioux Lookout, Ont.—On June 14 by-law providing for the raising of \$10,000 for construction of bridge, grading, etc., will be submitted to ratepayers. Clerk, J. E. Cole.

Sydney, N.S.—Council awarded contract for construction of Argyle Street bridge to McNeil & Lamond, of Sydney Mines, for \$4,190. Other tenders received: R. V. Hall, \$5,652; A. E. Cunningham, \$4,580; F. A. Morley, \$4,745; Chappell's Ltd., \$4,684.

Thorold, Ont.—Tenders closed June 3 for construction of 3,000 sq. yds. of concrete pavement with combined curb on Chapel St. Engineer, F. N. Rutherford, 24 Queen St. St. Catharines, Ont.

Toronto, Ont.—Works Committee again recommended the widening of Jane St. in West Toronto to 86 ft. at a cost of \$80,000.

Toronto, Ont.—Lowest tenders received by Board of Control for three sections of paving on Lake Shore Road total \$143,802.

Toronto, Ont.—City Council intends to construct a concrete walk on Don Roadway, East side from Eastern Ave. to Queen St., at a cost of \$2,910.

Toronto, Ont.—The proposal for a subway under the G.T.R. tracks at Ashdale Ave. was again presented to the Works Committee after being laid over for a year.

Toronto, Ont.—Board of Education has asked the Works Committee to construct sidewalks on Haig Ave., south of Coxwell Ave., in connection with the Earl Haig School.

Toronto, Ont.—City Council intends to construct asphalt pavement on Annette St., at cost of \$65,530; concrete curbing on Annette St., \$2,911; and concrete sidewalk on Knox Ave., \$639.

Toronto, Ont.—Board of Control requested Works Commissioner Harris to report as to the advisability and probable cost of extending Avenue Road to the northern limits of the city.

Toronto, Ont.—Works Commissioner Harris reported to the Board of Control that the tenders received for the construction of the new bridge over the Don at Gerrard St. are unsatisfactory, the prices quoted being too high.

Toronto, Ont.—Following contracts were awarded for construction of asphalt pavements: Oriole Gardens, Kilmer & Barber, \$7,128; Lake Shore Road, 3 sections: Constructing & Paving Co. \$41,193; Godson Contracting Co., \$61,866; Kilmer & Barber, \$40,743.

Toronto, Ont.—Works Commissioner R. C. Harris urged the members of the Civic Works Committee to reach a definite conclusion, at the earliest possible moment, regarding the widening of Yonge St. north of the C.P.R. tracks to Lawton Ave., so that there may be no unnecessary delay in the double-tracking of that thoroughfare as soon as the Transportation Commission is ready to proceed with the work.

Toronto, Ont.—The following tenders for the construction of the new bridge to be built over the Don River at Gerrard St. were opened by the Board of Control on May 31 and referred to Works Commissioner Harris for report: Roger Miller & Sons, Ltd., Toronto, \$743,781.22; Wells & Grey, Ltd., Toronto, \$739,272.60; and John E. Russell Contracting Co., of Toronto, \$721,519.88.

Toronto, Ont.—If suggestions made by Chief of Police S. J. Dickson to the Ontario Motor League materialize, the roadways of a number of the downtown streets will be widened from one to five feet to accommodate the growing volume of motor traffic. The proposals have been taken up by the executive of the Ontario Motor League and the Secretary, W. G. Robertson, has forwarded a letter to the Board of Control recommending their adoption.

Victoria, B.C.—Public Works Committee has been authorized to rebuild a 40-ft. bridge on Shelbourne St. City Engineer, F. M. Preston.

Victoria, B.C.—City Council agreed to let the C.P.R. construct a portion of the western approach of the Johnston Street bridge in accordance with terms approved by the Public Works Committee.

Victoria, B.C.—Contract for paving with concrete three miles of the Pacific Highway on the lower Mainland from the end of the present paved section at Johnston Road to the Serpentine Flats, has been let by the Provincial Minister of Public Works to the Cotton Co., Ltd., of Vancouver.

Walkerton, Ont.—Tenders closed June 7 for construction of concrete pavement in alley west of Lincoln Rd., between Sandwich and Wyandotte Streets. Town Clerk, A. E. Cock.

Welland, Ont.—Robert Cooper, M. P. P., is agitating for the construction of a county provincial highway from Welland County west to Attercliffe. Five miles west from Beckett's bridge will be constructed this year and other sections will be graded.

Windsor, N.S.—Gorman & Pickrem, of Halifax, have been awarded contract for street paving. Contract consists of re-topping Water St., paving part of Gerrish St., and part of King St., from Lynch's Corner to Curry's Corner.

Windsor, Ont.—Board of Works recommended that contract be awarded to the Cadwell Construction Co. for construction of pavement from the alley west of Janette to Dougall Ave. Wellington Ave., from Tecumseh Road to Elliott St., will be paved by the Chick Contracting Co.

Windsor, Ont.—City Council awarded contract to Pettypiece's, Ltd., of Amherstburg, Ont., for paving Randolph St. at approximately \$5,000; for paving Lot St. to S. P. West, Sandwich, at approximately \$5,000; and contracts for sidewalks on Lawrence and Wyandotte Sts. to L. J. Ryan, of Windsor.

Windsor, Ont.—With the object of boosting the pre-jection of 120-mile tourist road from Detroit to Goderich, W. G. Coutts, of Goderich, was in the Border Cities recently, conferring with several authorities who would naturally be interested in a project of this kind. Mr. Coutts' idea is to make this road a link in the Dixie Highway, which runs from New Orleans to Detroit. He states that several of the towns along the route are already committed to the project, notably Goderich, the proposed terminal. Sanla Chamber of Commerce is calling a conference for representatives of all towns along the route, at which definite plans for the road will probably be made.

Winnipeg, Man.—Contract for construction of granolithic walks awarded to Thos. Jackson & Sons, Colony St. Winnipeg.

Woodstock, Ont.—North Oxford Township Council passed a resolution which calls for the construction of an 0-ft. span bridge over the Thames River. Estimated cost, \$8,125. Clerk, Richard Seldon, Ingersoll.

Yarmouth Tp., Ont.—Township Council passed by-law providing for the construction of sidewalk on the north side of First St., west of St. George St. Clerk, W. C. Caughell. St. Thomas, Ont.

York Tp., Ont.—Township Council authorized an expenditure of \$79,371.83 for sidewalks, pavements and grading. Engineer, Frank Barber, Toronto.

York Tp., Ont.—Township Council awarded following contracts for construction of concrete sidewalks: Goyder Ave. and Greenwood Ave., J. J. Ramsay, Toronto; Mayfield Ave., National Contracting Co.; Mahoney Ave., S. Simpson; Gilbert Ave. and Mortimer Ave., A. J. Penberthy; LeRoy Ave. W. B. Hughes; Queensdale Ave. and Connor Ave., H. S. Walton; Willard Ave., P. Licastro & Co.

WATER, SEWAGE AND REFUSE

Islington, Ont.—A water supply scheme to take in the area from the west of New Toronto east to Long Branch Park, and south from the railway to the lake, at an estimated cost of \$98,000, was submitted to the Etobicoke Township Council by James, Proctor and Redfern, Ltd., Consulting Engineers, Toronto. The improvement will be put to

the vote of the people. Plans for water in the area of the northern boundary of Mimico to the Home Smith property at Lambton Mills were submitted by the Provincial Board of Health, the system to be installed at a cost of \$53,000.

Montreal, Que.—Tenders close June 14 for construction of sewer in Laverdure St., between Gouin Boulevard and 42nd Ave. City Clerk, Rene Bauset.

Montreal, Que.—Director of Public Works decided to recommend to the executive committee the laying of a 48-in. water main from the Point St. Charles Pumping Station to a point in the vicinity of the Place Viger Hotel, a distance of about two miles.

New Toronto, Ont.—Reeve Gardhouse will propose the submission of a by-law for debentures for a water works system from New Toronto to serve Long Branch and the Lake Shore Road district as far west as Etobicoke Creek, south of the Grand Trunk Railway tracks.

Niagara Falls, Ont.—Water Commissioners authorized construction of water mains on following streets: Wilmott St., from First to Fifth; McGrail, Fourth to Centre; Third Ave., Bridge to Hamilton.

Oshawa, Ont.—Board of Water Commissioners decided to grant the request of residents of Simcoe St. South, Cedar Dale Village, for a water supply from the town's mains. Commission decided to construct water mains on Ritson Road, between Eulalie and Olive Avenues.

Port Credit, Ont.—A detailed plan of the proposed water works system was submitted to the Town Council by William Storrie, of Gore Nasmith & Storrie, Consulting Engineers, Toronto. Estimated cost, \$120,000. Plans have been fully approved by Provincial Board of Health.

Riverside, Ont.—Carlotte Bros., Walkerville, secured contract for construction of cast iron water main on Clair View, Elinor and John M. Streets, and also from Ean Claire Water plant to Little River.

St. John, N. B.—A new system of sewerage for the Shamrock grounds is being considered. R. W. Wigmore, Commissioner of Water and Sewerage.

St. Thomas, Ont.—Work on the construction of the sanitary sewer under the eastern end of Malakoff St. will be started shortly, work to be done by day labor. No. 2 Committee of City Council also recommended installation of sanitary sewer under Hiauwatha St. by day labor. City Engineer, W. C. Miller.

Sarnia, Ont.—With the approval of the City Council, the water works committee accepted tenders for annual supplies as follows: Gartshore-Thomson Pipe & Foundry Co., Hamilton, 4 and 6-in. cast iron pipe at \$57 per ton; Kerr Engine Co., 4-in. valves, \$9.55, 6-in. valves, \$16.33; Mueller Mfr. Co., valve boxes, \$7.86; pig lead, \$6.25 per hundred pounds; Dominion Steel Products Co., fire hydrants, \$66 each.

Toronto, Ont.—City Council intends to construct sewers in Dawson St. at a cost of \$3,980.

Welland, Ont.—Tenders closed June 6 for construction of 252 in. ft. 10-in. sewer on Margaret St.; 68 in. ft. 8-in. sewer on Nye Ave.; and 156 in. ft. 10-in. sewer on Queen St. West. City Clerk, W. E. Forster.

Windsor, Ont.—Several sewer contracts were awarded to Carlotte Bros. by Board of Works.

Windsor, Ont.—Contracts to construct sewers and pavements were awarded to Colloff Bros., of Walkerville; the Chick Contracting Co., Windsor; and the Cudwell Co., of Windsor.

York Twp., Ont.—Township Council authorized an expenditure of \$11,982.30 for 6-in. water mains. Engineer, Frank Barber, Toronto.

LIGHT, HEAT AND POWER

Catawaqui, Ont.—A Hydro power line is to be constructed from Kingston here.

Chatham, Ont.—Farmers residing on the 10th Con. in Raleigh Township have made an application to the local Hydro System for an extension along the above concession

road. This will be done when the extensions to Fletcher and Merlin have been completed.

Cobalt, Ont.—Northern Canada Power Co. is proceeding to build another power house.

Merlin, Ont.—Engineers Lawler and Wright, of the Hydro-Electric Power Commission of Ontario, are here making preparations for the construction of the new Hydro line to Merlin.

Pembroke, Ont.—Contract for supplying materials and constructing a dam at the High Falls on Black River has been awarded to A. G. Tweedie, of Sault Ste. Marie, by the Pembroke Electric Light Co.

RAILWAYS

London, Ont.—A large American railroad system, said to be the Pennsylvania, has instructed real estate agents in London and district to proceed without delay to secure data on the cost of land for a right of way through territory between Niagara Falls and Windsor.

Montreal Division, C.N.R.—Tenders will be received until 12 o'clock noon, Saturday, June 24, for construction of six structures. (See official adv.).

Nipissing & Nipigon Divisions, C.N.R.—Tenders will be received until 12 o'clock noon, Saturday, June 24, for the construction of nine structures. (See official adv.).

Ottawa Division, C.N.R.—Tenders will be received until 12 o'clock noon, Saturday, June 24, for construction of two structures. (See official adv.).

Toronto, Ont.—City is ready to proceed with construction of Pape Ave. car line.

FACTORIES AND LARGE BUILDINGS

Ailsa Craig, Ont.—Following tenders were received by Ailsa Craig Farmers' Co-operative Association for construction of concrete grain tanks and warehouse: Jos. Lawson, Crediton; E. Barnes, Ailsa Craig; A. K. Stewart, Parkhill; Ezra & Mazifer, Milverton; T. H. Chambers, Woodstock. Contracts not yet awarded.

Barrie, Ont.—Fire damaged the business section to the extent of about \$50,000.

Birch Cliff, Ont.—General contract for four-roomed addition to Birch Cliff Public School, S.S. No. 15, was awarded to Norman McLeod, Ltd., at approximately \$37,500. Burden, Gouinlock & Carter, Toronto, Associate Architects.

Bonne Bay, Nfld.—The business section was swept by fire which caused a loss of \$250,000.

Brantford, Ont.—Tenders will be received until June 14 for construction of Terrace Hill School. Architect, F. C. Bodley, Commercial Chambers, Brantford.

Burnaby, B.C.—Tenders closed June 9 for erection of a High School building on the Kingsway school site. Architects, McCarter & Nairne, 509 Richards St.

Calgary, Alta.—General contract for four-roomed addition to St. Anne's School, East Calgary, was awarded to C. W. Pettifer, 1018 9th Ave. West, for \$15,668; plumbing and heating, Young Plumbing Co., 1st St. East, \$3,290.

Charlottetown, P.E.I.—Tenders addressed to Rev. J. Rooney, Secretary, will be received until June 15 for construction of Charlottetown Hospital. Plans and specifications may be seen at office of C. B. Chappell & Hunter, Architects, Charlottetown.

Creston, B.C.—Board of Education considering extensions to High School.

Crowland Twp., Ont.—Township Council passed a by-law providing for the raising of \$32,000 for the construction of a four-room addition to Maple Leaf Park School. Clerk, Wallace Houthy, Welland.

Edmonton, Alta.—Ratepayers passed library and school by-laws. City Clerk, C. E. K. Cox.

Edmonton, Alta.—Fire destroyed the Mercer Block, a four-storey building on 104th St., causing an approximate loss of \$100,000.

Edmonton, Alta.—Hudson's Bay Co. plans the erection of a large warehouse between 106th and 107th Sts., at an approximate cost of \$60,000.

The Canadian Engineer

A Weekly Paper for Civil Engineers and Contractors

Engineering Profession Act, Province of Ontario

Complete Text of Act as Finally Passed by Provincial Legislature and Signed by Lieutenant-Governor—Engineers Accept Act Despite Numerous Changes, and Will Proceed With Registration of Professional Engineers

HAVING received the signature of the Lieutenant-Governor of Ontario on June 13, the "Act Respecting Professional Engineers" is now on the statute books of that province. The bill was introduced as No. 67 by Col. A. W. Gray, M.P.P., the only professional engineer who is at present a member of the Ontario Legislature. It received in its first reading on April 6, 1921; second reading, April 20, 1921; third reading, June 5, 1922, the previous session having been prorogued without giving the bill its final reading.

Numerous changes were made in the bill every time it was considered by the House or in Committee, and several sections that were in the original draft have been deleted, while others have been altered. It has been decided, however, by the Legislation Committee, of the various engineering societies to accept the Act as passed and to go ahead with the formation of the "Association of Professional Engineers of the Province of Ontario."

General C. H. Mitchell, dean of the Faculty of Applied Science of the University of Toronto, who is president of the provisional council of the association, is in British Columbia, and no meeting of the council will be held until his return to Toronto. The vice-president of the provisional council is R. A. Bryce, consulting mining engineer, Toronto. The provisional councillors are Willis Chipman, consulting civil engineer, Toronto; J. B. Challies,

Director of Water Powers, Ottawa; Col. A. W. Gray, M.P.P., of Westport, Ont.; H. G. Acres, chief hydraulic engineer of the Ontario Hydro-Electric Power Commission, Toronto; H. H. Angus, consulting mechanical engineer, Toronto; A. K. Spotton, chief engineer, Goldie & McCulloch Co., Ltd., Galt, Ont.; Prof. J. W. Bain, associate professor of applied chemistry, University of Toronto; S. F. Kirkpatrick, consulting chemical engineer, Ottawa, Ont.; Harold Van der Linde, vice-president of the Van der Linde Rubber Corporation, Toronto; H. V. Hart, general manager and chief engineer, Canadian Westinghouse Co., Ltd., Toronto; F. R. Ewart, consulting electrical engineer, Toronto; M. J. McHenry, manager, Walkerville Hydro-Electric System, Walkerville, Ont.; G. R. Mickle, mine assessor, Parliament Buildings, Toronto; Prof. H. E. T. Haultain, professor of mining engineering, University of Toronto; James McEvoy, consulting mining engineer and geologist, Toronto.

Following is the complete text of the Act as signed by the Lieutenant-Governor:

An Act respecting Professional Engineers.

His Majesty, by and with the advice and consent of the Legislative Assembly of the Province of Ontario, enacts as follows:

1. This Act may be cited as The Professional Engineers' Act, 1922.

2. In this Act (a) "Association" shall mean the As-

Willis Chipman

J. B. Challies

Col. A. W. Gray

CIVIL ENGINEERING REPRESENTATIVES ON THE FIRST COUNCIL OF THE ASSOCIATION OF PROFESSIONAL ENGINEERS ONTARIO

sociation of Professional Engineers of the Province of Ontario; (b) "Board" shall mean the Board of Examiners of the Association; (c) "Council" shall mean the Council of the Association; (d) "Licensed" shall mean that permission has been granted by the council to a non-resident engineer to practise temporarily without being registered, and "License" shall mean the official certificate under the seal of the Association evidencing such permission; (e) "Member" shall mean a Registered Member of the Association; (f) "President" shall mean the President of the Association; (g) "Professional Engineering" save as herein-after mentioned, shall mean the advising on, the reporting on, the designing of, the supervising of the construction of, all public utilities, industrial works, railways, tramways,

FESSIONAL ENGINEERS OF
ONTARIO

bridges, tunnels, highways, roads, canals, harbour works, light houses, river improvements, wet docks, dry docks, floating docks, dredges, cranes, drainage works, irrigation works, waterworks, water purification plants, sewerage works, sewage disposal works, incinerators, hydraulic works, power transmission, steel, concrete and reinforced concrete structures, electric lighting systems, electric power plants, electric machinery, electric apparatus, telephone systems, telegraph systems, cables, wireless plants, mineral property, mining machinery, mining development, mining operations, gas and oil developments, smelters, refineries, metallurgical machinery, and equipment and apparatus for carrying out such operations, machinery, steam engines, hydraulic turbines, pumps, internal combustion engines and other mechanical structures, chemical and metallurgical machinery, apparatus and processes, aeroplanes, air ships, and all other engineering works; (h) "Registered" shall mean that an engineer has been admitted to membership in the Association and that his name has been enrolled in the register; and "Certificate of Registration" shall mean the official certificate under the seal of the Association evidencing the same; (i) "Registrar" shall mean the Registrar of the Association; (j) "Secretary" shall mean the Secretary or the Secretary-Treasurer of the Association; (k) "Vice-President" shall mean the Vice-President of the Association.

3.—(1) All persons registered as professional engineers under the provisions of this Act shall constitute the "Association of Professional Engineers of the Province of

Ontario" and shall be a body politic and corporate, with perpetual succession and a common seal.

(2) The head office of the Association shall be at the City of Toronto.

(3) The Association shall have power to acquire and hold real or personal property not producing at any time an annual income in excess of \$10,000, and to alienate, mortgage, lease, or otherwise dispose of such property or any part thereof as occasion may require.

(4) All fees, fines and penalties receivable and recoverable under this Act shall belong to the Association.

4. The Association may pass by-laws not inconsistent with the provisions of this Act for:

(a) The election of "council"; (b) The government and discipline of the members; (c) the management of its property; (d) the appointment of such officers as may be necessary for carrying out the purposes of the Association; (e) the maintenance of the Association by fixing, levying and collecting the necessary fee from each member and licensee, which fee shall not exceed \$10 per annum; (f) the admission of candidates to registration; (g) the keeping of the "register"; (h) fixing dates and places of meetings of the "Association"; (i) all such other purposes as may be deemed necessary or convenient for the management of the association, or the conduct of its business.

5. No by-law of the association or amendment thereto shall be valid or take effect until approved by the Lieutenant-Governor in Council.

6.—(1) For purposes of representation upon the council and for registration, and for such purposes only as are hereinafter set out, membership of the association shall be subdivided into the following branches: Civil engineers, mechanical engineers, chemical engineers, electrical engineers, mining engineers.

(2) Each member admitted to the association may register in all branches for which he can submit credentials satisfactory to the authority governing admission to each of such branches, but he shall, however, vote in only one such branch according to his own selection, but may transfer his vote to some other branch in which he is registered, upon the approval of the council.

7. Additional branches may be established by the Lieutenant-Governor in Council upon the petition of not less than 100 registered members of the association, provided such petition be approved by the council, or upon petition of 200 members of the association if such approval be not obtained.

8.—(1) The council shall consist of a president, a vice-president, an immediate past-president and three councillors from each branch of the association, all of whom shall be registered members of the association.

(2) The president, who shall be elected annually by vote of members, shall hold office until his successor is elected, shall act as presiding officer at the meetings of the council and of the association, voting only when the votes are evenly divided, and on his retirement shall hold office as councillor for the next year succeeding.

(3) The vice-president shall be elected annually by vote of members, and shall have all the powers of the president during the absence of the latter.

(4) Two councillors shall be elected annually from each branch of the association by the vote of the registered members in such branch, and one councillor from each branch shall be appointed by the Lieutenant-Governor in Council.

(5) The council shall appoint a registrar and a secretary who shall hold office during the pleasure of the council.

9.—(1) The members of the council representing each branch shall control, subject to the terms of this Act, the conditions for registration and for licensing in such branch, including credentials, examinations and exemptions.

(2) The council as a whole shall have the power to review the establishment of and the carrying out of the conditions for registration as administered by the representative councillors from all branches, and shall have the power to require the representatives of such branches to modify

their administration in order to maintain a standard of qualification in members satisfactory to the council.

(3) The revocation of certificates and the reissuing of such certificates, the questions of discipline, fines, suspensions, expulsion, finance, overlapping of practice in branches, and all matters not coming within the provisions of subsection (1) shall be dealt with by the council as a whole.

Registration Within One Year

10.—(1) Any person residing in the Province of Ontario at the date of the passing of this Act, who has been engaged in engineering for five or more years, shall be entitled to be duly registered as a member of the association without examination, provided that such person shall produce to the council, within one year of the passing of this Act, satisfactory evidence of having been so engaged.

(2) Any person residing in the Province of Ontario, not qualified as in subsection (1) above, may make application for membership in the association and shall successfully pass such examination as shall be prescribed by council, or submit credentials satisfactory to the council, to be admitted to membership.

(3) Any person who applies for membership in the association within one year from the passing of this Act shall submit to the council with his application a statement giving a summary of his engineering experience, which statement shall be made upon the forms prescribed by the council.

(4) The council may require the applicant for membership to prove the correctness of the statements made in his application by attesting by oath or by affidavit.

(5) If the evidence of employment as engineer for five years, as submitted by the applicant, be considered satisfactory by the members of the council representing the branch to which admission is desired, he shall be admitted to membership in the association without examination and the registrar shall issue a certificate of registration to applicant and enter his name in the register.

(6) Any person duly authorized and registered as an Ontario land surveyor at the date of the passing of this Act shall be entitled on application within one year of the passing of this Act, to be admitted as a member of the association in the branch of civil engineers.

11. If the applicant for membership has been engaged for less than five years as a professional engineer at the date of the passing of this Act, he shall submit certificates and proofs respecting the period of his employment to the date of his application, and the members of council, representing the branch to which admission is desired, will determine from the evidence so submitted the period of such employment.

Registration After One Year

12. Any person resident in the Province of Ontario who has applied for membership in the association within one year from the passing of this Act, who has not been admitted under the provisions of section 10, shall file with the secretary a notice setting forth his employment and the name of his employer, which notice shall be filed annually during the term necessary to complete the five years of employment, and if such person's record of employment is satisfactory, he shall be admitted to membership without examination.

13.—(1) Any person who applies for membership in the association after one year from the passing of this Act shall submit to the council with his application a statement giving a summary of his experience as an engineer or surveyor which statement shall be made upon the forms prescribed by the council.

(2) The council may require the applicant for membership to prove the correctness of the statement made with his application by attesting by oath or by affidavit.

(3) If the evidence of engineering experience for not less than five years, as submitted by the applicant, is considered satisfactory by members of council representing the branch to which admission is desired, the applicant shall be admitted to membership after successfully passing the pre-

scribed examination in the theory and practice of such branch of engineering or, in lieu of such examination, upon submission of evidence satisfactory to the members of council representing such branch and to the council as a whole.

(4) An applicant who is required to successfully pass an examination may select any one or more branches of engineering for his examination.

14. Any resident of Canada who may come to reside in the Province of Ontario and who at the time is a duly registered member of an association of professional engineers in any province of the Dominion of Canada similarly constituted to this association, may upon application made

Brig.-Gen. C. H. Mitchell
PRESIDENT OF THE COUNCIL
PROFESSIONAL ENGINEERS
OF ONTARIO

to council be admitted to membership upon producing a certificate of membership in such province.

15. Any person who comes to reside in Ontario who is a registered member of any association or institute in other parts of the British Empire or in the United States similarly constituted to this association, and which grants reciprocal privileges and who applies for membership in this association, may be admitted to membership upon producing to council a certificate of membership in such association or institute.

Graduates

16.—(1) Any graduate in any branch of engineering or of science, the practice of which constitutes professional engineering as defined in clause (g) of section 2, from any university recognized by the council upon presenting evidence of graduation satisfactory to the council will be granted, as part of his term of employment, the actual time of instruction in such university, this total not to exceed four years and such graduate will not be required to submit to a written examination.

(2) Graduates or undergraduates of recognized engineering colleges or bona fide assistants serving under articles may during the remainder of their respective periods required for registration be engaged in professional engineering as defined in this Act under the guidance of professional engineers who assume full responsibility for their work, but shall not be classed as professional engineers until registered as members of the association as provided in this Act.

(3) Such graduates, undergraduates, or assistants serv-

ing under articles may, during their respective engineering courses or terms of service, be recorded with the association, and such graduates, undergraduates, or assistants serving under articles shall be subjected to the control of the council as provided in this Act and to the by-laws of the association, but shall not be members of the association.

Licensing

17.—(1) Any person not residing in the Province of Ontario who is a registered member of an association of engineers similarly constituted of any other province of the Dominion of Canada may upon application obtain from the registrar a license to practice as a professional engineer in the Province of Ontario upon production of evidence of his registry in such other province.

(2) Any person who is not a resident of Canada, but who in the opinion of the members of council in any branch is recognized as a consulting specialist in such branch of engineering, and has had not less than ten years of experience in the practice of his profession, or who presents evidence to satisfy such members of council that he has equal qualifications with those required for registration in such branch of the profession, may, with the approval of the members of council of such branch, be granted a license to practice in that branch.

(3) Any professional engineer who is a resident of some other province of Canada in which there is no association of engineers similarly constituted may obtain a license to practice in a branch of engineering, subject to the approval of the members of council representing such branch.

(4) In the event of any such person mentioned in this section being unable by reason of emergency or neglect on the part of the registrar, or for any other good and sufficient reason, to obtain such license within three months of his making application therefor, he shall be entitled to practice as a professional engineer in the province for such period of three months without holding such license.

18. Any person who is employed as a professional engineer by a public service corporation, public utilities or Government department, who is by reason of his employment required to practise as a professional engineer in provinces other than that of his residence, may so practise, in the Province of Ontario without holding a non-resident license or payment of fee, providing such person can on demand of the council produce credentials satisfactory to the council showing that he is a registered member of an association of engineers similarly constituted by some other province of Canada.

Membership

19.—(1) Only such persons who are members of the association hereby incorporated, and registered as such under the provisions of this Act, or who have received a license from the council of the association as hereafter provided, shall be entitled within the Province of Ontario to take and use the title "Registered Professional Engineer," or any abbreviation thereof.

(2) Each member of the association shall have a seal, the impression of which shall contain the name of the engineer and the words "Registered Professional Engineer" and "Province of Ontario," with which seal he shall stamp all official documents and plans, and the design of such seal shall be approved by the council.

20. The provisions of this Act shall not apply against any person while carrying on his duties in His Majesty's naval, military or aerial service.

21. Engineers who were employed in professional engineering in the Province of Ontario, and who were accepted for overseas service in the war of 1914-1919, in the forces of Great Britain or any of her allies, shall on their return to Canada be entitled to all the rights and privileges conferred under section 10.

22. Notwithstanding any other provision of this Act; no person shall be registered as a member of the association until after he has attained the age of twenty-one years.

23.—(1) In the case of two or more persons carrying on a practice as professional engineers in co-partnership,

only such members who are registered or licensed under this Act shall individually assume the function of a professional engineer.

(2) A firm or corporation of professional engineers cannot, as such, be deemed to be a member of the association or be licensed to practise.

Examinations

24. The council shall appoint annually a board of examiners for each branch of engineering from nominations made by members of council representing each of such branches.

25.—(1) Examinations of candidates for registration or for license shall be held at least once per annum, at such place as the council may direct.

(2) The scope of the examinations and the methods of procedure shall be prescribed for each branch by the members of council representing such branch, with special reference to the applicant's ability to design and supervise engineering works which shall insure the safety of life and property.

(3) The board shall examine all degrees, diplomas, certificates and other credentials presented or given in evidence for the purpose of obtaining registration or license to practise, if referred to them by the council, and may require the holder of such degree, diploma, certificate or other credentials to attest on oath, viva voce or by affidavit concerning the matter of his application.

(4) The candidate shall submit to an examination before the board, or before such members of the board as may be deputed by the council to conduct such examination, on such branch or branches of professional engineering as the candidate may select.

(5) As soon as possible after the close of each examination the members of the board who shall have conducted such examination shall make and file with the secretary a certificate stating the result of such examination, whereupon the council shall notify each candidate of the result of his examination and of their decision upon his application.

(6) A candidate failing on examination may after an interval of not less than nine months be examined again.

(7) The council shall from time to time prescribe the fees payable by candidates for examination, which fees shall be payable in advance by the candidates.

26. The council shall have power to establish conjointly with any council of any association similarly constituted in one or more of the provinces of Canada a central examining board, and to delegate to such central examining board all or any of the powers possessed by the said council respecting the examinations of candidates for admission to practise, provided that any examination conducted by such central examining board shall be held at least in one place within this province.

Registrar and Registrar

27.—(1) The registrar shall issue a certificate of membership to each member admitted to the association by the council, such certificate to be signed by the president or the vice-president and by the registrar, and it shall bear the seal of the association, and shall also state the branch or branches of engineering in which the member was examined or otherwise accepted.

(2) The registrar shall issue a license to practise to any person entitled thereto, such license to specify the work upon which the holder of the license is to be employed and the period for which the same is issued, but in no case shall the period extend beyond the end of the calendar year in which such license was issued.

(3) The registrar shall enroll in the register provided by the council the names of all persons admitted to the association by the council, also the names of all persons licensed by the council.

28. The registrar shall keep the register correct and in accordance with the provisions of this Act and the instructions of the council.

29. The annual fee due from a member shall be deemed to be a debt due the association and may be recoverable with the costs of same from such member in the name

of the council or of the association in any court of competent jurisdiction.

30.—(1) If any member neglects or refuses to pay the annual fee for six months from the date upon which it became due after written notice from the secretary to the member's last known address on the register, the registrar shall cause the name of such member to be erased from the register, and such person shall thereupon cease to be a member, but such person shall at any time thereafter, upon payment of such fees as may be prescribed by the council, be entitled to reinstatement as a member.

(2) Any member may resign from membership in the association upon giving written notice to the secretary and by payment of all dues in arrears, if any, whereupon the name of such member shall be erased from the register and such member shall be relieved of the liability for further annual dues, but such person shall at any time in the future be admitted as a member upon payment of the fees prescribed by the council.

(3) Any member whose name has been erased from the register shall not be entitled to any of the rights and privileges conferred by the provisions of this Act until he has been re-admitted as a member.

31. In case the council should refuse to register any applicant for membership in the association, or refuse to issue a license to practise to any applicant, therefor, the person aggrieved shall have the right to apply to a judge of the Supreme Court of Ontario, who upon due cause the name of such person as a member of the association, or shown may make an order directing the council to register to grant a license to practise, or make such other order as may be warranted by the facts, and the council shall forthwith comply with such order and such order when so made shall be final.

32. The certificate of registration under the seal of the association shall be prima facie evidence of registration.

33.—(1) The council may, in its discretion, reprimand or censure or suspend or expel any member guilty of unprofessional conduct, or of gross negligence or of continued breach of the by-laws of the association, or any member convicted of a serious criminal offence by a court of competent jurisdiction.

(2) The council shall not take any such action until after a complaint under oath has been filed with the secretary or the registrar, and a copy forwarded to the member accused, who shall be given an opportunity of submitting evidence in his defence, and the council shall not suspend nor expel a member without having previously summoned him to appear before the council, nor without having heard evidence under oath offered in support of the complaint and in behalf of the member accused.

(3) The council shall have the same powers as Commissioners under The Public Enquiries Act to compel witnesses to appear and give evidence under oath in the manner and under penalties prescribed by such court, and all such evidence shall be taken in writing or by a duly qualified stenographer.

(4) Any member suspended or expelled may within sixty days after the order of suspension or expulsion appeal to a judge of the Supreme Court of Ontario from such order or resolution, giving not less than seven days' notice of such appeal to the secretary of the association, and the practice and procedure in such an appeal shall be the same as upon an appeal from a master or referee.

(5) Pending an appeal, the member suspended or expelled by council may continue to practise, but unless the order of suspension or of expulsion be set aside, the member so suspended or expelled shall not practise thereafter except upon the expiry of the period of suspension (in case of suspension.)

34. Any person in the Province of Ontario who, not being registered as a member of the Association in the Province of Ontario, or licensed by the association, (a) uses verbally or otherwise the title of professional engineer, or makes use of any addition to or abbreviation of such title, or of any words, name or designation that will lead to the belief that he is a professional engineer or a member of the

association; (b) advertises or holds himself out in any way or by any means as a member of the association, shall be liable upon summary conviction by any court of competent jurisdiction to a fine of not less than \$100 nor more than \$200 for the first offence, and to a fine of not less than \$200 nor more than \$500 for any subsequent offence.

35. If the registrar makes or causes to be made wilful falsification of the register, or in matters connected therewith, he shall upon conviction be liable to a fine of not less than \$100.

36. Any person who wilfully procures or attempts to procure for himself registration as member in the association by making, producing or causing to be made or produced any fraudulent representation or declaration, either verbal or written, and any person knowingly aiding and assisting him therein, shall upon conviction be liable to a fine of not less than \$200.

37. Any and all penalties imposed under this Act, and any and all moneys forfeited shall be recoverable with costs under the provisions of The Ontario Summary Convictions Act, and all such sums shall belong to the association.

38. No proceedings shall be commenced for any violation against the provisions of this Act after one year from the date of the committal of such violation.

Provisional Council

39.—(1) The following persons are hereby constituted as a provisional council of the association:

President—Charles Hamilton Mitchell, of Toronto.
Vice-president—Robert Alexander Bryce, of Toronto.
Councillors—Representing branch of Civil Engineers—Willis Chipman, of Toronto; John Bow Challies, of Ottawa; Andrew Wellington Gray, of Westport. Representing branch of Mechanical Engineers—Henry G. Acres, of Toronto; Harry Holborn Angus, of Toronto; Arthur Knowlton Spotton, of Galt. Representing branch of Chemical Engineers—James Watson Bain, of Toronto; Stafford Frederick Kirkpatrick, of Ottawa; Harold Van der Linde, of Toronto. Representing branch of Electrical Engineers—Henry U. Hart, of Hamilton; Frank Richard Ewart, of Toronto; Morris James McHenry, of Walkerville. Representing branch of Mining Engineers—George Reginald Mickle, of Toronto; H. E. T. Haultain, of Toronto; James McEvoy, Toronto. All of whom shall hold office until their successors have been elected and appointed.

(2) If a vacancy should occur in the Provisional Council it shall be filled by the Lieutenant-Governor in Council, who shall notify each member of the Provisional Council of such appointment.

40.—(1) The Provisional Council shall provide the register called for by this Act, and shall cause to be entered therein the names of all persons who are entitled to registration and who apply therefor.

(2) The Provisional Council shall, within four months from the passing of this Act, prepare provisional by-laws not inconsistent with the Act for the various purposes specified in section 4 of this Act, which shall not be valid until approved by the Lieutenant-Governor in Council.

(3) The Provisional Council shall publish a copy of the register within five months from the passage of this Act, and shall mail one copy of such register to each member, and to any person who may apply for a copy, and the Lieutenant-Governor in Council shall also be furnished with a certified copy of the register and of the provisional by-laws.

(4) The Provisional Council shall call a general meeting of the members of the association for the purpose of electing the members of council, for confirmation or revision of by-laws, and for organization purposes, and for such other purposes as specified in the notice calling the meeting, such general meetings to be held not later than seven months, nor earlier than five months after this Act comes into force.

41. No provisions of this Act imposing penalties shall take effect until one year after the coming into force of this Act.

42. This Act shall come into force and take effect on the day upon which it receives the Royal Assent.

HYDRAULIC TURBINES*

Some of the Principles Controlling Their Use and Design—
Reaction Turbines — Runners and
Draft Tubes

By Lewis F. Moody,

Consulting Engineer, William Cramp & Sons Ship & Engine Building Co., Philadelphia, Pa.

BEFORE going into the hydraulic principles governing the action of hydraulic turbines, it will be well to be sure that we understand the two general classifications of turbines and the line of separation between them. We are confronted at the start with the two terms used to distinguish these two classes, and these terms are probably responsible for many misconceptions. The terms themselves do not distinguish and have little meaning.

Impulse turbines are those in which the water under pressure is discharged through nozzles or orifices and its potential energy converted into the kinetic form, so that the water issues with all of its head converted into the velocity form at atmospheric pressure, or pressure substantially atmospheric. The water, in the form of a free jet, or jets, acts against one surface of a series of open buckets mounted on a revolving element, and the action of the water in passing through this wheel takes place entirely at constant pressure, this whole action being open to the air.

In the so-called reaction turbine, on the other hand, the entire operation takes place in a closed system of passages, the water being everywhere under pressures different from that of the atmosphere, and the flow not being open to the air.

In the modern reaction turbine, the water is discharged through a ring of guide vanes which give it a rotary or whirling motion about the turbine axis, its initial potential energy being converted only in part into the kinetic form, a considerable portion still remaining as pressure head. The water is then passed through a rotating runner in which the energy is abstracted from the water, the water discharging into a closed draft tube at a pressure usually considerably less than atmospheric, and with a considerable amount of

having a series of rotating arms discharging the water in backwardly directed jets. The latter device, known as "Barker's Mill," which somewhat resembles a lawn-sprinkler, is a true reaction turbine in the sense originally intended. It is interesting to note that neither the modern impulse turbine nor reaction turbine operates on the prin-

FIG. 2

ciples of the primitive wheels just mentioned. It is worth noting that the high-speed reaction turbine of today actually discharges the water from the runner in the same direction as the motion of the runner, so that its reaction, in the sense used originally, is in the opposite direction to the rotation of the wheel, tending to oppose its motion. Furthermore, both turbines are dependent upon the impulse of the entering water to produce the driving torque. In the following discussion of principles, I shall direct my attention chiefly to the reaction turbine.

Most engineers are thoroughly familiar with the theory of the turbine, but hydraulics is a subject so liable to misconceptions that I think it may be useful to touch briefly a few of the high spots of this particular branch. In approaching any hydraulic problem there are two possible plans of attack, both of which are worth keeping in mind:

The first is to establish energy relations; that is, to find out what becomes of the energy involved. The second is to establish the conditions of equilibrium under the forces of impulse and reaction; that is, to depend on the principle of momentum of the moving water.

The first method makes use of the Bernoulli formula, and the second utilizes the fact that a flowing stream or jet exerts in the opposite direction to its motion a reaction equal to $W V/g$, where W is the weight of water discharged per second, V the velocity in feet per second, and g the acceleration of gravity. If a jet be discharged into a tank so that its velocity be destroyed, or if it impinge on a plate so that no velocity remains in the original direction, it exerts a forward impulse of the same amount.

Applying the first method, we can write the Bernoulli formula for the stationary parts of the turbine system, or any other system for that matter, as follows (See Fig. 1):

$$\text{From intake to entrance to runner,} \\ h_a + H_1 - L_1 = h_{p1} + C_1^2/2g \quad \dots \dots \dots (1)$$

$$\text{From discharge from runner to tailwater,} \\ h_{p2} + C_2^2/2g + H_2 - L_2 = h_a + C_3^2/2g \quad \dots \dots (2)$$

Where h_a = Head corresponding to atmospheric pressure.

h_{p1} = Absolute pressure head at runner entrance.

h_{p2} = Absolute pressure head at runner discharge.

L_1 = Loss of head from intake to runner entrance.

L_2 = Loss of head in runner.

L_3 = Loss of head in draft tube.

C_1 = Absolute velocity of flow into runner.

C_2 = Absolute velocity of flow out of runner.

C_3 = Absolute velocity of flow out of draft tube.

FIG. 1

kinetic energy or velocity head still remaining in the water.

The above names used to classify turbines perhaps originated in the one case in wheels in which a jet impinged on a series of flat paddles, and in the other case in wheels

*Address at the Symposium on Water Power Development, University of Toronto, February 27, 1922.

In writing the equation from entrance to discharge of runner, it must be remembered that in the runner a portion of the available energy is converted into useful work. A term must therefore be subtracted from the initial energy to leave the energy remaining at the runner discharge. The energy converted into useful work per second is WH_e , where H is the total effective head available for the turbine and e the turbine efficiency. Since in this equation we are talking about head, and since head is the energy per pound of water, the amount of head converted into useful work is He . We therefore have.

$$h_{p1} + (C_1^2/2g) - He - L_2 = h_{p2} + C_2^2/2g \dots\dots\dots (3)$$

Or, from (1) and (2), we can find the effective head on the runner by taking the difference between the sum of pressure and velocity heads at entrance, and that at discharge, also subtracting the loss of head in the runner, thus:

$$[h_{p1} + C_1^2/2g] - [h_{p2} + (C_2^2/2g)] - L_2 = H_1 + H_2 - L_1 - L_2 - L_3 = (C_2^2/2g).$$

The second term is evidently H - (total loss of head), which is equal to He , and substituting this and transposing, we again have equation (3).

The above relations may appear to be so elementary that they are hardly worth stating; and yet they have not always been observed. In particular, many turbines have been located at a height H_1 above tail water, which requires in equation (2) an absolute pressure h_{p1} amounting to less than zero.

Let us now go a step further and apply the Bernoulli formula with reference to the rotating system of the runner. The method of determining the flow in a rotating system may be explained in a simple manner. Suppose we have to consider two tanks on a merry-go-round at different distances from the axis of rotation and at different elevations. How shall we determine the flow through a connecting pipe:

If the system be stationary, it is quite easy to do this by applying the Bernoulli formula between one tank and the other, just as was done above for the turbine intake.

If the system be rotating, however, let us imagine first that we have a single large tank located below the two tanks to be investigated. (See Fig. 2).

The water surface in the large tank will take up the form of a paraboloid of revolution; and the difference of elevation at any two points in the surface, such as those just below the two tanks of the problem, is equal to the difference of the velocity heads corresponding to the rotation of

FIG. 3

the tank; that is, of the system. This difference of elevation is $u_1^2/2g - u_2^2/2g$.

Any particle in the water surface is in equilibrium and has no tendency to move either one way or the other. It is the amount of elevation above this surface which determines the head available to produce flow. Therefore, to apply

the Bernoulli formula to such a rotating system, it is only necessary to measure all elevations above a paraboloidal surface corresponding to the speed of rotation. This surface becomes a datum surface, taking the place of a plane horizontal surface in stationary problems. Thus we have for the above problem:

Head producing flow

$$= h_1 - h_2 = z_1 - (u_1^2/2g) - z_2 + (u_2^2/2g).$$

The effective head at any point of a rotating system is the sum of the pressure head, the velocity head due to the

FIG. 4

relative velocity, and the elevation head above the paraboloidal datum surface.

Applying this principle to the turbine runner from the point of entrance to the point of discharge, we therefore have

$$h_{p1} + w_1^2/2g - u_1^2/2g - L_2 = h_{p2} + w_2^2/2g - u_2^2/2g \dots\dots (4)$$

We can now obtain from either (3) or (4) an expression for the pressure drop through the runner, and equating the two expressions thus found, we have:

$$h_{p1} - h_{p2} = He - C_1^2/2g + C_2^2/2g + L_2 = u_1^2/2g - u_2^2/2g - w_1^2/2g + w_2^2/2g + L_2$$

From which we obtain:

$$He = (C_1^2 - w_1^2 + u_1^2)/2g - (C_2^2 - w_2^2 + u_2^2)/2g \dots\dots (5)$$

Drawing the triangles at entrance and discharge from the runner to represent the relation between the relative and absolute velocities at these points, we have Fig. 3. Here C_1 and C_2 represent the absolute velocity of flow, and w_1 and w_2 the velocity considered relatively to the rotating system; u_1 and u_2 being the corresponding velocities of points on the rotating system itself, that is, the circumferential velocities at the points of entrance and discharge of the runner. These relations between the relative and absolute velocities can be expressed trigonometrically as follows:

$$w_1^2 = C_1^2 + u_1^2 - 2 u_1 C_1 \cos \alpha_1 \\ w_2^2 = C_2^2 + u_2^2 - 2 u_2 C_2 \cos \alpha_2$$

If we denote by C_{u1} , the tangential component $C_1 \cos \alpha_1$, of the absolute entrance velocity, which we may refer to as

the absolute entrance whirl, and similarly, if we put C_{u2} for the absolute discharge whirl $C_2 \cos \alpha_2$, we shall have

$$C_1^2 - w_1^2 + u_1^2 = 2 u_1 C_{u1}$$

$$\text{and } C_2^2 - w_2^2 + u_2^2 = 2 u_2 C_{u2}$$

By substitution of these values, (5) reduces to the simple relation

$$u_1 C_{u1} - u_2 C_{u2} = g H e \dots\dots\dots (6)$$

This equation is a fundamental one and forms a reliable basis for the design of a turbine. In the design of turbines

FIG. 5

of low specific speed C_{u2} may be taken as close to zero, and the second term may then be dropped. For the attainment of very high speeds, the second term may be given a considerable value in comparison with the first term. The turbine shown somewhat diagrammatically in Fig. 5 utilizes this principle.

If we approach the analysis of a turbine by the second method mentioned, we can proceed as follows:

Referring to Fig. 4, suppose we have a space bounded by surfaces of revolution swept up by rotating curves of any desired form about the axis, and let us suppose this space to be filled with water flowing inward around the periphery and outward at the bottom, this water at the same time being given an initial whirl in addition to its inward velocity. Suppose that the flow is steady; that is, the same from instant to instant, and consider the annular space marked by the double hatching. This ring is continually filled with water which is flowing in through its outer cylindrical surface of radius r_1 and out through its inner surface of radius r_2 , and at any particular point in the space the velocity, pressure and other conditions will be constant with respect to time. This ring of water is therefore in equilibrium and the forces acting upon it are balanced, and the velocity at any point has zero acceleration. The water entering the ring-formed space exerts a force in the direction of its motion equal to its weight multiplied by V/g ; and if the total weight of water entering per second around the periphery is W , the tangential component of the impulse of each elementary stream of water will be equal to the weight flowing multiplied by C_{u1}/g , and the moment exerted by all of the entering streams upon the ring of water, tending to rotate it about the axis will be equal to $W r_1 C_{u1}/g$.

Similarly, the backward reaction of the entire leaving stream will be $W r_2 C_{u2}/g$, the value of W , of course, being the same in both expressions, since the amount of water leaving is equal to that entering in accordance with continuity of flow. In such an elementary space containing no vanes, either stationary or rotating, there is no other force which can act upon the water in a circumferential direction and therefore the algebraic sum of the two turning moments must be zero, or

$$W r_1 C_{u1}/g = W r_2 C_{u2}/g = 0.$$

$$\text{Or, } r_1 C_{u1} = r_2 C_{u2} \dots\dots\dots (7)$$

This relation applies to any unobstructed space in which water may freely rotate, and can therefore be applied,

for example, to the water after it is discharged from the turbine guide vanes and before it enters the runner, and to the water in a draft tube which is bounded by surfaces of revolution co-axial with the runner.

The spiral casing for a turbine may also be so formed that the flow within it conforms to the above relation and the same thing applies to the casing of a centrifugal pump. The writer considers this to be the proper condition to observe in the design of such spiral casings, as it permits the flow to conform with the natural conditions which would exist if the spiral guiding wall were absent.

Let us now consider the conditions which we would have if the space of Fig. 4, instead of being unobstructed, contained a series of vanes. In this case, the moments of the entering and leaving water would be no longer equal and opposite, but they would differ by the amount of the moment exerted against the vanes (See Fig. 5). In this way we would obtain for the moment exerted on the turbine runner the expression

$$\text{Moment} = (W/g) (r_1 C_{u1} - r_2 C_{u2}) \dots\dots (8)$$

If we multiply this amount by the angular velocity, ω , of the runner, we shall have the work done by the runner per second, that is,

$$(W/g) (\omega r_1 C_{u1} - \omega r_2 C_{u2}) = W H e,$$

or, in terms of circumferential velocities of the runner,

$$u_1 C_{u1} - u_2 C_{u2} = g H e.$$

This result will be recognized as the same as equation (6) previously derived from energy considerations. Although derived for the modern turbine, this formula is applicable to all forms, both reaction and impulse turbines whether the flow is in a continuous ring or divided into separate jets.

These relations are, of course, not new, although there are probably many opportunities for applying them which have not been utilized. Equation (8) was announced by Leonard Euler in 1754, and the principle of equation (7) was known in the case of a vortex to Leonardo da Vinci.

More specifically, these principles when applied to a spiral casing of a turbine call for velocities at various points around the circumference which increase as the water approaches the axis, the velocity varying inversely as the radius according to equation (7). When applied to the transition space between the guide vanes and the runner, in a turbine of the type of Fig. 5, if we start with a given velocity of discharge from the guide vanes we can compute the velocity at various points along the entrance edge of the runner vane at different radial distances from the axis by multiplying the velocity in each case by the inverse ratio of the radii of the runner vane tips and guide vane tips.

When applied to a draft tube formed as a surface of revolution (Fig. 5), this principle, which is simply an application of the principle of constancy of moment of momentum, calls for a velocity which automatically decreases as the distance from the axis increases. Such a draft tube, therefore, provides an excellent means for recovering the energy of whirl with which the water leaves the runner and permits the water to discharge from the outlet of the draft tube with very little energy of whirl remaining in it.

[NOTE—In a later address Mr. Moody, by means of numerous lantern slides, showed the development of turbines from the old axial flow type of 1860, through the intermediate installations, to the latest high-speed large-capacity Queenston turbine now being installed for the Hydro-Electric Power Commission of Ontario. An interesting curve was presented which showed the total turbine capacity installed by years from 1890 to date, and also the maximum capacity developed in single turbines through the same period in the United States. The hydraulic turbine capacity in 1890 was 300,000 h.p., but at the end of 1921 it was 8,000,000 h.p. During this period the maximum unit capacity increased from 5,000 h.p. (original Niagara Falls Power Co. development) to 55,000 h.p. (the present Queenston development), the latter turbine having the largest capacity of any in the world today. A slide that caused much interesting comment was one which showed the development of progressive higher specific-speed runners. Three run-

ners were shown on the same scale of equal capacity, with specific speeds of 21.3, 80 and 153, the latter being the newly developed high specific-speed type. The contrast in dimensions was very marked. The final series of slides showed the very interesting process of turbine manufacture from the experimental work on model runners, through the foundry and shops, finally to the erection in the field. —EDITOR].

PORTLAND CEMENT CONCRETE ROADS*

Selection of Definite Highway System—Subgrade Problems and Drainage—Stresses in Pavement Slab—Eliminating Cracks in Pavements

By James Allen
Supervisor of Highways, Washington.

S ELECTION of types of pavement for our rural highways is a comparatively modern problem. Prior to 1905 there were but few rapid moving vehicles and these were confined largely to our city streets. The highways with gravel or macadam surfaces in those days were entirely adequate for the horse-drawn traffic and easily and cheaply maintained, and the paved streets of the cities cared for both classes of traffic in a satisfactory manner.

As the automobiles became more numerous and travelled farther afield, their usefulness increased and they changed from an experiment to an essential part of the world's transportation system. The tremendous increase in the automobile with its destructive forces, soon forced (those in charge of the highways to seek a surface for the highway that would be smooth, safe and economical. The business of farm and city grew to be dependent on the automobile and the highway, and the city dweller and the farmer became insistent that the highways be paved.

A new problem confronted the engineers, not many of whom realized that the conditions were much different than those surrounding the paving of a city street. It is well recognized now, however, that the character of traffic changes from comparatively slow moving vehicles evenly distributed over the width of a city street, to rapidly moving vehicles concentrated into two lines of traffic on the highway. The destructive forces set up by this high speed traffic have been studied and we are now measuring the forces that destroyed many of the earlier highway pavements; forces that all practical engineers recognize and prepare for in their designs.

Pavements were perhaps first made of concrete by the Romans who used a natural cement. The city of Edinburgh, Scotland, built a concrete pavement in the year 1872, and I understand it continues to give good service. Concrete was first used on this continent by the city of Bellefontaine, Ohio, for paving the court house square in 1892 and 1893, and the pavement is in a satisfactory condition. The year 1909 saw the first development of the Portland cement concrete pavement as a rural highway.

Selection of Routes

In order that a paving program may be a success, a definite highway system, designed to serve the majority of the people, must be selected, adhered to and built up by a continuing program covering a period of years. If the routes are not well selected, they must later be changed and the money spent on abandoned sections will serve for local purposes only. The people will get along with the poorly selected highways for a few years, but it is only a matter of time before a demand will develop for the most direct and practical route from the point of view of the motor vehicle operator. A highway must be safe, and it must serve the majority of the people. The location of a highway to secure the best route that the terrain affords, the most economical route, cost of operation and maintenance considered, is just as important as is the selection

of a route for a railway, and it deserves the same thorough study. Unnecessary distance and unnecessary grades are a direct tax on the people by reason of the increased operating costs. It is also essential that the grade be constructed and permitted to settle before a pavement is constructed thereon. Before a highway is paved in the State of Washington it must be graded and allowed to settle for at least two years. Obviously a pavement constructed on new embankments will go to pieces. While I am not giving much time to these subjects, they are, nevertheless of vital importance.

Subgrade

A pavement is a slab supported by the earth subgrade and in a broad way the four things to be considered in the structural design of the pavement slab are (1) the supporting power of the subgrade, (2) the climatic conditions, (3) the traffic that the pavement also must carry and (4) the strength of the pavement slab.

A good subgrade must be constant in volume, homogeneous in character and have a supporting power on which the design can be based. Many soils undergo a change in volume with the addition or subtraction of water, thereby changing the points of support of the pavement. If the soil increases in volume near the edge of the pavement only, the upward thrust will introduce unusual stresses in the pavement. Or if the soil, by reason of the loss of moisture, shrinks near the edge of the pavement, leaving the pavement unsupported, the wheels of traffic will break down this edge until it is supported by the soil. If a subgrade is not constant in volume, the design must provide for the change in the position of the support afforded the pavement. By a homogeneous subgrade, I mean a subgrade that is uniform in character. Soft spots or unusually hard spots are harmful. The pavement must be uniformly supported in order that the stresses may be equalized and distributed in all directions in the slab. If they are concentrated by hard or soft spots in the subgrade, the pavement must fail first at these points. A subgrade constant in volume and homogeneous in character must also have definite supporting power on which the design of the slab may be based.

There is, perhaps, no subject that has been written of and spoken of so often and neglected so much as the subject of drainage. The surface and ground waters must be removed away from a pavement if the pavement is to last. This is particularly true if the frost penetrates the ground more than 6 or 8 in. The upheaval of pavements due to frost action is a very common occurrence and one of the seriously harmful agencies to be understood and cared for. Good drainage and a thorough understanding of climatic conditions are necessarily a part of the success or failure of a pavement. Changes in the temperature of the concrete slab and changes in the moisture in the concrete develop forces that are to be provided for and worked with, rather than resisted. The natural forces as well as the forces of traffic must be studied and met in pavement design.

Character of Traffic Changes

It was little thought fifteen or twenty years ago that the volume and character of traffic on our modern highways would change so tremendously. The number and size of vehicles grew by leaps and bounds, as also did the loads that they carry. The five or seven passenger car grew to a twenty or twenty-five passenger bus; the one ton truck to the huge freight and logging truck of today. It seems, however, that this growth must be, and in fact it is, being controlled by legislation in the interest of the limit of our financial ability to construct pavements to withstand the loads. Without legislation to control the maximum sized truck and the distribution of its weight upon the pavement, it would be impossible to maintain our highways and reap the benefits to which we are entitled by reason of the public funds invested in the highways. Pavements, of course, can be built to withstand any given load, but the funds needed to pay for them, would bankrupt our people. I suggest that the load be limited to 18,000 lb. to

*Paper read at the Ninth Annual Convention of the Canadian Good Roads Association, Victoria, B.C., June 15-19, 1922.

any one axle and that the vehicle having four wheels be limited to 12 tons. In studying this subject, the causes of and the amount of impact must be known. Tests have been made along this line that have demonstrated the value of pneumatic and solid rubber tires and the much greater impact with solid rubber tires as compared with pneumatic tires. While the volume of traffic is important, its character is vital, and the loads must be thoroughly studied.

In the early days the stresses in the pavement slab were not calculated. The problem, being one of mechanics, involving a multitude of stresses acting from below as well as from above, justifies a vast amount of research work that is now being attacked in a scientific manner. The technical data developed regarding the character and impact of traffic and its effects on the pavement, the supporting power and reactions of the subgrade, the distribution and variations of the subgrade reactions and the stresses in the various parts of the pavement slab are technical and too involved to be discussed at this time. Progress in research is very rapid and, while it is improbable that we shall ever develop short formulae that will be adequate, it nevertheless will be possible to design an adequate and economical pavement after a thorough study of the subgrade, the traffic and the materials of which the pavement will be made.

Causes of Cracks

The ordinary defects found in concrete pavements are broken corners and cracks, both longitudinal and transverse. Pavements inadequate because of design, faulty materials or faulty construction as to ravel and break down completely, are not considered here for the reason that this condition can be avoided without any great difficulty. Broken corners, having a length along either leg of 2 or 3 ft. are serious and should be avoided by a proper thickness of slab. The corner of a slab or section of pavement has been demonstrated to act as a cantilever beam and can be designed as such, considering the maximum wheel load, impact, and the strength of the concrete. This calls to mind again the necessity of limiting the wheel load to a given maximum as a basis for design. A pavement designed to have sufficient corner strength to carry a certain traffic will be adequate as far as shearing or punching strength at other points is concerned. Transverse and longitudinal cracking cannot be so easily eliminated. These cracks are caused by stresses due to beam action in the slab, unequal expansion and contraction, due to moisture and temperature changes, frost action and unequal support afforded by the subgrade. The subject is being studied and the question arises as to how far we shall go in expense to avoid cracks altogether. At first a crack was thought to be a sign of incipient failure. Experience has shown, however, that from a maintenance and operating point of view, they are not fatal; it is still a matter of opinion as to how serious they are. There are many pavements eight to ten years old that are badly cracked and they continue to give good service, at a comparatively low cost for maintenance.

Sand is "just sand," and gravel "just gravel" to the average man. To the engineer, however, they are an important part of his work and must be thoroughly tested to determine their fitness for concrete construction. It is also necessary to test the cement and the water proposed for use in concrete construction. The possible sources of sand and gravel should be thoroughly examined before the contract for a pavement is awarded. The examination should include test holes to determine the quantity of materials available, and the sand and gravel should be thoroughly tested to determine their suitability or the possibility of washing and regrading to make them satisfactory. This information, if available to contractors, will eliminate the most extreme and risky gamble connected with pavement construction. It is also advisable to acquire the property for the development of side of the road pits, as the municipality is in a better position to purchase the land from which the sand and gravel are to be taken than is the contractor. If the property is made available to the

bidders by the organization awarding the contract, all bidders are on the same competitive basis; if, on the other hand, one contractor should acquire the property to the exclusion of all others, he can exploit his position for his personal profit, a condition that means increased costs of construction.

Good Workmanship Essential

Good workmanship must go hand in hand with good materials. The one is just as essential as the other to a good job. We have developed a system of carrying on and finishing our work that has eliminated the personal equation to a large extent. Each contractor is required to furnish a definite set of tools designed by the state and to use them in a certain prescribed manner. Each workman is thereby given the benefit of the experience of all by being supplied with tools and instructions from our engineers and they secure a first class job.

The specifications covering the details of materials and construction are quite thoroughly developed, and, under competent engineers, are getting good results. From a layman's point of view and from an administrative point of view, the thing to do is to secure the services of competent engineers and then to back them up. Specifications are only as good as the inspection. Furthermore, no matter how good the specifications, their value to the work is measured by the loyalty, intelligence, and judgment of the engineers and inspectors in charge of the work and the support given them by public officials and the public at large.

SASKATCHEWAN GOOD ROADS ASSOCIATION

FIRST annual meeting of the recently organized Saskatchewan Good Roads Association will be held at Regina on August 2. This was decided at a meeting of the provincial executive held recently. The preparation of the agenda and other details have been placed in the hands of a committee composed of the Hon. S. J. Latta, Mayor Grasse, L. A. Thornton, of Regina, and Sheriff Calder, Saskatoon.

I. A. Bowman was appointed secretary-treasurer and received instructions to communicate with Hon. S. J. Latta, as president of the Dominion Good Roads Association, announcing the formation of the provincial body and assuring co-operation to the common end.

The secretary, with Lieut.-Col. F. J. James, were appointed a committee to have the constitution printed and issued in pamphlet form, and another committee, composed of D. Laycock, Swift Current; Dr. W. M. D. Henderson, Regina, and Sheriff L. G. Calder, Saskatoon, was given the responsibility of drafting a form of bylaws for local branches.

MONTREAL PLANNING BOARD

A City Council, the proposed City Planning Board according to a by-law recently drafted by the Montreal will consist of five members, of whom two will be the director of departments and the director of public works; the three other members will be chosen from among the citizens of Montreal, and will be named by a resolution of the city council; these last three members of the board will be selected by reason of their knowledge of the art of embellishing cities.

The board will possess the powers conferred on it by the council of aldermen, but the powers will be limited to matters relating to the embellishment of the city.

All expense incurred by the board will be limited to the amounts placed at its disposal by the council, and the city will not be responsible for sums spent by the board exceeding the amounts voted by the council, and neither for sums spent by the board for purposes other than those for which the funds shall have been voted. The chief engineer of the city will be the engineer of the commission.

CONTROLLING QUALITY OF MATERIALS IN HIGHWAY CONSTRUCTION*

Field and Laboratory Tests—Methods of Obtaining Samples—Testing Materials for Concrete—Control of Cement Concrete—Standardizing Tests

By John H. Bateman

Director, Michigan State Highway Laboratory.

HIGHWAY construction and maintenance are affected by a great many factors, all of which are of more or less importance in the successful prosecution of work. Leaving out of consideration administration and financing, and considering the items of construction and maintenance, we may quite properly consider two factors which are necessary to attain good results, namely, good workmanship and a good quality of materials. The inspection of construction and maintenance work deals to a very large extent with these two factors and the careful inspection of both is necessary to insure good work. The necessity for this inspection may generally be considered as due to three principal causes: first, an intent on the part of the construction organization or the producers of materials to actually do poor work or furnish low-grade materials; second, carelessness on the part of the employees, and third, ignorance of the work, due to unfamiliarity or lack of training or experience. The first of these reasons is probably responsible to only a small degree for the necessity of careful inspection of materials. The latter two reasons are probably responsible in a much higher degree for the presence of a poor quality of material on any work.

Under inspection of materials we should also include the necessity or desirability of the work of controlling the proper use of these materials.

The control of quality of materials in highway construction and maintenance, as in other forms of construction and maintenance work, is of a two-fold nature involving both laboratory methods of examination and field testing. These two factors are not distinctly separate operations, but are bound together by reason of the nature of the work, and the successful control of materials depends entirely upon the proper relationship existing between a laboratory and field inspection forces.

Laboratory methods of examination in many cases are necessary because of the difference in methods of analysis of the many materials entering into the construction and maintenance of highways. In the case of many materials, proper examination consists of both laboratory and field work. A brief description of some of the more important tests of various materials may be used to illustrate this relationship.

Portland Cement Tests

We are all familiar with the various tests of Portland cement which have now been adopted as standard over practically the entire country. These tests must necessarily be conducted under rather strict conditions as to apparatus, temperature and other working conditions and make laboratory examination a necessity. The examination of Portland cement involves tests which may be grouped into three classes as far as the element of time is concerned. First, we have those tests which may be completed within a period of twenty-four hours; second, strength tests which may be completed at the end of seven days, and third, strength tests which may be completed at the end of twenty-eight days. Portland cement is usually required to pass all of these tests satisfactorily, but on account of the long time intervening between the beginning and completion of all of the tests, it has usually been the custom to provide for the acceptance of Portland cement on the basis of twenty-four-hour or seven-day tests, either tentatively or entirely reserving the right to require in one case seven and twenty-

eight day tests, and in the other twenty-eight day tests in case the cement fails on either seven-day or twenty-eight-day tests after having passed preliminary tests referred to.

Laboratory Tests

In the examination of sand, gravel, crushed stone and crushed slag, the services of a laboratory may properly be made use of most especially in the examination of preliminary samples. After the quality of these materials has been definitely determined and proper control may well be said to be a duty of the field inspector.

The examination of ledge rock, on account of the character of the tests involved, makes laboratory tests a necessity. The tests ordinarily conducted to determine physical qualities are: hardness, toughness, abrasion and compressive strength. These tests all require more or less expensive and heavy machinery which, for economy, must be located in a rather extensively equipped laboratory. After the quality of a certain product has been determined, further tests are not usually necessary within a period of one year's time of making the initial tests in those portions of the quarry at which operations are being carried out.

Proper inspection of paving brick involves the utilization of machinery which may only be properly installed in a laboratory, either at the plant itself, or in a central laboratory for the examination of such materials.

The quality of asphalt and tar products also involves the utilization of a properly equipped laboratory on account of the exacting methods of analysis required in this industry. The relationship between laboratory and field examination will be touched on later in this discussion.

In addition to these materials we have others, such as structural and reinforcing steel, corrugated metal pipe, paint, etc., which represent materials for which laboratory methods of examination are necessary.

As I have stated before, the proper examination of materials involves both laboratory and field methods. Most of us are familiar, at least to a certain extent, with the various methods utilized in the laboratory. Many recent developments, however, in the connection with desirable field control of materials are of particular interest and value at this time. It is my purpose to describe some of these various methods in an attempt to point out their value and the relationship which should exist between field and laboratory inspection with various materials.

Sampling Materials

Field work involves one of the most important of the operations in connection with all testing. I refer to the matter of sampling materials. It is perfectly evident to all of us that the proper interpretation of results of tests conducted, either in the field or in a laboratory, is necessarily dependent upon the method which has been used in obtaining the sample for examination. It may not be amiss to describe, in connection with various materials, some features of sampling which must be carefully observed in order to insure obtaining test results which are representative of the bulk of the material sampled and tested. In this connection we may refer to three features as the principal factors which must be observed in connection with sampling operations; first, the method of sampling must be such that the sample taken represents as accurately as possible the bulk of material sampled; second, the size of the sample must conform to the quantity of material necessary for conducting tests, plus an extra quantity to retain for reference purposes; and third, the container to be used in transmitting the sample of material from the point of sampling to the laboratory must be of satisfactory kind and size.

Cement Samples

Portland cement is used in very large quantities in both highway construction and maintenance. The necessity for careful sampling is quite evident on account of the method of manufacture and shipment of this material. It is now generally recognized that a sample of Portland cement should be taken from every 200 to 250 barrels of mat-

*Paper read before the Eighth Annual Conference on Highways Engineering at the University of Michigan on February 14, 1922.

erial, this quantity being approximately that contained in one car load. Portland cement is shipped in cloth or paper sacks, or in bulk. In taking samples for shipments in sacks, a small amount, let us say about $\frac{1}{2}$ lb., should be taken from each of about twenty sacks selected at random from a carload or an equal amount of cement. It is not necessary to open up the sack of cement to obtain the sample. A small valve is placed in the end of both cloth and paper sacks to be used for filling by means of the automatic sacking machines now generally used in all Portland cement plants. A small sampling tube may be inserted through these valve openings and the necessary quantity of cement obtained in this way without disturbing the sack itself. In the case of bulk shipments of cement, the most satisfactory method of sampling is by means of sampling rods with which we may be sure to reach all parts of the material. Cement samples may properly be shipped in closely woven canvas bags. The quantity actually required for testing is approximately five to six lb. and samples should preferably contain from 8 to 10 lb. of material.

Sand Samples

Sand samples should consist of about 20 lb. of material and should be obtained by taking small portions of material from various parts of the supply represented and combined to form a test sample. Samples of gravel and crushed stone should be taken in similar manner about 30 or 40 lb. of material constituting a proper size sample. These samples may be transmitted in canvas bags or tight boxes.

Stone Sample

General experience seems to teach us that a great deal of difficulty is usually obtained in securing representative samples of rock from ledges in quarries. As a first consideration rock should preferably be sampled by taking samples from all the different formations within the quarry. In some quarry examinations conducted for the Michigan State Highway Department the speaker has selected as high as 25 or 30 samples to determine the entire range of the material in a given quarry. Samples of ledge rock should consist of about forty pounds of material larger than $1\frac{1}{2}$ in. in size. At least one piece of material should be approximately 5x5x4 in. to enable cores to be drilled with a diamond drill for the hardness and toughness test. Owing to the nature of the material these samples should preferably be enclosed in tight boxes rather than shipping them in sacks which usually become destroyed or damaged in shipment.

Paving Brick

In the case of paving brick, samples should be taken which accurately represent one lot or shipment of the brick. One sample should be taken to represent the softer brick in each load or shipment, and another sample to represent the hardest brick. In addition, a third sample representing the general average of the material should be selected. Twelve paving bricks should constitute a sample and should be shipped in a box, or crate, preferably in rows with a partition between each six bricks.

Asphalt

Asphalt and tar products, if sampled from tank cars, should preferably be sampled at the time of loading in order to secure truly representative samples. When this is done, portions of the hot material may be taken at intervals during the loading of the car and combined to form the test sample. When sampling from drums or barrels, samples should be taken from a number of drums or barrels in each load or shipment, and combined to form the test sample. In the case of hard products care should be taken to reach the interior of the material and not to include the surface skin, together with any foreign material which may have become adhered thereto. Care should also be taken not to take samples in these cases from material exposed to the weather, and on which free water is standing. The sampling of corrugated metal pipe should preferably be performed at a fabricating plant, but owing to the intermittent shipment of these products, such a procedure is useless un-

less central purchasing in large quantities is generally practiced. When samples are taken after pipe has arrived on the ground, it is necessary to use a heavy pair of metal shears, or a hack saw to remove the sample. On account of the work involved, and the danger of damage to the sample, field methods of testing are particularly desirable in the case of this material. A field method of testing these products has already been devised and it is the writer's opinion that its use will be more generally adopted in the future. The necessity for the use of glassware and chemicals is an objection to carrying such a testing outfit in the field.

Testing in the Field

In the field testing of materials, these various features in regard to sampling are just as necessary and should be followed out as carefully as when taking samples which are to be sent to a central laboratory.

The testing of materials in the field is naturally confined to those tests for which equipment may readily be manufactured which is comparatively inexpensive and easy to transport, and to those tests which do not require strict conditions of temperature or methods of analysis which can only be carried on in an enclosed room under exacting conditions. As stated before, the testing of such material as Portland cement is a laboratory process. Sand, gravel, and crushed stone may, however, be examined in the field with a good deal of efficiency.

Field Testing Sand

The testing of sand in the field is of considerably more importance than is generally recognized, both in connection with preliminary tests and with the control of materials from known sources of supply. The tests which are ordinarily conducted on sand are tests to determine cleanness, both as to organic matter and clay content, size and grading, and strength in mortar. The latter test is essentially a laboratory test. The size and grading of sand may readily be determined by a set of field screens and sieves. The determination of quantity of clay and silt in sand may readily be made in the field on a volume basis by selecting a sample of the material, mixing it thoroughly, and cutting it down to a size suitable for testing. This small sample is then placed in a graduated glass cylinder together with water, and the whole vigorously agitated without whirling. The percent of clay and silt, by volume, may then be determined by measurement of this material which is in the upper part of the cylinder and which may be readily noted by the eye.

It is the writer's opinion that the determination of organic matter in sand is one of the most important tests that may be applied to this material. The relationship between organic content and decrease in strength of both mortar and concrete has been quite definitely determined, and the low strength of concrete, in many instances, may be traced directly to this particular feature of the sand. Small variations in the properties of Portland cement and other features of aggregates are of insignificant importance if organic matter is present in the sand in any considerable quantity. Fortunately this quality of sand may be determined in the field by a comparatively simple method. The test as it is usually made consists of thoroughly digesting the sand with a 3% solution of sodium hydroxide and observing the resultant color of the liquid above the sand after the mixture has been allowed to stand for a few hours. This procedure may be briefly described as follows: A 3% solution of sodium hydroxide may be made up by dissolving one ounce of sodium hydroxide (obtainable at any drug store), in enough water to make 32 liquid ounces. Fill a twelve ounce graduated prescription bottle to the $4\frac{1}{2}$ ounce mark with sand to be tested, add the 3% solution of sodium hydroxide until the volume of the sand and the solution, after shaking, amounts to seven ounces. The mixture should be shaken very thoroughly and allowed to stand for 24 hours. If the solution resulting from this treatment is colorless, or has a light yellowish color, the sand may be considered as practically free from organic impurities and satisfactory for use insofar as this quality is concerned. If, on the other hand, a dark brown colored

solution is obtained, the sand should not be used for concrete aggregate. The time indicated above, of 24 hours, is usually the standard time allowed for settlement of the solution. A very good idea of the character of the sand, however, may be obtained in a much shorter period.

The size and grading of gravel and crushed rock may be obtained very easily by means of a compact set of field screens and sieves.

Testing Water for Concrete

Occasionally one desires to use a source of water for concrete which appears questionable. While it is true that in the State of Michigan we seldom encounter unsatisfactory supplies of water, nevertheless, simple tests can be made in doubtful cases to determine whether any supply is objectionable. Strips of red and blue litmus paper can be used by inserting them in the water for a period of five minutes and noting the color produced. A marked reversal in color indicates the presence of acids or alkalis, and makes further laboratory tests advisable. Laboratory tests usually consist of determination of total solids and quantity of organic matter present, or a comparison of the given water with a water of known satisfactory quality by making standard tests of a sample of cement which is known to be satisfactory.

Control of Cement Concrete

An important part of the work of field control of materials is in connection with the control of cement concrete entering into either concrete pavements or other concrete structures such as bridges, culverts, retaining walls and other similar structures. Due to the large amount of investigative work which has been completed in the last two years, we know a great deal more about the importance of certain features in connection with the manufacture of cement concrete than was the case a few years ago. Time of mixing, method of curing, and the consistency of concrete are now recognized as among the most essential elements affecting the finished product. Time of mixing and method of curing may be easily controlled by the field forces on a construction project.

Consistency or the percent of water in concrete is another item which has often been neglected in the past, but which is now receiving more careful attention on the part of both construction organizations, such as contractors, state and municipal forces. We know, beyond a doubt, that a dry concrete is much stronger than a wet concrete, all other conditions being equal. Two methods have been devised for determining the consistency of concrete, only one of which is readily adaptable for use in the field. This method is known as the "slump" test and is conducted by placing concrete, fresh from the mixer, in a metal mould 12 in. high, 8 in. in diameter at the bottom and 4 in. in diameter at the top. This form is placed on a level and preferably a non-absorbent surface, such as a metal plate. The concrete is placed in the open end in approximately three layers, each layer being rodded with a $\frac{1}{2}$ -in. or $\frac{3}{4}$ -in. steel rod, preferably pointed at the end. After the form is filled, the rod may be used to strike off the concrete level with the top of the form. The form is then carefully removed by raising it in a vertical direction, and the distance which the concrete slumps down, or in other words, the difference between 12 in. and the remaining height of the concrete after the form is removed, generally denoted as the "slump," is considered as a measure of the consistency of the material. The entire apparatus for this simple field test can be obtained at a cost of two or three dollars, and if kept properly cleaned, may be used for several seasons.

Tests of the concrete itself may be conducted in a laboratory by taking specimens for tests of compressive strength, wear or cross breaking strength. Probably the most logical test to use is the one involving the cross breaking strength of the material. This test, however, unless laboratory facilities are provided very close to the work, is impracticable on account of the necessarily large size of the specimen and the cost of transporting it to

the laboratory. Compressive strength tests or tests for wear have generally been utilized to a greater extent.

Plant Testing

We have referred to the general plan of laboratory testing. Laboratory testing may be conducted in a central laboratory or in a temporary laboratory connected with or near the manufacturing plants at which the materials are actually produced. Plant testing depends to a great extent upon economy in connection with such procedure. When an organization is obtaining a large volume of the products of any given plant it may often be economical to test the product of the plant itself. This method is by far the most convenient one on account of the fact that the quality of materials can usually be determined, and results of tests made known on the job prior to shipment or receipt of the material. In this connection the testing of Portland cement offers one place where plant testing may often be followed economically. The use of aggregates of either sand, gravel or crushed stone on a large scale always makes it desirable to follow up inspection of these materials at their source. As in the case of Portland cement these materials can readily be tested at the plant, and their quality determined prior to shipment. In connection with aggregates it is extremely important that the plant inspector actually inspect the loading of each car of material.

Bituminous materials such as asphalt cement and various tar products may also be properly tested at plants.

Where plant testing is not followed it is desirable, in the case of such materials as Portland cement, asphalt and tar, to station samplers at these plants and have samples taken at the time of shipment, which may be transmitted to a central laboratory and test results obtained as soon as possible after receipt of the samples. Plant samplers in these cases usually consist of men who do this work in addition to some other duties.

In the case of large organizations embracing a rather large area of territory, the establishment of branch laboratories in connection with the main laboratory for testing materials may be followed out economically, and will serve to measurably increase the facilities for the inspection of materials. As an illustration, we may take the work of the Michigan State Highway Department, which is scattered over a large area. On account of the fact that the Upper Peninsula is situated so far from the seat of government, and the location of the State laboratory, a branch laboratory located at some city in the Upper Peninsula should work out as a very convenient and necessary arrangement. In addition a branch laboratory for the upper portion of the Lower Peninsula would likewise appear to be desirable. It is quite possible that some such arrangement as this may be worked out in the very near future.

Re-Testing Materials

In connection with the examination of materials it may be well to consider one phase of the subject which possibly, in the minds of some of you, is misunderstood at the present time. I refer to the matter of re-testing of materials, which on original test have failed in some one or more particulars, and particularly to the case of Portland cement.

We have already discussed the various properties of Portland cement, dividing them into three classes according to the time necessary to complete tests. These properties may also be divided into two other classes; into one of which we would place those properties which are unchangeable, or very nearly so, in their nature; into the other class we may place those properties of cement which may undergo changes. Under the first classification we have such properties as fineness, and to a limited extent, tensile strength of standard mortar. In the second classification we may place the properties of time of setting and soundness.

When a cement upon original test fails on fineness it does so because of the fact that the material is not ground finely enough to meet the requirements of the standard specifications for size of particles. This property is

changeable only to a very slight extent and hence rejections on this property do not warrant re-testing of cement unless sampling has been performed in an entirely unsatisfactory and improper manner.

If a cement fails on time of settling or soundness, the user, if he desires to hold the material for a re-test, may properly request that another sample be taken and tested from a certain load or shipment which has previously failed on either or both of these tests. The user, whether a contractor or an organization, whichever the case may be, must necessarily resume all the responsibility for the cost of holding the material for this re-test.

In the case of failure of cement due to low tensile strength, a considerable amount of time is necessary in order to complete a second test. Therefore, the matter of economy enters very materially into the question of re-testing.

Laboratory Administration

It perhaps may not be out of place to refer to some features in connection with the administration of laboratory work.

On account of the fact that laboratory tests of materials involve shipments of considerable value, it is absolutely essential that the work of testing be carried on by efficient workmen, thoroughly trained, and performing their work according to certain definitely outlined methods. Methods of examination of materials used in highway improvement have been largely the result of work done by organizations such as the U. S. Bureau of Standards, U. S. Bureau of Public Roads, The American Society for Testing Materials, The American Society of Civil Engineers, and other like organizations. At the present time the testing of these various materials has been placed on a more or less of a standard basis, and the work of testing carried on throughout the country is rapidly becoming more and more standardized, using more uniform methods.

It may readily be seen that extreme accuracy is necessary in the conduct of this work, and that an error due to lack of training or carelessness is very much more serious than often is the case in connection with construction work itself. For this reason the training of men engaged in this work becomes of paramount importance.

In the laboratory of the Michigan State Highway Department, both technical and non-technical men are utilized in the examination of materials, each working in the sphere for which he is particularly fitted. Operators on Portland cement who conduct physical tests only are not permitted in the case of such tests as time of setting, soundness, and tensile strength, to perform routine tests until they have passed through a period of training of from two to three months, working under the direction of experienced men. In many cases this period has actually, on account of existing conditions, been extended to far greater periods. The same is likewise true with reference to other materials and every effort is made, in the cases of failure, to meet certain specification requirements, to carefully ascertain by means of check tests that the results obtained are correct.

The work of the testing laboratory is not confined entirely to the routine testing of materials. Many other duties are part of a laboratory's responsibility. In addition to the routine testing of materials it should be the duty of a laboratory to assist in the proper usage of materials, to aid in the advancement of knowledge of materials, by conducting investigations and work of a research nature, and by assisting in ascertaining and recording the extent and properties of local materials available for use; also by assisting in the preparation of specifications for materials. It should also be the duty of a laboratory to keep a record of materials tested in such a way that at any time the nature of materials entering into any given portion may be quickly and accurately determined. Last, but not least, the utilization of a laboratory in the training of employees in the use of materials is most certainly a valuable and essential part of its work. This function of the laboratory cannot be measured in the number of tests conducted, or quantity of material represented by tests, but is

nevertheless a very important service to public organizations.

The co-operation of a central testing laboratory with field forces, involves not only accurate and speedy service on the part of the laboratory, but a willingness to assist field forces in every way possible. The administration of laboratory work along these lines is essential to the efficiency of the organization with which it is connected to insure the obtaining of materials of proper quality, the proper usage of materials on work, and the recording of data of value to the organization it serves.

GOOD ROADS CONVENTION AT VICTORIA

ENTHUSIASM marked the opening session of the ninth annual convention of the Canadian Good Roads Association at Victoria, B.C., last week. The convention brought together engineers and officials from every province in the Dominion and many prominent highway engineers from the United States. Hon. S. J. Latta, in his presidential address, declared that human necessity and traffic requirements should be the guiding principle in the selection and location of a system of highways, rather than adherence to an artificial system of straight lines. To this end, the following details should be considered: The greatest good to the greatest number, most direct route possible for traffic, avoidance of sharp curves, advantages of easy grades, minimum construction cost, economy of maintenance, correlation of each road selected and located to all other portions of the whole system, relation of the road as a feeder to the railways, drainage facilities, proximity of road material, future requirements, necessity for bridges and culverts, money available for the project proposed.

Hon. J. L. Perron, Minister of Highways, Quebec, expressed the pleasure of Quebec officials at being present at the convention. They were greatly impressed with the wonderful possibilities of British Columbia.

S. L. Squire, past president, and member of the advisory committee, spoke of the great purpose of the association in order to carry out the principles and objects for which delegates were prepared to travel many miles to discuss with their brother Canadians. Six hundred million invested in highways in Canada must be protected. Fifty millions have been wasted by municipalities in road experimenting. There is need for strict economy, but we also need more and better roads, and in the building of these must be as liberal as possible.

At the opening session on Tuesday, A. W. Campbell, Chief Commissioner of Highways, Ottawa, addressed the convention. He said that it would be only a few years before every section of the Dominion would have all the permanent roads required. There are 18,000 miles of main roads in the various provinces and in due course these would be linked up, so that there would be a main highway across Canada. No one section of Canada, he said, was progressing more than another, but all were making headway in road construction.

Addresses were also given by G. P. Graham, engineer, of Albany, N.Y.; A. W. Campbell, chief commissioner of highways, Dominion Government, Ottawa; and J. C. Robertson, deputy minister of public works, Alberta.

In the afternoon the officers for the ensuing year were elected. Hon. J. L. Perron was elected president. The other officers are: Honorary president, Hon. S. J. Latta, Regina; first vice-president, Russell T. Kelly, Hamilton, Ont.; second vice-president, E. L. Follows, Vancouver; secretary-treasurer, G. A. McNamee, Montreal.

The following directors were elected: Mayor Beaubien, Outremont, Que.; H. S. Carpenter, Regina; William Finlay, Toronto; George Hogarth, Toronto; J. D. Robertson, Edmonton; P. Hillis, Victoria; S. H. Henderson, Winnipeg; G. Fred Pearson, Halifax; R. D. Patterson, St. John; A. M. Hankin, Collins Bay, Ont.; T. J. Mahoney, Hamilton; H. H. Shaw, Charlottetown; J. A. Duchastel, Montreal; P. Gomny, Vancouver; R. P. Murray, Halifax.

PRESENT TREND OF HIGHWAY DEVELOPMENT

Joints for Brick Pavements—Flexible and Semi-Flexible Types of Pavement Predominate in Highway Construction—More Attention Being Paid to Drainage

By Prevost Hubbard,
Chemical Engineer, The Asphalt Association

DURING the construction of our state and county highway systems, it is an almost incomprehensible fact that more weight has not been attached to paving practice in our cities where many of the problems of meeting heavy and varied traffic conditions were successfully solved before such conditions made their appearance on country and suburban highways. In our cities the original waterbound macadam and gravel roads have for the most part given way to higher types of construction until today they constitute an average of only about 26 percent of the total yardage. The three most most widely used city types are asphalt, brick and stone block. If we eliminate the waterbound pavements we find that of the higher city types, asphalt constitutes about 55 per cent, brick about 19 per cent and stone block about 14 percent, giving a total of 88 percent for these three types.

Flexible Joint Filler

In connection with the preponderance of asphalt pavements, the present trend of paving practice in the construction of modern brick and stone block pavements is of considerable significance, as it recognizes a principle which just now is attracting a great deal of attention on the part of our highway engineers. I refer to the use of a flexible joint filler for brick and block pavements as against the rigid grout fillers, formerly so popular. Such cities as New York and Philadelphia are now using asphalt fillers for heavy traffic streets with stone block and the Paving Brick Manufacturers Association are preferentially recommending asphalt as a filler for their type of pavement. The reason for this lies in the fact that absolute rigidity in a pavement structure is not a desirable characteristic. Service results and comprehensive field tests conducted by the U. S. Bureau of Public Roads, have demonstrated that the brick or block pavement with a flexible filler is more resistant to traffic than with a rigid filler. A certain degree of flexibility is highly advantageous in meeting the heavy impact of modern traffic. Such flexibility is an inherent characteristic of bituminous pavements and is imparted to brick and block pavements when asphalt is used as a joint filler.

Flexible Types of Construction

While in certain sections of the country the experience of our cities appears to have been overlooked, it is a fact that the flexible or semi-flexible types of construction predominate in our country roads and if we consider the total mileage of state, county and municipal highways higher than gravel and macadam, considerably more than 50 per cent may be so classed. By reducing all yardage to a basis of 16 ft. width, we estimate that at least 45 percent of the mileage of the higher types of pavements are of the hot-mixed asphalt types. The latest available information indicates that last year the total area of asphalt pavements constructed approximated 68,000,000 sq. yds., which was greater than for any other type. Most of the stone block pavements constructed that year were filled with bituminous material and about 60 percent of the brick pavements were similarly filled.

There are, it is true, many advocates of the all rigid monolithic types of construction and in certain sections such pavements predominated in last year's work. This is not true, however, of the country as a whole. Those who favor rigid construction have constantly been obliged to increase the massiveness of design of such pavements and also the amount of reinforcement in an endeavor to successfully meet the destructive action of heavy traffic, while those who have favored the semi-flexible or flexible types have, in general, found that the old standards of design

have proven satisfactory. The all flexible types, such as the black base pavements so extensively adopted in our far western states appear to be the most highly resistant per inch of total thickness, and may therefore be considered the least massive and in this respect the most efficient of the heavy traffic pavements.

It is probable that such pavements will be given considerable attention in the 1922 program of some of our eastern states owing to the remarkably satisfactory results obtained over a long period of years in the west. Many of these pavements are 6 in. or less in total thickness.

Instances of Satisfactory Service

What we have learned in the last few years about the destructive effect of traffic impact and the resistance of impact offered by semi-flexible and flexible highway structures, has a peculiar significance in connection with a great economic problem, that of conserving our investment in old roads, particularly gravel and macadam, when it becomes necessary to adopt a higher type of wearing surface. Prior to the careful investigation of this important subject there existed a marked and growing tendency to discredit the use of old gravel and macadam roads for foundation for the higher types and this in spite of many remarkable service records of macadam foundations. For example, in the City of New York, a number of the most heavily traveled streets were constructed years ago on macadam foundations and some are still giving satisfactory service. In 1890 Broadway, between 59th and 79th streets, was paved with asphalt over an old macadam base and for 22 years gave good service. Its replacement at the end of this period was largely due to subway excavations. Seventy-second street, paved in a similar manner, also gave 22 years of service under increasingly severe traffic conditions and the same is true for a 19-year period for Fifth Avenue between 110th and 120th streets. Lenox Avenue between 110th and 124th streets was surfaced with asphalt over old macadam in 1914 and is still giving good service. The cost of maintaining this section in 1919, 14 years after construction, was only one per cent, certainly a remarkable record. Many similar cases might be cited from various localities.

A recent investigation of rolled stone bases for brick pavements was conducted by the U. S. Bureau of Public Roads and A. T. Goldbeck of that Bureau has published a very favorable report on this type of brick construction. All in all it appears that the old waterbound base is again coming into its own.

Inadequate Drainage

One reason for much of the former dissatisfaction for such bases was undoubtedly due to a fault which has been all too prevalent in the rapid development of our country highway system. I refer to inadequate preparation and drainage of our subgrades, fostered by the false idea that the cost for such work would make the total cost prohibitive. Political pressure and popular demand for the rapid construction and the greatest possible mileage of improved roads for a given amount of money has been, to a great extent, responsible for this state of affairs. However, this subject is receiving an increasing amount of attention and is being most carefully investigated by the Government and a number of public service bodies and technical societies, the work of the various organizations being correlated by the Advisory Board on Highway Research of the National Research Council. Most of our highway engineers are now fully alive to the importance of this subject and marked improvement in our present practice of subgrade preparation and drainage will shortly follow.

There is one other common fault in the utilization of old roads for foundations which has often resulted disastrously. This is the over estimation of thickness of the old road. All too frequently we have laid an expensive pavement on an old road, actually 3 in. or less in thickness when it had been estimated as not less than 6 or 8 in. thick. Macadam and gravel roads wear away very rapidly in comparison with other types because records show that

a large tonnage of road metal has been used in the construction and maintenance of the old road, it does not by any means follow that most of such material is still on the road. It is very essential, therefore, to determine accurately the existing thickness of the old road before utilizing it as a foundation.

Wherever possible the old road should be left undisturbed rather than to scarify and reshape it, which destroys much of the stability that compression under traffic has brought about. It is quite necessary that the old surfaces be trued up before the wearing course is laid, but if the reconstruction is to be completed in one operation, the placing of a bituminous mixture in existing depressions will usually prove to be the best practice. If the existing road is not sufficiently thick to serve as a foundation, it may conveniently be reinforced with a thin course of black base mixture before the wearing course is laid.

HYDRAULICS OF PIPE LINES

Reviewed by Thos. H. Hogg,

Assistant Hydraulic Engineer, Hydro-Electric Power Commission of Ontario.

HYDRAULICS OF PIPE LINES—By Dr. W. F. Durand, Professor of Mechanical Engineering, Stanford University, California. (The Glasgow Text Books in Civil Engineering, edited by G. Moncur, Professor of Civil Engineering in the Royal Technical College, Glasgow.) New York: D. Van Nostrand Co. Cloth; 6 by 9 in.; pp., 271; 134 line cuts. \$4.50.

This treatise is evidently not intended as a complete discussion of the subject of pipe line design, but nevertheless treats the question rather fully from the descriptive as well as the mathematical or analytical standpoint.

The first chapter deals with the hydraulics of flow in pipes, presenting in brief form certain of the formulae for determining the loss of head. Head losses due to bends are fully treated, while valves and sudden enlargements follow the stereotyped method of treatment of the standard hydraulic textbooks.

Chapter II presents the surge problem and this is probably the predominant feature of the book. Only the analysis of the simple tank is given, and attention is drawn to the fact that the simple tank is not necessarily cylindrical in shape.

It is unfortunate that the question of the differential surge tank is so inadequately treated, being dismissed with a reference to the available literature on the subject. No engineer is justified in ever using the simple tank, for the differential tank has all the advantages and none of the faults of the former. It is safe to predict that in a comparatively few years, when engineers are educated to its use, that the differential tank will entirely supersede the simple tank, which, by the way, is simple only in name.

Water hammer in pipe lines is treated at length in Chapter III, and here again one is inclined to be critical. The work of N. R. Gibson in the analysis of pressure rise in pipes due to slow closing of valves or gates is probably the only adequate treatment in English, yet this work is not referred to, although it may be noted that Mr. Gibson's method of treatment is used by the author.

The chapter on the stresses in pipe lines is very adequately treated; there is also a chapter on materials, construction and design; and also one on oil pipe lines that should prove of interest to many engineers.

It is with a feeling of regret that one closes the book. The treatise might have been made most complete and authoritative if proper space had been allowed for the recent work of other engineers in connection with the analysis of

the surge tank, and of pressure rise. These two phases of pipe line flow are undoubtedly the most important, and the book as it stands treats these subjects in a very inadequate manner in the light of present-day practice.

DEEP HOLE AND SUBMARINE DRILLS. Form K-216, Canadian Ingersoll-Rand Co. This pamphlet is devoted to an illustrated description of the class "H-66" deep hole drill as used on the Chippawa Power Canal and other important engineering works. Details of construction are included.

THE LUBRICATION OF AIR COMPRESSORS. Form K-325. This is a 12-page pamphlet containing a copy of the practice recommended by the Compressed Air Society, the paper itself being written by H. V. Conrad, M.E., former secretary of the society in question. This pamphlet, which is issued by the Canadian Ingersoll-Rand Co., will be of undoubted interest to those who have to do with the operation of air compressors for all kinds of service.

CANAL STATISTICS, 1921. This report which covers the year ending December 31, 1921, containing 54 pages, comes from the office of the Dominion Bureau of Statistics, Transportation Branch, and contains some very interesting information regarding the freight prassing through the various canals throughout Canada. It also gives a good deal of information regarding the location and description of the various canals, grain shipments, historical tables, etc., all of which makes the publication of very great interest to those who are concerned with water transportation matters.

THE PYRAMID. We have received a copy of this new publication which has been issued by the Vitrified Clay Publicity Bureau. The leading article explains the basis upon which the "Pyramid" is built and outlines the object of its publication, namely, to give out from time to time, facts concerning the history of clay products; changes that have taken place; their present-day manufacture and their modern application. The publication is printed on coated paper, tastefully illustrated and contains fourteen 5 x 7 1/2 in. pages. All those who are in any way interested in the use of vitrified clay products will find many helpful suggestions in this new publication.

EMPIRE MUNICIPAL DIRECTORY AND YEAR BOOK, 1922-1923. The 40th edition of this well-known year book contains a complete list of all the corporations, county, urban and rural districts, not only in Great Britain and Ireland but in the overseas Dominions, and is recognized as a most useful work for reference purposes. A most complete directory of municipal and sanitary engineering equipment is included, and altogether the 1922-23 edition excels all preceding issues insofar as the reference value of the publication is concerned. It contains nearly 300 pages and is published by the "Sanitary Record" London, England, and sells for 10/6, net.

ASPHALT PAVEMENT CONSTRUCTION. The Texas Company, New York City, issue from time to time a number of very useful, well illustrated booklets on different types of asphalt pavement construction.

This series includes booklets on sheet asphalt, asphaltic concrete, asphalt macadam, asphalt filler, asphalt to resurface worn brick, and asphaltic road oil. In addition this company has for distribution a portfolio, entitled, "What Is Your Highway Problem," which gives a brief resume of the facts of each highway construction use to which asphalt is put.

All who are interested in the design, construction and maintenance of pavements will find much to interest them in these booklets and anyone desiring any of them, may very readily secure copies by addressing a brief request to the Asphalt Sales Department, The Texas Co., 17 Battery Place, New York City.

RAILWAYS AND HIGHWAY TRANSPORT.

SPEAKING at the annual meeting of the National Highway Traffic Association recently held in New York, Professor Arthur H. Blanchard, of the University of Michigan, pointed out the vital relation of highway transport to the railways. There are some railway operators who unfortunately have viewed the highway with hostility, but the attitude of friendliness is becoming increasingly common. Progressive railway managers realize the vital importance of highways as feeders to the railways, and, in many cases, have adopted highway transport to a greater or lesser extent as an auxiliary.

Numerous methods of employing highway transport for the more effective carrying out of the function of the railway have been adopted. There is, for example, the inter-terminal transportation of freight by motor trucks carried out in a successful manner in such cities as Cincinnati. There is the intra-terminal and freight yard highway transport involving the transferring of commodities to shipping platform and warehouse. There is the collection and delivery of freight in municipalities adjoining areas. Notable examples of this are to be found in Great Britain, where, in the case of the London and North Western Railway, 350 motor vehicles were operated in 1920. Again, there is the possibility of extending the transportation service of the railway through the medium of motor truck and motor bus routes. Instances of extension of the service of electric railways in this manner are already common in Canada, but a much higher development of the system in connection with steam railways has been attained in Great Britain.

It is interesting to note that the same modification or attitude of the steam railway to highway transport is occurring as has been seen in case of the electric railway and highway traffic. The electric railways now frankly admit the value of motor bus and motor truck service as an auxiliary and the steam railways are undoubtedly coming to the same point of view.

TECHNICAL GRADUATES IN RAILWAY WORK

AS a result of an analysis of the personnel of the Pennsylvania Railroad, Samuel Rea, president of the system, recently stated that of the 163 principal officers and directors of the system, there are 86 college graduates. However, since for every 100 men entering the service with a college education, there are thousands who start without one, Mr. Rea concludes that the college graduate has a much greater chance of reaching a position of great responsibility in railroad work than has the young man without such advantage.

Of special interest to the engineer is the fact that the company's statistics show that the most advantageous courses are those in civil engineering and mechanical engineering. Out of the 163 leading officials already mentioned, 81 are in the operating department and of these 81, no fewer than 54 are college trained men. Of these 54 college men, 38 are civil engineers, 11 are mechanical engineers, one is an electrical engineer and 4 are graduates of academic departments. If the analysis were made of the younger operating officers, who in a very short time will be in charge, consequent on the retirement of many officials now reaching the retiring age, it would be found that nearly all are college graduates.

Such a conclusion as has been reached by Mr. Rea goes a long way toward counteracting the somewhat discouraging views respecting university education expressed by Thomas A. Edison and others of his school. In spite of the fact that college graduates may be right only 60% of the time, as stated by Mr. Edison, the great corporations and important governmental departments are persuaded that a university education is well worth while.

VALUABLE WORK OF THE ONTARIO BOARD OF HEALTH

OUTLINING the activities of the Ontario Board of Health since its establishment, F. A. Dallyn, sanitary engineer for the board, pointed out at the recent meeting of the Canadian section of the American Water Works Association, many particulars in which the board is contributing to the welfare and health of the people of Ontario. For example, it was stated that whereas in 1910 the death rate per 100,000 population from typhoid was 22 in the counties, it was in 1920 6.2; in the cities it dropped from 51.5 to 5.5 in the same period; in the towns from 56.4 to 25; and for the entire province from 31.5 to 7. No more striking proof of the valuable services of the provincial health authorities could be given.

Outlining the policy of the board, Mr. Dallyn pointed out that its function was purely supervisory. It did not undertake to solve the problems of municipalities, and aimed to give considerable latitude so long as the sanitary welfare of the community was properly conserved. Such a policy, we believe, is a sound one. As was pointed out, the funds at the disposal of the board do not permit it to delve deeply into municipal situations, and, it is doubtful if the co-operation of the municipalities could be maintained if such were done. So long as the function of the board as outlined is observed, this very useful body should continue to perform an increasingly valuable service to the province.

A. E. HANNA, 410 Montreal Trust Building, Winnipeg, Man., has been appointed by F. H. Hopkins & Co., Ltd., of Montreal and Toronto, as their representative for the Prairie Provinces.

PERSONALS

N. H. POWELL has been re-appointed road superintendent of Peel County with office at Brampton, Ont.

GORDON KIRKS, of the engineering staff of the Ontario Hydro-Electric Commission, has been appointed chief electrical engineer for the New Brunswick Electrical Power Commission.

DR. FRANK D. ADAMS, vice-principal of McGill University, dean of the Faculty of Applied Science, has been appointed chairman of the Dominion Advisory Council for Scientific and Industrial Research, by the Governor General-in-Council.

J. R. MONTAGUE, Who resigned from the hydraulic engineering department of the Ontario Hydro-Electric Power Commission in 1920 in order to become chief engineer for D. G. Loomis & Sons, contractors, Montreal, has returned to the Hydro staff and is now engaged on construction work in connection with the Queenston development.

H. P. FIERHELLER, who has been a member of the purchasing staff of the Ontario Hydro-Electric Power Commission for several years, has been appointed as publicity manager for the Commission, succeeding W. M. BOSTWICK, who resigned in order to accept a position as publicity manager for the West Penn Power Co., Pittsburg, Pa.

J. B. NELSON, who has been in private practice as an inspecting engineer in Toronto for the past few months, has accepted a position on the engineering staff of the Dominion Bridge Co., Ltd., Lachine, Que. Mr. Nelson was formerly a structural engineer in the building department of the Ontario Hydro-Electric Power Commission.

HENRY PERCY BORDEN, who recently entered private practice in Ottawa, Ont., as a consulting civil engineer, was born on December 8, 1872, in Port la Tour, N.S. He was educated at Mount Allison University, Sackville, N.B., and at McGill University, Montreal, where he graduated in 1902 with the degree of Bachelor of Science. Mr. Borden began his technical career as an assistant engineer in the bridge department, Canadian Pacific Railway Co., Montreal, where he served from 1902 to 1904. In the latter year he was appointed as assistant chief engineer of the structural department, Montreal Locomotive Works, but two years later he returned to the C.P.R. as an architectural engineer. In 1908 he received an appointment to the staff of the Quebec Bridge Commission as an assistant engineer and secretary, and in 1915 he was promoted to be assistant to the chief engineer of the Commission.

In 1916, upon the death of C. C. Schnelder, the Dominion Government appointed Mr. Borden as a member of the Board of Engineers, Quebec Bridge, which position he held until the completion of that work in 1918. From 1919 to 1921 he was engaged by the Dominion Government in a consulting capacity, and a few years ago Mr. Borden opened his office in Ottawa, with the intention of specializing in bridges and structures in steel and reinforced concrete. Mr. Borden is a member of the Engineering Institute of Canada and of the American Society of Civil Engineers.

L. S. TRAINOR has been appointed district engineer in charge of the Illinois district of the Portland Cement As-

sociation, to succeed C. M. POWELL, resigned. This office, located in the Conway Building, Chicago, has charge of association work in Illinois. Mr. Trainor has been connected with the Portland Cement Association for the past three years, and has been engaged principally in Southern Illinois. Prior to joining the Association staff, he was county superintendent of highways, Marion County, and city engineer of Centralia, Illinois.

OBITUARIES

WILLIAM G. CHARLESON, a leading contractor of Ottawa, died at the Wellesley Hospital, Toronto, recently. The deceased was born in Quebec in 1867 and moved to Ottawa 35 years ago.

WILLIAM FRASER, well-known architect of Toronto, died at his home in that city on June 14. The late Mr. Fraser was born in Lochgilhead, Scotland, in 1868 and came to Canada in 1907. He was associated with the firm of G. M. Miller.

JOSEPH H. GREER, contractor, died at his home in Ottawa on June 11, aged 69. The deceased was born in Ireland and came to Canada 50 years ago, settling at Morewood, Ont. Later he moved to Winchester, Ont., residing there until about four years ago, when he went to live in Ottawa.

FEDERAL ROAD GRANT TO ONTARIO

UP to date the Ontario Department of Highways has received slightly over one and a half million dollars of Federal road subsidy, on account of expenditures already made on Ontario road construction. A cheque for \$47,000 received yesterday is the latest payment out of the allotted Federal funds.

Most of the amount received up to date covers work performed back in 1919 and 1920, although there is a small amount on hand on account of 1921 expenditures. There is understood to be almost two and a half million dollars coming to the Province on account of work done last year.

The Province is undertaking much more than sufficient work to earn its portion of the Federal appropriation, approximately \$5,000,000, and already more than two-thirds of the amount has been earned.

HALIFAX NOW HAS HYDRO POWER

HYDRO-ELECTRIC power from the St. Margarets Bay development is being used in Halifax, the transfer of the load from the steam plant having been made recently. The St. Margaret's Bay plant was constructed by the Nova Scotia Power Commission, a creation of the Provincial Government, which financed the undertaking. This commission has made a contract with the Nova Scotia Tramway and Power Co. to distribute electric current in the city at rates to consumers subject to the Board of Public Utilities. The St. Margaret's Bay plant has a capacity of 6,000 h.p., and the transmission line to Halifax is 18 miles long.

LONDON GEODETIC SURVEY

WORK has commenced on the 1922 section of the London geodetic survey. Considerable progress was made last year in the accurate mapping of the city and it is believed that by the close of the present season, the first geodetic map of the city will be very close to completion. This map will be the key to future town planning work in London and vicinity. Any plan of future city beautification adopted now would be liable to change, in view of the fact that present city maps are more or less incorrect.

The convention of the Association of Municipal Electrical Utilities will be held at Niagara Falls, Ont., on June 22, 23 and 24.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand or proposed, contracts awarded, changes in staffs, etc.

TENDERS PENDING

The following tabulation is presented as a reminder to contractors in regard to tenders that are still pending, other than those reported in this issue. The word "Issue" refers to the issue of "Canadian Engineer" in which there appeared a notice giving details regarding the call for tenders.

Place of Work	Tenders Close	Issue
Nassau, New Providence, Bahamas, dredging	July 15	May 9
Quebec, Province of, construction of road from Quebec to Ste. Anne de Beaupre	Jun. 23	Jun. 6
Quebec, Province of, construction of oiled waterbound macadam on a num- ber of roads	Jun. 27	Jun. 6
Saskatchewan, Province of, construction of earth road from Canora west six miles	Jun. 21	Jun. 6
Oakville, Ont., laying of cast iron suction pipe, constructing extension to pump house and furnishing and erecting gasoline or oil engines, turbine pumps and electric generator	Jun. 22	Jun. 6
East Nissouri Tp., Ont., construction of bridge	Jun. 29	Jun. 13
Montreal Division, C.N.R., construction of six structures	Jun. 24	Jun. 13
Nipissing and Nipigon Divisions, C.N.R., construction of nine structures	Jun. 24	Jun. 13
Ottawa Division, C.N.R., construction of two structures	Jun. 24	Jun. 13
Quebec, Province of, construction of oiled waterbound macadam on several roads in town of Ste. Therese	Jun. 27	Jun. 13
Calgary, Alta., supply of one motor-driven combination pumping engine and hose car	Jun. 30	Jun. 13
Etobicoke Tp., Ont., waterworks equip- ment	Jun. 26	Jun. 13
Lakeside, Ont., completion of drain	Jun. 29	Jun. 13
Port Burwell, Ont., repairs to breakwater	Jun. 28	Jun. 13
Ontario, Province of, work on Provincial Highways	July 7	Jun. 13
Kincardine, Ont., slow sand filters and equipment	Jun. 27	Jun. 13
Elmira, Ont., construction of sewers	Jun. 24	Jun. 13

BRIDGES, ROADS AND STREETS

Annan, Ont.—Council awarded contract to McKenzie & Symon, of Warton, for construction of an arch bridge for \$1,030, and culvert for \$240. Tenders were also received from Bryson & Irwin, Warton; Farrow & Corlett, Chatsworth; W. G. Moore, Allenford; and Wm. Clark & Son, Owen Sound.

Barton Tp., Ont.—Tenders will be received by Alfred G. E. Bryant, Clerk, Room 1, Court House, Hamilton, until noon, June 17, for construction of concrete sidewalks and macadamized stone roads. Specifications may be obtained from the Clerk or Engineer, J. J. McKay, Home Bank Bldg., Hamilton.

Birchcliff, Ont.—Tenders will be received by C. E. Fraser, Scarborough Township Engineer, Birchcliff, until 12 o'clock

noon, Wednesday, June 21, for the construction of three reinforced concrete bridges.

British Columbia, Province of,—Contract for construction of 2,074 miles of pavement on Yale Road in Chilliwack has been awarded by Highways Department to Columbia Bitulithic, Ltd., at \$55,000.

British Columbia, Province of,—Tenders will be received by the Hon. the Minister of Public Works until noon, Wednesday, June 21, for clearing and grading portions of the Cariboo Road. P. Philip, Public Works Engineer, Department of Public Works, Parliament Bldgs, Victoria.

British Columbia, Province of,—Hon. Dr. Sutherland, Minister of Public Works, announced that the hard surfacing of the Main Street in Salmon Arm will be undertaken and a lot of macadamizing will be done beyond the limits of the municipality. Other roads will be surfaced also, and at Merritt steps will be taken to repair the One-Mile road.

British Columbia, Province of,—Tenders will be received by the Hon. the Minister of Public Works, until noon, Tuesday, June 20, for the erection of two 60-ft. span King trusses over Cheam Slough on the Agassiz-Rosedale Ferry Road. Plans and specifications may be seen at the office of Government Agent, Vancouver; District Engineer, New Westminster; and the Department of Public Works, Victoria.

Cobourg, Ont.—Town Council awarded contract for King St. paving to the Warren Bituminous Paving Co. of Ontario, Ltd., Toronto. Tenders were also received from Curran & Briggs, Standard Paving Co. and Merlo, Merlo & Ray.

Cornwall, Ont.—Tenders were received until June 12 by J. G. Cameron, Engineer of United Countries of Stormont, Dundas and Glengarry for work on roads.

East Gwillimbury Tp., Ont.—Tenders will be received, addressed to A. R. McKenzie, Queensville, Ont., until June 22, for construction of concrete bridge. Plans and specifications may be seen at office of engineers, James, Proctor & Redfern, Ltd., 36 Toronto St., Toronto.

East Whitty Tp., Ont.—Township Council passed by-law authorizing construction of the following concrete sidewalks: On west side of Park Road, 1,090 ft.; on west side of Montrave Ave., 920 ft.; on south of Base Line, 2,124 ft. Clerk, P. G. Purves, Columbus.

Edenwold, R. M., Sask.—Contracts for 40 miles new turnpiling and regrading, 30 miles very light regrading, 11,000 cu. yds. filling and 500 lin. ft. culverts, were divided amongst the following: Ross Construction Co., Regina; Henry Zinkham, Balgonia, Sask.; H. C. Siebold, Pilot Butte, Sask.; E. H. Rawlins, Balgonia, Sask.; J. Schnell, Regina. Work will be supervised by the Parsons Engineering Co., Regina.

Edmonds, B. C.—Riverway and Hastings-Barnet highways are to be improved.

Eganville, Ont.—Tenders for approximately 17,000 sq. ft. of granolithic walks will be received until July 1 by J. S. McCann, Clerk.

Eramosa Tp., Ont.—Tenders will be received by J. J. Aldrous, Rockwood, until noon, Monday, June 26, for construction of six 6-ft. culverts, 18-ft. and 20-ft. concrete bridges. Engineer, A. W. Connor, 34 Victoria St., Toronto.

Etobicoke Tp., Ont.—Tenders will be received by Frank Barber, Toronto, until 12 o'clock noon, Monday, June 19, for construction of five concrete bridges. (See official adv.).

Fonthill, Ont.—Tenders will be received by A. M. Clark, Clerk, until June 1921 for construction of 493 lin.

ft. concrete walk on Chestnut St. and 545 lin. ft. on South Pelham St.

Fort Frances, Ont.—Tenders for the construction of approximately 10,700 sq. yds. of one-course concrete pavement and for the installation of sewer and water connections as required before the construction of the said pavement, will be received by J. W. Walker, Town Clerk, until 12 o'clock noon, Monday, June 26.

Fredericton, N. B.—Roads and Streets Committee of City Council will consider extension of pavement from Smythe St. along the Woodstock Road to O'dell Ave.

Guelph Tp., Ont.—Tenders close June 20 for construction of 25-ft. concrete bridge known as Jackson Bridge, for Counties of Waterloo and Wellington. Engineer, A. W. Connor, 34 Victoria St., Toronto.

Hensall, Ont.—Tenders will be received until Wednesday, June 28, for the construction of 9,920 square yards of reinforced concrete pavement on King St. Plans and specifications may be seen at the office of T. R. Patterson, Engineer, Goderich, or A. Murdock, village clerk, Hensall, Ont. (See official advertisement).

Hamilton, Ont.—Tenders will be received by S. H. Kent, City Clerk, until 5 o'clock p.m., on Monday, June 19, for one concrete mixer. Specifications may be obtained at the office of E. R. Gray, City Engineer.

Kitchener, Ont.—City Planning Commission propose the extension of Union St., Waterloo, to Lancaster St. adjoining Bridgeport in Waterloo Township, and the extension of St. Leger St. to the Waterloo-Bridgeport Road.

Lindsay, Ont.—Granolithic walks will be constructed on Albert St. and St. Lawrence St. Clerk, W. R. Alley.

Meaford, Ont.—Town Council plans to construct Trowbridge St., from Sykes St. to the bridge, this year. Clerk, Geo. G. Albery.

Newmarket, Ont.—Town Council decided to construct pavements on Millard and Cedar Sts. Clerk, P. J. Anderson.

Newmarket, Ont.—Town Council intends to construct Warrenite bitulithic pavements on Prospect St., Park Ave., Timothy St., Church St., Millard Ave. and Lorne St., at cost of \$73,200. Town Clerk, P. J. Anderson.

New Brunswick, Province of.—Provincial Government awarded following contracts for construction of bridges: Four Mile Brook Bridge, Madawaska County, Dexter & Richards, Fredericton, \$15,000; Bass River bridge, Gloucester County, Connolly Bros., Bathurst, \$9,000; Monks (Trappist) bridge, concrete arch., Rogerville, Northumberland County, Hanson & Gammon, Fredericton, \$16,000.

Niagara Falls, Ont.—Work on the concrete abutments for the bridge over the Hydro canal on Lundy's Lane has been started by Campbell Construction Co.

Niagara Falls, Ont.—Suburban Roads Commission awarded to McRea, Campaigne & Cooke, of this city, contract for over 3½ miles of suburban road, at \$60,645.

Niagara Falls, Ont.—Chamber of Commerce awarded contract to McRea, Campaigne & Cooke for asphalt penetration at \$60,645. Other tenders received: Asphalt-Law Construction Co., Ridgeway, \$63,125; Archibald Construction Co., Toronto, \$69,000. Tar—McRea, Campaigne & Cooke, Niagara Falls, \$58,945; Law Construction Co., \$62,950; Canadian Engineering & Contracting Co. of Hamilton \$70,000.

Oliver Tp., Ont.—Township Council passed by-law authorizing expenditure of \$4,800 on roads. Clerk, Chas. R. B. Hill, Murlile.

Ontario, Province of.—Frid Construction Co., of Hamilton, secured contract to construct section of Provincial Highway on Queenston Road, east of St. Catharines city limit.

Ontario, Province of.—The highway known as St. George road, leading north out of Brantford from the end of St. Paul's road and running in a practically straight line to Gault, has been declared a county-provincial road.

Ontario, Province of.—Tenders will be received by W. McLean, Deputy Minister of Highways, until 12 o'clock p.m., Friday, July 7, for work on Provincial Highways. (See official adv.).

Orangeville, Ont.—Tenders will be received by Wheelock & Christie, Engineers, Orangeville, until 2 o'clock p.m., Monday, June 26, for construction of following bridges and culverts in County of Dufferin: (1) A 100-ft. span bridge, alternate designs of steel and concrete; (2) a bridge with 2 spans of 85 ft. each, alternative designs of steel and concrete; (3) five, 6-ft. span concrete culverts; (4) an 8-ft. span concrete culvert.

Oshawa, Ont.—Town Council plans to extend Mechanic St. Engineer, W. C. Smith.

Oshawa, Ont.—Town Council authorized Railway Committee to open preliminary negotiations in connection with the construction of a subway under G.T.R. tracks, Simcoe St. S.

Ottawa, Ont.—Tenders closed June 15 for asphalt pavements on Lyon St., Renfrew Ave., Sberbrooke St. and Breezehill. A. F. Macallum, Commissioner of Works.

Ottawa, Ont.—Tenders will be received by H. R. Washington, Clerk, Carleton County, until 12 o'clock noon, Thursday, June 15, for the substructure for Porteous and North Gower Bridges. Plans and specifications at office of Patterson & Byrne, 71½ Sparks St., Ottawa.

Owen Sound, Ont.—City Council decided to construct sidewalks at an estimated cost of \$11,500. Council also awarded contract for concrete pavement on 2nd Ave. E. to McKenzie & Symon, at \$1.83 per sq. yd. Clerk, Chas. Gordon.

Pembroke, Ont.—Tenders addressed to S. L. Biggs, Clerk-Treasurer, will be received until 12 o'clock noon, June 22, for construction of approximately 26,600 sq. yds. asphaltic concrete pavement or Warrenite-bitulithic pavement with curb and gutter. Also approximately 3,000 sq. yds. of bituminous penetration roadway with curb and gutter. Plans and specifications may be obtained at office of J. P. Howe, Town Engineer.

Quebec, Province of.—The Coaticook-Norton highway is to be built at once. Minister of Highways, Hon. J. L. Perron.

Quebec, Province of.—Following contracts have been awarded by Highways Department for the resurfacing of macadam on the Montreal-Ottawa Highway: L'Abord-a-Plouffe, Co. Laval; Kennedy Construction Co., Montreal; Ste Dorothee, D. Lagace, L'Abord-a-Plouffe; Parish of Ste. Rose, West part, D. Lagace.

Rosslyn, Ont.—Council passed by-law providing \$9,000 for road work this year.

St. Jerusalem, Que.—It is understood that two sections of road, known as the St. Jerusalem road and the Bethany road, which will form part of the Montreal-Hull highway, will be completed and fully maintained by the Provincial Government, and it was decided by the municipal council to expend \$2,000 on the gravelling of a section of the Vide Sac road, under an arrangement whereby the Provincial Government will bear one-half of the cost. A considerable amount of road repair work is being undertaken.

St. Thomas, Ont.—Reopening of Hughes St. is projected. City Engineer, W. C. Miller.

Sandwich, Ont.—Tenders addressed to W. P. Coyle, Clerk, Essex County, Sandwich, will be received until 3 p.m., Wednesday, June 21, for the construction of 2½ miles of concrete pavement on Tecumseh Road, 1¼ miles of pavement on Front Road, alternate tenders for 2 miles of concrete or tar-bound-macadam road. Plans and specifications may be seen at office of J. J. Newman C.E., Davis Block, Windsor, or at office of County Clerk. Alternate tenders for about 1½ miles of concrete, or concrete base with asphalt top, plans, etc., for which may be seen at office of Code & Code, C.E., McGregor Bldg., Windsor, or at office of County Clerk. About 1 mile of concrete pavement in Town of Essex, plans, etc., for which may be seen at office of Laird & Laird, Essex, or at office of County Engineer.

Saskatchewan, Province of.—Highways Department awarded following contracts for construction of concrete bridges: 60-ft. reinforced concrete truss, south of Drinkwater, to John Kenward Co., Regina, at \$7,778.60; 40-ft.

reinforced concrete beam bridge, east of Maple Creek, to the John Kenward Co., at \$3,901; 20-ft. reinforced concrete beam bridge, west of Yorkton, to Levi Angst, of Cypress River, Man., at \$2,072.

Simcoe, Ont.—Paving & Mastic Co., of Simcoe and Toronto, has been awarded contract for construction of town-line bridge over Patterson creek.

Sombra Tp., Ont.—Tenders addressed to John McCallum, Road Superintendent, Lambton County, Alvinston; or to John A. Huey, County Clerk, Sarnia; or to George A. McCubbin, County Engineer, Chatham; will be received until noon, Wednesday, June 28, for the completion of pavement.

Stamford Tp., Ont.—Tenders are being received at Clerk's office for construction of concrete sidewalks for 1922. Plans and specifications at Engineer's Office, Township Hall, Ferry St., Niagara Falls, Ont.

Stratford, Ont.—Tender of Curran & Briggs, Toronto, for asphalt surface paving at \$1.45 per sq. yd. was accepted by Board of Works Department.

Stratford, Ont.—Perth County Council decided to raise \$40,000 for good roads. Road Supt., John Roger, Mitchell, Ont.

Sudbury, Ont.—Town Council decided to build a 29-ft. roadway, 8-in. rock base, $2\frac{1}{2}$ tar and macadam surface, from end of the bitulithic pavement, Cedar St. bridge., to Carleton St., and along Carleton to Elm St. Clerk, W. J. Ross.

Tara, Ont.—Tenders addressed to the Township Clerk, Tara, will be received until 6 p.m., Saturday, June 17, for the construction of an arch bridge 20 ft. span on the 9th Con. of Annan between Elora Road and "B" Line. Plans and specifications may be seen at offices of Township Clerk, C. A. Speer, Tara, and of R. McDowall, C.E., Owen Sound.

Teck Tp., Ont.—Tenders will be received by C. R. Fullerton, Director, Northern Development Branch, Parliament Bldgs., Toronto, until Wednesday, June 14, for ditching the Latchford-Cochrane Trunk Road. Approximately 1,200 cu. yds. to be excavated.

Toronto, Ont.—City Council referred back the proposal to widen Jane St. to 36 ft. at cost of \$80,000.

Trafalgar Tp., Ont.—Tenders will be received by Roy F. Smith, Resident Engineer, Oakville, Ont., until 12 o'clock noon, Monday, June 26, for the construction of approximately 10,250 sq. yds. of concrete pavement. Plans and specifications may be seen on application to the Engineer, Dundas St., Oakville.

Walkerton, Ont.—Town Council awarded contract for paving road from G.T.R., station to C.P.R. station to the Warren Bituminous Paving Co. of Ontario, Ltd., Toronto, at approximately \$65,000.

Walkerville, Ont.—Following contracts were received for paving Mommouth Road, sidewalks in Willistead, alley pavement east of Lincoln and repairs corner Devonshire and Sandwich Sts.: Merlo, Merlo & Ray, \$14,270.85; Premier Construction Co., \$13,436.26; Cadwell Sand & Gravel Co., \$12,605.17. For paving Mommouth Road, sidewalks in Willistead and alley pavement east of Lincoln: Chick Contracting Co., \$13,099.32. For sidewalks in Willistead, Coloulti Bros., \$2,299.20. Contract for whole work was awarded to the Cadwell Sand & Gravel Co.

Welland, Ont.—Report will be made at next meeting of City Council on resurfacing of Bugar St. at estimated cost of \$13,000. City Engineer, Chas. L. Coulson.

Welland, Ont.—Welland County Council awarded contract for surface treatment of the road from Port Colborne to Marshville to the Bituminous Spraying & Contracting Co., Ltd., of Toronto, at \$1,115.25 per mile. There was one other tender, from the Law Construction Co. Canadian Engineering & Contracting Co., of Hamilton, was awarded contract for construction of a 9-ft. water-found macadam road in the Township of Pelham, $2\frac{1}{4}$ miles, at \$9,400 per mile. Other tenders received: John Pirson, Stevensville, \$9,979.20; McIntosh & McDougall, Cornwall, \$9,900; Roy Honsgerger Vineland, \$10,200. Law Construction Co., of Ridgeway, was awarded contract for construction of 16-ft. water-bound macadam road in the Township of Wainfleet, 5

miles, at \$15,500 per mile. Other tenders received: John Pirson, Stevensville, \$15,945.60; Geo. B. Begy, Belleville, \$19,500; and the Canadian Engineering & Contracting Co., Hamilton, \$18,500. Council adopted recommendation of Welland Suburban Roads Commission for rebuilding of 16-ft. asphalt penetration roads in this area $4\frac{1}{2}$ miles, at \$15,880 per mile, or a total of \$71,460.

Wellington Co., Ont.—Tenders will be received by James Beattie, County Clerk, Fergus, Ont., until 2 p.m., Wednesday, June 21, for the construction of bridges in the townships of Nichol, Erin, W. Garafraxa, etc.; also retaining wall. Engineer, A. W. Connor, 34 Victoria St. Toronto.

Whitby, Ont.—Ontario County Council decided to add eight miles to the county road system.

Whitby, Ont.—Ontario County Council decided to re-by-law providing for raising of \$20,000 for county roads and bridges this year.

Whitby, Ont.—Ontario County Council decided to repair several culverts, construct two new culverts and paint the county bridges. D. J. Kean, Whitby.

Whitby, Ont.—Town Council authorized issuing of debentures amounting to \$99,404 to cover expenditures connected with paving of Dundas and Brock Sts. Clerk, Albert W. Jackson.

Whitby, Ont.—By-laws will be passed by Ontario County Council on July 28 authorizing the issue of \$75,000 debentures for road construction on Provincial and county highways. Road Supt., D. J. Kean, Whitby.

Winnipeg, Man.—City Council intends to construct granolithic sidewalks on a number of streets at a total cost of \$23,505. City Engineer, W. P. Brereton.

Winnipeg, Man.—Contract for construction of granolithic walks on Argyle, Henry, Winnipeg, Owens and Greenwood Streets, was awarded by City Council to W. P. Brereton, City Engineer.

Woodstock, N. B.—Town Council plans expenditure of \$10,000 on concrete sidewalks this summer.

Woodstock, Ont.—Board of Works decided to construct curb and gutter on Oxford St. Clerk, John Morrison.

Woodstock, Ont.—Estimates of Oxford County Council for this year include the following items: County road repairs, \$30,000; county bridges, \$5,000; and Provincial Highways, \$34,805.29.

Woodstock, Ont.—Town Council intends to pave Allan St., between King and Willow; Willow, between Allan and Erb; and Erb St., from Willow to the bridge. Estimated cost, \$33,942. Town Engineer, Chas. Moogk.

Woodstock, Ont.—Town Engineer Chas. Moogk is preparing estimates on paving of John, Union and Mary Sts. Council awarded contract to Paul Bergman for curb and gutter along above-named streets at 75c per ft.

Woodstock, Ont.—Town Council instructed the chairman of Board of Works to repair King St., between William and the Kitchener boundary, and to obtain estimate on improvements to the road running north westerly from Erb St. to the Amos Weber property.

WATERWORKS AND SEWAGE

Guelph, Ont.—City Council passed by-law providing for construction of intercepting sewer from corner of Yorkshire St. and Waterloo Ave. to the city disposal plant. City Engineer, F. McArthur.

Guelph, Ont.—City Council passed by-law providing for borrowing of \$36,475 for construction of storm sewers in connection with pavements on certain streets, and another one for the borrowing of \$17,920 for same purpose.

Halifax, N. S.—Contract for 90-ton of 6-in. water pipe for city was awarded to T. McAvity & Sons, of St. John, N.B.

Hespeler, Ont.—Town Council decided to construct water mains on Victoria St. Clerk, M. E. Jardine.

Montreal, Que.—Work will be started shortly by the Public Works Department on sewers on Tallion, Paul, Desmarteau and Bernard Sts., Mercier Ward. Approximate cost, \$125,000.

New Westminster, B. C.—Plans are being made by City Engineer Stewardson for the construction of a 25-in. main to the high level reservoir.

St. John, N. B.—Provincial Hospital Commissioners decided to construct water main to Annex, Sand Cove.

Toronto, Ont.—Contracts for construction of sewers awarded as follows: To W. E. Taylor, Victoria, \$34,927; Walpole Ave., \$845. To Ruscica Bros., Small St., \$891.92.

Toronto, Ont.—Contracts for laying and jointing of 6-in. water pipes were awarded as follows: To W. E. Taylor, Alberta Ave., Brunswick Ave., Evans Ave., Fairland Ave., Forman Ave., Glenmount Park Road and Runnymede Road, \$3,272.91; Rose Park Crescent, Ruscica Bros., \$425.30.

Welland, Ont.—City Council will extend the sewer on Wilton Ave. City Engineer, Chas. L. Coulson.

Welland, Ont.—City Council let contract for construction of sewers on Queen and Margaret Streets to C. J. White, for \$1,990.80. Tender was also received from Somerville & Dilworth at \$2,088.32.

LIGHT, HEAT AND POWER

Edmonton, Alta.—Contract for supply of two induction feeder voltage regulators and two 2,000 k.v.a. transformers to city has been awarded to the Canadian General Electric Co., Ltd.

Ottawa, Ont.—Lowest tender received for lighting posts for Cummings Bridge was submitted by the Campbell Steel & Iron Works, Ltd., Carling Ave., Ottawa, and it is probable that the City Council will accept this tender.

Toronto, Ont.—Tenders addressed to Chairman, Toronto Electric Commissioners, will be received until 5 o'clock p.m., Monday, June 19, for erection of a sub-station building on Eglinton Ave., including excavation, masonry, structural steel, etc., roofing, plumbing, painting, and such other work required for a completed building. Plans and specifications may be obtained at the Engineering Department at Station "P," corner Duncan and Nelson Streets.

Winnipeg, Man.—Contract for supply and delivery of three 1,000 k.v.a. transformers complete at the city's Terminal Station Rover Ave., awarded by City Council to the Canadian Westinghouse Co., Winnipeg, at \$10,370 f.o.b. Winnipeg.

RAILWAYS

Aroostook Falls, N. B.—Contract awarded to D. C. Burpee & Son for construction of four miles of railroad for the Aroostook Valley Railway Co.

FACTORIES AND LARGE BUILDINGS

Brantford, Ont.—The erection of new \$20,000 churches for the Shenstone Memorial Baptist, Terrace Hill, and Riverdale Baptist, Holmesdale.

Cassidy, B.C.—Tenders will be received by the Hon. the Minister of Public Works until 12 o'clock noon, Tuesday, June 27, for the erection of a two-room school house. Plans and specifications may be seen at the offices of the Government Agents at Nanaimo and Vancouver; on application to the Secretary of the School Board, Wm. Eastgate, Cassidy and the Department of Public Works, Victoria.

Downtown, N. B.—Woodworking factory, warehouse, dry-sheds and other buildings owned by Henry Swim, of this place, were destroyed by fire. Loss, \$20,000.

Edmonton, Alta.—Federal Government will construct \$100,000 wing at Strathcona Hospital.

Galt, Ont.—Public School Board will likely build another ward school this summer, and will proceed immediately with the remodelling of Victoria School at a cost of \$10,000.

Galt, Ont.—Contract for carpenter work in connection with erection of factory for Newlands & Co., Ltd., has been awarded to P. G. Hamill, and the masonry work to Jas. S. Webster.

Guelph, Ont.—Tenders for erection of Brooklyn Sunday School building were received by Prof. R. Harcourt until June 19.

Guelph, Ont.—Mahoney & Austin have been appointed architects in connection with construction of new Roman Catholic chapel at the corner of Metcalfe and Alice Sts. and also for two-room addition to St. Patrick's school.

Guelph, Ont.—Tenders addressed to H. F. McNaughton, Secretary, Public Works Dept. of Ontario, Toronto, will be received until June 20 for erection of stable, barn and two cottages in connection with the Veterinary College, Ontario Agricultural College. Plans and specifications may be seen in Bursar's office at the college and at Department of Public Works, Toronto.

Haileybury, Ont.—Tenders addressed to R. A. Spencer, Secretary, Public School Board, will be received until June 22 for installation of heating system in Public School building. Plans and specifications may be obtained at the office of H. L. Slaght, chairman of Board.

Hespeler, Ont.—Town Council passed bylaw for erection of public library building. Clerk, M. E. Jardine.

Hornepayne, Ont.—Tenders will be received by M. W. Tompkins, Secretary, School Board, until June 20 for various trades in erection of a four-roomed public school. Architect, R. E. Mason, Fort William.

Kenora, Ont.—Actual work of construction of first unit of large pulp and paper mills of the Backus-Brooks Co. has started. Mr. McLellan is in charge of construction.

Kingsville, Ont.—Tenders will be received until 12 o'clock noon, June 19, by the Building Committee of Epworth Methodist Church, for supplying all materials and labor for building a Memorial Hall. Plans and specifications may be seen at office of R. Healy, Main St., Kingsville.

Lillyfield, Man.—Contract for school awarded to Johnes & Mason, Winnipeg.

Lloydminster, Sask.—Plans for 8-roomed school have been prepared by A. M. Jeffers, Architect, Edmonton, and tenders will soon be called. Estimated cost, \$50,000.

Montreal, Que.—Stockyards were damaged by fire to the extent of \$50,000.

Montreal, Que.—Permit issued to Salvation Army to construct hall on Bickerdike St., Ahuntsic Ward, at cost of \$12,000.

Montreal, Que.—Catholic School Commission awarded contract for erection of Stadacona School to Girard & Gratton, for \$126,000.

Montreal, Que.—Tenders close June 20 for excavation of basement and caissons and concrete work in foundation walls and caissons for an extension to the Head Office Building of the Sun Life Assurance Co. of Canada, at the corner of Dorchester and Mansfield Sts. Architects, Darling & Pearson, 2 Leader Lane, Toronto.

Nanaimo Bay, B.C.—Tenders will be received by the Hon. the Minister of Public Works, Victoria, until 12 o'clock noon, Tuesday, June 27, for erection of a two-room addition to the existing school house. Plans and specifications may be seen at the office of the Government Agents at Nanaimo and Vancouver on application to George Moore, Secretary to School Board, 124 Strickland St., Nanaimo or the Department of Public Works, Victoria.

Niagara Falls, Ont.—Tenders for the erection of a four-roomed addition to Falls View Public School, from all trades, will be received until 4 p.m., June 18. Plans and specifications at office of C. M. Borter, Architect, 102 Main Street.

North Bay, Ont.—Contract for erection of High School awarded to Mill-Cherk-Francis, of North Bay.

North Qu'Appelle, Sask.—Debentures amounting to \$1,000 are being issued by G. M. Bushell, Secretary-Treasurer of Devon S. D. 4468, Rural Municipality of North Qu'Appelle, No. 187, for erection of school building, etc. Further particulars from the Secretary-Treasurer, Fort Qu'Appelle, Sask.

North Toronto, Ont.—New church building is to be erected at once for Davisville Baptist congregation at the south-east corner of Belsize Drive and Mount Pleasant Road, at a cost of \$20,000.

LONDON HOISTS

The life of a Hoist depends upon its ability to withstand the constant grind under conditions prevailing on construction work.

London Reversible Hoist Type B.
Fully described in Bulletin 27 B

LONDON HOISTS are designed and built with special attention paid to the parts that undergo the severest strain.

THEY ARE BUILT STRONGER TO LAST LONGER

London Double Drum General Purpose Hoist Type C. Fully described in Bulletin 27 C

Double Drum Heavy Duty Hoist Type E. Fully described in Bulletin 27 E

We manufacture a full line of Hoists of all types for either Gasoline or Electric Drive. Write our Engineering Dept. — It is at your service—Use it and send for catalogue No. 27.

SPIRAL RIVETED PIPE, LAP WELDED STEEL PIPE, FORGED STEEL PIPE FLANGES, EXHAUST STEAM and HYDRAULIC SUPPLIES

Use ~~the~~ Portable Compressors

"If We Only Had the Air"

You have probably said this many times when you were using hand methods on work which could have been done in a fraction of the time with air tools.

Erecting a stationary air compressor plant and piping up would have cost more than the air tools could have possibly saved—and the job was too short to take this trouble and spend the money.

An Ingersoll-Rand Portable Compressor Plant would have solved the problem. You could have rolled it up to the job, connected up the air tools, and have been finished in a fraction of the time—and with about one-half the number of men.

These Portable Compressor Plants are complete with compressor, gasoline engine (or electric motor) air receiver, cooling system and accessories. Gasoline engine driven types are built in three sizes—45, 118 and 210 cubic feet per minute. Electric motor driven types are in two sizes—45 and 118 cubic feet per minute.

When air power is as portable as a gang's tool box can you afford to work without it?

Let us send you copies of Bulletin 3315 and Forms 1062 and 1107 which tell the story in detail.

-ALL within the empire

—yet it is within the price range for light mixers

THE Dandie is a light, easily portable mixer for concrete footings, culverts, floors, and has also proved suitable for mortar mixing.

It is a Koehring mixer—Koehring designed and constructed—and this means that dependability and long service life are the first considerations, not lowest price. No it is not the lowest priced mixer, but is well within the price range for light mixers, making it the greatest *value* in light mixer field. It sets a new standard of efficiency and value for light mixers. Big production, standardization in every part, and automatic shop equipment keeps the price down!

Send Today for Catalog D 27.

Get the details of construction—the liberal drum dimensions—double gear drum drive—the drum roller construction—universal bearings, mixing action—the two side discharge control—trouble-proof power—dust-proof housing. Get these details and you will see why the Dandie offers a remarkable value. Write for catalog D 27 today.

If Municipalities Would Only Investigate

THEY would discover that thousands of dollars required for costly new dams or reservoirs and additional pumping equipment could be saved by comparatively small expenditure for good Water Meters. Savings in water consumption from 20% to 50% can be made by installing a reliable and accurate make of water meter—and you set the "rate per thousand gallons" to meet your financial requirements.

Write us your problems—for facts and figures. No obligation of course.

ROBERTS FILTERS

"Pure Water Guaranteed"

In Montreal

the citizens who are supplied with water from the municipal system are protected against water-borne diseases by ROBERTS equipment, which means

"Pure Water Guaranteed"

Absolute guarantees accompany every installation of Roberts Filters, so the purchasers run no risk.

We build gravity and pressure type filters for town and city supplies, also sand and charcoal filters,—in fact filters for

every requirement — municipal and industrial.

Hundreds of "Roberts" plants have been installed throughout Canada and the United States, all of which have given complete satisfaction.

Most of the earlier filter plants in Canada were "ROBERTS-

equipped", and special attention has been given for the past twenty years to the special requirements of the Canadian field, with the result that ROBERTS filter equipment for Canadian work has been tried, tested and improved to a point where success is certain and no experimenting is needed.

Are You Doing Your Share Toward Conservation?

The problems of fuel, labor and maintenance costs in waterworks seem unsolvable—and in many cases will remain unsolvable—until you take the necessary steps to eliminate waste.

It takes coal or electrical power to pump water through your mains, and coal and electricity cost money.

When all the leaks in your system are located, and the consumption reduced to a normal condition, there will be a tremendous saving, with consequent reduction in the cost of operating the pumping station.

If you are operating a gravity system, you save the cost of building new supply lines, reservoirs, etc., by stopping unnecessary waste of water.

A Pitometer Survey

in one instance showed an escape of 788,000 gallons daily. The stoppage saved an annual expense to the city of \$17,000.

We Have the Proof to Show You

Our engineers will gladly take up this matter with you and advise according to your local conditions. Let's talk it over! No charge to you for doing so and you will be under no obligation to us.

Our Bulletin on GUNITE SLABS (issued in 1920) contained copies of official reports made by Prof. M. O. Fuller, Lehigh University, and Mr. George E. Strehan, Con. Eng., New York City, describing breaking tests made on slabs. On page 20 of this bulletin reference is made to a slab left for future examination. This slab, which was loaded May 7th, 1920, is 8 ft. span, 3¼ in. thick and carries a load of 440 lbs. per sq. ft.

The above photograph shows this slab as it appears today, after having been constantly subjected to this overload for two years. Note that the deflection is now 2 in. and that there is no increase in the number or size of cracks at this time.

JOHNSON HYDRAULIC VALVES

WE HAVE BUILT a number of these valves for controlling the flow of water in penstocks at various Canadian plants and at present have under way in our shops the largest penstock valve of this type yet attempted. It is 20 feet in diameter, and for service under 140 ft. head at the plant of the Shawinigan Water and Power Co. We are also building several 36 inch Johnson combined stop and check valves for use in water mains of the Montreal Water Works Department.

*We also build
Paper Mill Machinery,
I. P. Morris Hydraulic
Turbines and Pumps,
Electric Steam Generators,
Large Gate Valves, etc.*

THE JOHNSON VALVE is built in several types to suit various conditions, and when arranged for automatic closing is a most effective protection against damage by flooding from broken pipe lines.

*Send for 1921 Bulletin containing interesting
descriptions of the various types and
their applications.*

JENKINS DISCS

assure trouble-free valve service.

In every type of valve the disc is the part that gets the wear — the part that must be good if the valve is to function satisfactorily.

Jenkins Discs, manufactured from high grade rubber and special ingredients, stand the wear and strain because their manufacture is governed by a knowledge of what they will be called upon to do.

There's a Jenkins Valve for every service and a Jenkins Disc for every valve. Know the genuine by the Diamond Mark.

Reliable Water Supply at Low Cost

For driving pumps of small and moderate sizes, particularly when placed in remote locations, electric power is often cheapest. Electric distribution systems, however, are subject to interruptions of service, as from storms, power house accidents, etc. A number of users of De Laval pumps, therefore, have insured continuity of service by installing gas or gasoline engines as "stand-bys."

The photograph shows a De Laval two-stage centrifugal pump driven by a Sterling gas engine, as installed at Lindsay, Ont. The pump is designed to deliver 1325 gal. per min. against 290 ft. head, when running at 1450 r.p.m.

De Laval centrifugal pumps have been especially designed to give regular, continuous service. All internal parts are accessible upon lifting the casing cover, and can then be lifted out after removing the bearing caps. Parts subject to wear, such as bearings, shaft sleeves, impellers, wearing rings, etc., are made to limit gages and are interchangeable. Repair parts can be obtained by giving the number which is stamped upon each part.

Their high efficiency and low starting torque are peculiarly valuable where electric power is used. All De Laval pumps are guaranteed as to efficiency, and the efficiency is demonstrated by test before the pump leaves the Works.

Describe your requirements and ask for our special Catalog B 62.

CONCRETE PRODUCTS

Wettlaufer Bros. Limited

178 Spadina Ave. Toronto, Ont.

Let's get down to brass tacks on this matter of price?

What real difference does it make to a municipality whether the engineer buys a cheap asphalt or whether he buys

MEXICAN EAGLE ASPHALT

for a few dollars a ton more?

You know that the average square yard of, say, two inch sheet asphalt pavement weighs 200 lbs. This ordinarily contains 80% sand, 10% dust and 10% asphalt cement. Therefore a square yard of pavement requires only about 20 lbs. of pure bitumen. As our asphalt is practically 100% pure bitumen, this means that one ton of 2,000 lbs. will lay approximately 100 yards of pavement. Therefore a difference of \$1.00 per ton in price means a difference of only 1 cent per square yard in the cost of the pavement!

Full information and samples upon request.

Canadian Good Roads Convention at Victoria

Most Successful Meeting — Delegates From All Parts of Canada Evince Great Interest in Good Roads Movement — Valuable Technical Papers Read Dealing With Road Construction Problems — Sessions Well Attended

(Staff Correspondence)

FROM the Atlantic to the Pacific, cabinet ministers, members of parliament, engineers, and prominent business men from every province of the Dominion, arrived at Victoria during the week-end to attend the Ninth Annual Convention of the Canadian Good Roads Association, which was held at the Empress Hotel, Monday, June 12 to Thursday, June 15. The large avenue of welcome banners with the light standards festooned with golden broom. The profusion of bloom in the gardens of the Parliament Buildings and of the Hotel presented a striking and charming appearance, and the delegates were conscious of an air of welcome on every hand.

Morning Session, Monday

The opening session was devoted chiefly to the registration of delegates. Addresses of welcome were given by Premier Oliver, Hon. E. D. Barrow, Hon. W. H. Suther-

land, Hon. A. M. Manson, Acting Mayor J. Harvey, J. L. Beckwith and by representatives of the local clubs and organizations. The addresses were suitably acknowledged on behalf of the association by S. L. Squire, a past president, and the present chairman of the executive committee, who referred to the bright prospects for a successful meeting, and the

future of the association evinced in the large number in attendance. Every province in the Dominion was well represented, as well as many states in the Union, all of whom had assembled for the exchange of views and the discussion of problems of vital interest to national development. Unusual interest attached to the very excellent programme arranged by the executive committee.

Afternoon Session, Monday

The opening address was given by the president of the association, Hon. S. J. Latta, Minister of Education for Saskatchewan, who dealt chiefly with the human element

HON. J. L. PERRON
President, Canadian Good Roads Association

HON. S. J. LATTA
President, Canadian Good Roads Association

RUSSELL T. KELLEY
First Vice-President, Canadian Good Roads Association

land, Hon. A. M. Manson, Acting Mayor J. Harvey, J. L. Beckwith and by representatives of the local clubs and organizations.

The addresses were suitably acknowledged on behalf of the association by S. L. Squire, a past president, and the present chairman of the executive committee, who referred to the bright prospects for a successful meeting, and the

as a factor in Canada's development. Mr. Latta's address in a concise manner covered a wide field, and touched on nearly all the legislative, engineering and economic problems of the road builder. Running through it all, however, was the argument that the possession of great wealth in natural resources such as Canada enjoyed, would not of itself, bring greatness to a nation. Those conditions must

also be secured which promote happiness and contentment. He pointed out that the best results would be accomplished by the association in proportion as its members promoted all the interests of all localities of this great land, and that the greatest good will come to each unit when the greatest good comes to all.

Mr. Latta suggested the following points as being worth consideration. The greatest good to the greatest number, most direct route possible for traffic, avoidance of sharp curves, advantage of easy grades, minimum construction cost, economy of maintenance, correlation of each road selected and located to all other portions of the whole system, relation of the road as a feeder to the railways, drainage facilities, proximity of road material, future requirements, necessity for bridges and culverts, money available for the project proposed.

The advantage of careful scientific planning could not be over-estimated. A well-planned road system would help build up manufacturing industries; reduce the cost of living by bringing rural residents within closer reach of the urban dwellers, help attract settlement and elevate social life of the community.

Road building is a great co-operative enterprise. Tax-payers of any given community should co-operate with each other in the interest of all. The distribution of funds depends on the ability to contribute and the benefit derived from the utility provided. Provincial aid to the communities ought to be given on the same basis. It is quite evident that a basis of population may not fulfill all requirements of the purpose of co-operation. In like manner it may easily be shown that distribution of federal aid among provinces on a population basis may be, in many respects, unjust and inequitable.

Emphasizing the magnitude of the road building problem, the president instanced the relatively small population spread over an immense area. Upon a family of four persons, less than the average, rests the enormous responsibility of building and maintaining one mile of roadway and upon five average families the construction and maintenance of a mile of main market highway.

Before more railways are built or extended, land areas must be examined and found fit to serve the human element. Scientifically planned road systems ought to be devised so that railways, roads and economical value of land may be made fit in with each other.

Prof. K. A. Clark, of the University of Alberta, presented an interesting paper, which appears in this issue, on "Experiments in Improving and Maintaining Prairie Roads." Prof. Clark has been conducting some research in the treatment of soils, the object being to discover a method by which natural ingredients of the prairies could be treated or combined to secure greater stability. While he stated that the idea was not entirely new, he had succeeded in getting encouraging results, and demonstrated that by recovering bituminous oil from the Alberta tar sands, he had combined this oil with the natural wet soils and obtained as a result, a hard non-absorbent substance capable of resisting relatively high pressure. Further results of Prof. Clark's experiments will be awaited with deep interest, especially by those in the prairie provinces.

H. R. MacKenzie, chief field engineer for Saskatchewan, read a paper on the "Drainage of Prairie Roads," and in a lucid manner set forth the problems met with and the methods adopted, to meet the conditions peculiar to the prairies. This paper appears in another part of this issue.

Germain P. Graham, of Albany, N.Y., district engineer of the Asphalt Association, gave an illustrated talk on the use of asphalt for road building. Mr. Graham showed 30 slides and 2 films of moving pictures, giving details of plant and methods for the construction of penetration and asphaltic concrete roads. Also for surface treatment and black base foundation. The films shown by Mr. Graham were the property of the Bureau of Public Roads, Washington, D.C., and were much appreciated. Mr. Graham explained each slide and the various steps in construction as shown in the films.

At the conclusion of the afternoon session the reception committee took the delegates by motor to the many interesting and scenic points of the city, and in the evening entertained them with a most unique and enjoyable theatre party.

Morning Session, Tuesday

The presiding officer for the morning session was J. A. Duchastel, chief engineer of Outremont, Que., and the first address was given by A. W. Campbell, Commissioner of Highways for the Dominion Government, who dealt with "Federal Aid, Its Implications and Results." This paper appears in another part of this issue. Much interest in the subject was taken, and in discussion, the British Columbia delegates made a strong plea for extra consideration in view of the greater natural obstacles which had to be overcome in that province. This view received some support from the delegates from eastern provinces.

A very interesting paper was read by J. D. Robertson, Deputy Minister of Public Works of Alberta, on "How to Improve Earth, Clay and Sand Roads. This paper appears on another page in this issue.

The difficulties confronting the road builders of the prairie provinces were clearly set forth. The enormous mileage cared for, and the scarcity of suitable materials, compels the engineer to adopt methods rather novel to those from the other provinces. Every effort is made to utilize the surface soil, including sods and turf, as these afford a sort of fabric giving greater stability to the surface. Much of the construction is done by the use of the grader, drawn by a heavy tractor.

A feature of the afternoon session was an eloquent plea for better roads as a nation-building force, by A. P. Sandles of Columbus, Ohio. He warned against the construction of costly highways and said that the patrol and maintenance were the secrets of good roads. The progressive way to regard the question was not from the point of taxation, but from the standpoint of benefits derived.

Hon. J. L. Perron, of Quebec, Minister of Highways for the province, in the afternoon outlined Quebec's road policy since 1912. He declared that the program inaugurated in 1912 was now practically completed and that by next August there would not be a mile of road in the province that was not in first class condition. He said about \$8,500,000 would probably be expended on roads for the present year. Quebec spent \$1,000,000 on roads in 1912.

James Allen, supervisor of State Highways of the State of Washington, presented an excellent paper, which appeared in June 20 issue of "The Canadian Engineer," on "Cement Concrete Roads," as adopted in that state. In Washington this type of construction is the only one used for rigid surfaces, and has given great satisfaction from the standpoint of construction, maintenance and durability. The paper was ably discussed by A. E. Foreman, Western representative of the Portland Cement Association.

A number of interesting points were brought out in a paper on "Road Machinery," by F. L. MacPherson of the Department of Public Works, Victoria, B.C. He pointed out the necessity of the road engineer being versed in matters relating to the mechanical engineer. The care, maintenance and repair of all mechanical equipment are essential to the efficient working of a road builders' outfit.

Election of Officers

The afternoon session was brought to a close by the election of officers for the ensuing year as follows:

Hon. president, Hon. S. J. Latta, Regina; president, Hon. J. L. Perron, K.C., Montreal; first vice-president, R. T. Kelley, Hamilton, Ont.; second vice-president, F. L. Fel-lows, Vancouver, B.C.; secretary-treasurer, G. A. McNamee, Montreal; directors, Jos. Beaubien, Outremont, Que.; H. S. Carpenter, Regina; Wm. Findlay, Toronto; Geo. Hogarth, Toronto; J. D. Robertson, Edmonton; P. Phillip, Victoria; S. R. Henderson, Winnipeg; G. F. Pearson, Halifax; R. D. Patterson, St. John; A. M. Rankin, M.P.P., Collins' Bay, Ont.; T. J. Mahoney, Hamilton; H. H. Shaw,

Charlottetown; P. J. A. Duchastel, Outremont, Que.; P. Gommery, Vancouver; R. H. Murray, Halifax.

During these sessions the ladies were very graciously entertained by the women's organizations and given opportunities of visiting all the points of interest, one of the chief functions being a reception and musicale in the hotel parlors, given by the Women's Canadian Club.

gainst motor and highway alike. He urged the adoption of regulations requiring each truck to be stamped in large letters with its capacity in tons, and the punishment by law of all who exceed the limits.

A limited number of the delegates were the guests of the Canadian Automobile Association at luncheon, at which Dr. Doolittle presided, the guest of honor being His Honor

GEO. A. McNAMEE
Secretary-Treasurer, Canadian Good Roads Association

G. FRED PEARSON
Director, Canadian Good Roads Association

WILLIAM FINDLAY
Director, Canadian Good Roads Association

An informal reception was given to the delegates by His Honor, the Lieutenant-Governor and Mrs. Nichol, and an enjoyable evening was spent.

Wednesday Morning Session

The morning session opened promptly with S. R. Henderson, president of the Manitoba Good Roads Association, in the chair.

P. Philip, engineer of the Department of Public Works for B.C., in a brief but comprehensive manner, outlined the system in vogue in British Columbia and stated that by a progressive system they were gradually linking up the various settled sections by a system of trunk roads which would ultimately form part of an all-Canada trans-continental highway. Governmental classification and systematic supervision by expert engineers, he stated, were securing higher efficiency, and that the only roads they were constructing were good roads.

Mrs. Mary Ellen Smith, M.P.P., took part in the proceedings, pointing out the great natural difficulties to be met with in British Columbia. She spoke of the value of the East meeting the West by means of a Canadian National Highway and propounded the slogan "See Canada by Motor Car."

The subject of colonization roads was dealt with by W. F. Fullerton, Superintendent of Colonization Roads for Ontario. He pointed out the necessity for taking the utmost care in the location of all colonization roads, and for generous treatment of such districts. Settlement in new areas, he stated, was irrevocably bound up with road construction.

"The Maximum Weights, Speed and Width of Tires, etc., of Motor Trucks," was the subject of a paper given by C. W. Cornell, manager of the White Co., Seattle, Washington. This paper will appear in an early issue of "The Canadian Engineer." The speaker laid stress on the value of pneumatic tires in prolonging the life of rigid surfaces, and condemned the practice of overloading, as a crime a-

gainst the Lieutenant-Governor. After toasts to the King, and the President of the United States, short addresses were given by His Honor Mr. Nichol, and by Mr. Sandles of Columbus, Ohio.

Wednesday Afternoon Session

T. J. Mahoney, past president of the Ontario Good Roads Association, occupied the chair and introduced as the first speaker, Hon. John P. Hartman, of Seattle, Washington, who's paper will shortly appear in "The Canadian Engineer." Mr. Hartman's subject was "Permanent Highways," and in his inspiring address he laid stress on the necessity of organizing the present economic position of the farmer, and incidentally affording adequate means to transport his produce to the consuming public. He said that the old idea of the farmer was obsolete, and that the coming in of the all-year-round passable highway with free rural mail delivery has put the farmer close to the market and with his daily papers, his daily market reports and a quick receipt of the best magazines and papers, he now has become one of the best posted classes of the whole country.

Mr. Hartman pointed out that the modern all-year road wherever it has been built has robbed the railway of practically all the well-paying short-haul freight, and that the establishment of gasoline vehicle lines was doing much to bring about a healthy back-to-the-farm movement. Putting his finger on one of the major handicaps of modern business, he declared that the trouble throughout the Dominion and the United States is that the freight rate is too high, having not yet been reduced from the rate induced by the war, and while admitting that good highways take away some of the business of the railways, Mr. Hartman said that the railroad would in the end reap its full reward if husbandry was properly fostered.

The next speaker was J. A. Duchastel, manager and city engineer of Outremont, who dealt with the subject of "Foundations." In a clear and concise manner he pointed

out the importance of so beginning the work of road building as to the substructure that that portion of the road will not require construction where the surface wears out. In other words the base should be of a most permanent character particularly on all hard surfaces, and so related to the surface that the latter can be renewed from time to time as it wears out, without disturbing the former.

During the afternoon another contingent from Ontario arrived, in the persons of the Premier, the Hon. E. C. and Mrs. Drury, the Hon. F. C. and Mrs. Biggs, Minister of Public Works, W. A. McLean, a past president and now deputy-Minister of Highways of Ontario, and others. As to the popularity and attendance the crowning event of the convention was the banquet held in the beautiful hall of the Empress Hotel. The setting with the abundance of golden broom and other flowers, for which Victoria is famous, was charming and the entertainment provided by the committee was delightful.

At the head table were seated, among others, His Honor the Lieutenant-Governor Walter C. Nichol, Premier John Oliver, Premier E. C. Drury, Hon. J. L. Perron, K.C., the president-elect of the association, and other notable leaders in the good roads movement in Canada and the United States.

Banquet

Over three hundred guests sat down and the Hon. S. J. Latta, the retiring president, presided as toast-master. After the toast to the King, Mr. Latta, in a very characteristic and eloquent manner, delivered the speech of the evening, and said, in part: "Propaganda for good roads is justified not alone by economic reasons, because good roads will make it easier for all of us to make a living, but because the building of good roads is one of the greatest socializing things we can strive for. Probably we in the interior provinces can appreciate these influences better than you can in British Columbia, but on the prairies we have scores of races represented in the population, men and women with different ideals, different view points, and different methods of living; and by prosecuting our good roads propaganda we are bringing these people together and giving them a common ideal and purpose that will make for a greater and better Canada. Good roads, by making all our people neighbors and better friends, are building for us a consolidated national settlement."

The Lieut.-Governor, W. C. Nichol, welcomed the delegates to British Columbia. We in this province have our own problems and anxieties, said Mr. Nichol. We are working in our own way to make this a greater province. The comparative harmony we enjoy in this work indicates that the real heart beats true, and we believe that ultimately this province will be regarded as one of the greatest outposts of the British Empire.

The toast to "Our Governments" was replied to by Premier Oliver and Premier Drury. Mr. Oliver commended the Good Roads Association for the service it was rendering in making known the highway needs of the country and spreading information on the subject. He agreed with Mr. Latta as to the importance of welding together the diverse interests of Canada and stated that if all the good qualities of the various races represented are to be welded together, there must be a welding flux, that flux is equity, truth and justice, and the application of the Golden Rule in government. Premier Drury referred to the Good Roads Association as an agency of international value because of its influence in bringing together the forward-looking people of the United States and Canada, and declared that the most important thing in the world is the continuance of friendship between the Anglo-Saxon nations. We have built on one foundation and we have one set of ideals to give the world. Mr. Drury told how in Ontario the government had sought to build roads so as to adequately serve the needs of all elements of the population. Some are either apathetic or opposed to the movement, others are so urgent that they want a road built over night and in addition to these there is the question of costs which gives those responsible much to worry about. The province, he

said, assumed the cost of roads carrying through traffic while the municipalities with government aid paid for the roads of a local character. The motor license fees went a half to financing and a half to the cost of maintenance. He believed, he said, in progress, but in sane progress. There can never be roads that are too good, but we know too well that there can be roads that cost too much.

The toast to Canada was fittingly replied to by the Hon. J. L. Perron, the president-elect, who, in an eloquent manner paid a high tribute to the entertainment committee.

A. P. Sandles made an appropriate reply to the toast to the United States, and eulogized the work of the executive, laying special stress on the work done by Mr. Squire and by the secretary, Mr. McNamee.

"The Press," was responded to by Mr. Nichols, editor of the Victoria Times, who expressed his sympathy with the aims and objects of the association and congratulated the members on an interesting and successful convention.

Ald. R. W. Perry responded for "The City," in a very hearty manner, and hoped that the delegates would all soon come back to stay.

Mrs. R. Baird and Mrs. H. Briggs with Mrs. A. J. Gibson, delighted the gathering in song, while sing-songs were led by Mr. Webb and Mr. Killey.

The Empress Hotel Orchestra rendered selections which were enjoyed by all.

During Thursday and Friday, by the generous arrangements of the entertainment committee, the delegates were taken on sight-seeing tours. The grandeur of the far-famed Butchart Gardens will never be forgotten. They so far exceed even the imagination that one would not attempt to describe them. Added to this was the cordial hospitality of Mr. and Mrs. Butchart, which was entirely in keeping with the scene. The scenic beauty of the renowned Malahat Drive, known to all motorists of the coast, was greatly enjoyed, and the visitors received an impression as to the beauties of the island, its rich and productive soil, and above all its delightful and hospitable people that will linger long in the memory.

Thursday Morning Session

The morning session was opened promptly by Hon. G. S. Henry presiding. The first paper was read by John S. Crandell, consulting engineer of the Barrett Co., New York City, on "Roads and Pavements for Average Conditions." This paper will appear in a near-by issue of "The Canadian Engineer." The other paper read at the morning session was on "Road Dragging and Maintenance Competitions," by Hon. H. S. Carpenter, Deputy-Minister of Highways, Province of Saskatchewan.

The papers scheduled for the afternoon session were taken as read in order to allow the delegates to participate in a motor tour of the Saanich Peninsula and a visit to Butchart's Gardens. The addresses presented at the close of the convention were by A. S. McMillan, superintendent of highways for Nova Scotia, who dealt with construction of bridges and culverts; William Findlay, of A. McKim, Ltd., Toronto, whose paper was devoted to methods of financing road construction, bonding and revenue.

With the conclusion of the business of the Association, many of the out-of-town delegates started on their homeward journey, although a considerable number remained in Victoria a day or so longer. The convention was most satisfactory from every point of view. The subjects discussed were most interesting to those connected with highway construction. The spirit which pervaded every session was most delightful and profitable and it was left by all who attended that it was the best convention ever held.

The following resolutions were among those presented at the Thursday morning session by the Committee on Resolutions:

RESOLVED: That this Association re-affirm its approval of the principle of Federal aid, the Provinces of the Dominion having undertaken comprehensive road policies because of Federal aid, and as improved roads are a great national asset, and have a direct and definite relationship to agriculture, immigration, colonization, and transporta-

tion: and since these are of great importance to Canada as a Nation, the Federal Government is justified in continuing financial assistance to the Provinces in the building of all main or through roads, and that any Province, at the expiration of the time limit set forth by the present act respecting "Federal Aid," which may not have been able to take full advantage of the allotment for that particular Province, owing to labor and financial conditions, shall be entitled to an extension of time. Such extension shall not interfere with any future Federal assistance.

RESOLVED: That this Association go on record as approving the principle of provincial autonomy in matters of road building;

(1) That in the selection of routes or of roads to be improved same to be made with the following in view:

(a) Local service.

(b) Eventually co-ordinating the roads within the province that the system when completed, may form a comprehensive whole and that Inter-Provincial Roads be made a part of such plan.

(c) That roads be built economically, and of such standard or type as may best meet the traffic, which they must bear.

(d) That roads when improved, shall be maintained.

Delegates at Convention

The following is a list of delegates attending the Good Roads Convention:

James Allen, supervisor highways, Olympia, Wash.; F. H. Auld, Deputy Minister of Agriculture, Regina.

James R. Agar, president New Westminster Auto Club; F. W. Anderson, M.P.P.

Robert Bremond, Toronto; C. Brakenridge, consulting engineer, Vancouver; H. Frank Bird, secretary Good Roads Association, Vancouver; Hon. E. D. Barrow, Minister of Agriculture; J. T. Brandon, secretary S. P. C. A.; John Blue, secretary Edmonton Auto Club, Edmonton; J. C. Brady, district engineer, B. C. Department Public Works.

town, P.E.I.; Senator O. H. Colfox, Washington; R. H. Cameron, Toronto; C. E. Cartwright, civil engineer, Vancouver; J. O. Cameron, Cameron Lumber Co.; H. H. Cook, Toronto; M. P. Cotton, Engineers and Contractors, Vancouver; Prof. K. A. Clarke, research engineer, University of Alberta, Edmonton; J. R. Colley, third vice-president, Good Roads Association, Kamloops; A. L. Carruthers, district engineer, Provincial Department of Public Works, Prince Rupert; A. J. Clark, Vancouver; H. S. Carpenter, Deputy Minister of Highways, Regina; A. W. Campbell, Dominion Commissioner of Highways, Ottawa.

Hon. E. C. Drury, Premier of Ontario, Toronto; James Duncan, municipal engineer, Holyburn, Vancouver; R. G. Davidson, Portland, Oregon; A. Dixon, district engineer, Department of Public Works, South Fort George; A. J. Donahue, president of Alberta Association of Municipal Districts, Calgary; Dr. P. E. Dochittle, president Auto Association, Toronto; W. J. Dawson, manager, Gutta Percha Rubber Co., Winnipeg; J. A. Duschastel, chief engineer and manager, Outremont, Que.

W. H. Easterbrook, chairman Roads Committee, Wentworth County, Aldershot, Ont.

W. G. Fowler, manager, Gutta Percha Rubber Co., Vancouver; R. Fenton, Calgary; A. E. Foreman, district engineer, Portland Cement Association, Vancouver; T. H. Fellows, district engineer, Vancouver; F. W. Farness, Superintendent of Works, New Westminster; J. A. Flanagan, Conservation Commission, Malone, New York; J. P. Forde, district engineer, Department of Public Works of Canada, Victoria; J. W. Finlayson, Prof. C. E. ManiFullerton, Supt. Roads, Toronto.

W. K. Gwyer, district engineer, Penticton; W. B. Greig, Point Grey; W. A. Gourley, engineer, Canada Highways Commission, Victoria; R. H. Gale, president Good Roads Association, Vancouver; Percy Gomery, Vancouver; E. R. Gilley, engineer, Gilley Bros., New Westminster; Professor

R. H. MURRAY

Director, Canadian Good Roads Association

S. L. SQUIRE

Past President, Canadian Good Roads Association

GEO. HOGARTH

Director, Canadian Good Roads Association

Cranbrook; H. H. Bigwood, chief draughtsman, Public Works Department; Col. John Balcharrle, Ottawa; J. W. T. Blackman, city engineer, North Vancouver; Hon. F. C. Biggs, Minister of Public Works, Toronto.

J. W. Cunningham, treasurer Good Roads League, New Westminster; J. K. Clark, Supt. Expt. Station, Charlotte-

ville, N.Y.

C. B. Huyck, manager Mussen's, Ltd., Vancouver; Col. A. E. Hodgins, district engineer, Victoria; Hon. John P. Hartman, Seattle, Wash.; Geo. L. Henry, Todmorden, Ont.

Frank Hobbs, Cadboro Bay; R. K. Houlgate, president Vancouver Board of Trade, Vancouver; J. H. Hodgson, Wentworth Suburban Highway Commission, Hamilton; J. B. Harkin, Commissioner of Dominion Parks, Ottawa; S. R. Henderson, president Manitoba Good Roads Association, Winnipeg; Alderman Harvey; L. B. Howland, vice-president C.A.A., Pasadena, California; J. B. Holdcroft, Victoria; Hon. George S. Henry, Toronto; John Haddon, president Manitoba municipality, Winnipeg.

David W. Johnston, municipal engineer, South Vancouver; John B. Jardine, New Westminster; P. J. Jennings, Assistant Commissioner of Irrigation, Department of Interior, Calgary; J. H. Johnson, Burbrook, Ont.; W. J. Jackman, Bremner, Alta.

R. T. Kelley, first vice-pres., Good Roads Association, Hamilton; C. E. Kendall, Rep. Watrous Engine Works, Vancouver; Fraser L. Keith, Secretary Engineering Institute of Canada, Montreal.

Hon. S. J. Latta, Minister of Education, Regina, Sask.; Prof. A. T. Laing, Professor Highway Engineering, Toronto University, Toronto.

W. L. Macken, president Associated Boards of Trade, Chilliwack; G. T. Maurice, Inspector S.P.C.A.; H. B. MacKenzie, highway engineer, Public Works; G. C. MacKay, district engineer, P.W.D., Quesnel; Hon. A. M. Manson; J. A. McIver, Reeve of Maple Ridge Municipality, Port Hammond, B.C.; Chas. A. Mullen, consulting engineer, Montreal; Prof. E. G. Matheson, Professor of Civil Engineering, University of B.C., Vancouver; T. J. Mahoney, Chairman, Hamilton Highway Commission, Hamilton, Ont.; F. L. Macpherson, B.C.P.W. Department, Victoria; J. B. Moon, Vancouver; Geo. A. McNamee, Secretary-Treasurer, Canadian Good Roads Association, Montreal; Geo. McNamee, Jr., Outremont, Montreal; H. J. Mackay, Ashcroft, B.C.; J. M. McCutcheon, Toronto, Ont.; A. F. MacCallum, Commissioner of Works, Ottawa; W. A. McLean, Deputy Minister of Highways, Toronto.

Nels Nelson, New Westminster, B. of T.

Hon. John Oliver, Premier of British Columbia, Victoria.

Wm. Pearce, Department of Colonization and Development, Calgary; G. Parkinson, Port Renfrew, B.C.; H. M. Pugsley, Richmond Hill, Ont.; Guy Perron, Montreal, Que.; Patrick Phillip, Public Works Engineer, Victoria; W. E. Payne, Secretary Vancouver Board of Trade; Hon. J. L. Perron, Minister of Public Works, Montreal.

C. M. Rolston, Vancouver; Chester Reitze, assistant general manager, Portland Cement Association, Seattle.

S. S. Rose, Brantford, Ont.; A. A. Ross, Vancouver; W. G. Robertson, Sec.-Treasurer, Ontario Motor League, Toronto; F. R. McD. Russell, vice-president Pacific Highway Association, Vancouver; A. M. Rankin, Collins Bay, Ont.; D. M. Roy, Dunlop Rubber Co., Toronto; T. Rogness, resident engineer Road Association, Fernie, B.C.; J. D. Robertson, Deputy Minister Public Works, Edmonton, Alta.; Wm. Ramsay, district engineer, Department of Public Works, Nelson; Hon. Alex. Ross, Minister of Public Works, Edmonton, Alta.; F. Lorne Roe, Good Roads League, Penticton; J. T. Robinson, Kamloops.

S. L. Spilre, Chairman Executive Good Roads Commission, Toronto; J. Scott, Manager Dunlop Rubber Co., Vancouver; A. P. Sandles, Good Roads U.S.A., Columbus, Ohio; Fred J. Spalding, Commissioner Tourist Association, Fernie, B.C.; Harry Stewardson, city engineer, New Westminster; Roy Sweeney, Kelowna Auto and Good Roads Association, Victoria; Hon. W. H. Sutherland, Minister of Public Works, B.C.

G. W. Turnroos, civil engineer, Vancouver; L. Netta Turnbull, Vancouver; Jack Turgeon, Montreal; Thos. H. Tracey, Vancouver; Frank Terrace, Good Roads Association, Orillia, Ont.; E. Tomlin, B. C. Cement Co., Victoria.

H. S. Van Scoyoc, Canada Cement Co., Montreal; E. H. Verner, district engineer, P.W.D., Port Coquitlam; Thos. W. B. Vermand, Ontario Motor League, Toronto; E. R. Vigor, Vancouver.

L. Wright, Hamilton Chamber of Commerce, Hamilton, Ont.; Geo. H. Webster, Calgary; G. B. Whitehead, district engineer, B. C. Public Works, Kamloops, B.C.; J. M. Wardell, chief engineer, Canadian National Parks, Ottawa; Frank G. Woodside, Vancouver; Fred L. Wolf, State Representative, Newport, Wash.

A. A. Young, engineer, Winnipeg.

B.C. FOREST PRODUCTS BUREAU

WITH M. A. GRAINGER as secretary and manager, the Forest Products Market Extension Bureau of British Columbia has been organized by the lumber and shingle interests of that province. Offices have been opened in the Metropolitan Building, Vancouver. Following is the Bureau's general outline of its proposed activities:

1—Investigation of new markets which are now opening up for British Columbia products, such as the Japan market.

2—Assistance to salesmen and manufacturers by practical work in existing markets, such as the four-billion foot market for shop-grade lumber in the wood-using industries of the East and Middle West, in which British Columbia material as yet has hardly gained a footing.

3—Making the value of British Columbia products known through general publicity, exhibits, pamphlets and personal work of field men among buyers, contractors, architects, railroads and other large users of wood.

4—Combating propaganda aimed by steel, concrete and roofing substitutes against wood products; opposing anti-shingle legislation and securing just treatment of Western woods in city building codes.

5—Advising manufacturers regarding desirable changes in character of output to take advantage of new lines of market demand, and regarding possible improvements in selling methods. Assisting the movement for better standardization.

6—Compiling practical information for both producer and consumer and maintaining a prompt news service regarding trade openings.

7—Assisting timberholders by studying market possibilities so as to make closer utilization of stumpage practicable, as for instance by strengthening the demand for West Coast hemlock.

8—Educational work around logging operations to promote the most profitable cutting of logs for grade and length.

Applying a coating of concrete by the method known as "Gunlite" consists of projecting a fine spray of cement combined with water, and a high pressure from a special apparatus, the "Cement-Gun." From tests applied by the University of California as to the rusting of steel in concrete, it would appear that "Gunlite" possesses certain acid resisting qualities which are of considerable value. A tank treated with "Gunlite" was subjected to 10 per cent. sulphuric acid at 200 deg. Fah. for 136 continuous days before the tank broke down through failures at the corners. "Gunlite" would appear to be specially valuable as a protection for concrete girders and columns exposed to the atmosphere or dampness, and it also possesses fire-proofing qualities.

The engineers of the Manitoba Power Co. have announced that by Christmas of this year the first unit of the 170,000 h.p. development project at Grand Falls will be completed, and the power delivered in Winnipeg. This company is a subsidiary of the Winnipeg Electric Co. and the new hydro-electric project will, it is estimated, cost \$7,500,000 to complete, and will do much to provide for the electrical needs of the city of Winnipeg for years to come.

FEDERAL AID, ITS IMPLICATIONS AND RESULTS*

Federal Aid Towards Road Improvements—Co-Operation Between Federal and Provincial Governments— Contracts Versus Day Labor.

By A. W. Campbell,
Commissioner of Highways, Ottawa

WHERE has been established in every province in Canada during recent years, a new department or branch for the administration of advanced legislation on road construction and maintenance. And since 1919, the Canadian Government has been an interested partner in the development of improved facilities of travel on the more important roads, by reason of the Canada Highways Act.

For some years past the tendency has become pronounced on the part of local authorities and also of road users, to look to the several provincial governments for

assistance in providing the country with adequately improved highways. The injustice and inequity of the old burden of having to build for traffic originating outside the limits of local administrative units, have lead to the assumption of responsibility for road improvements in many directions. Hence Federal aid towards the betterment of the roads required to sustain heavier and speedier traffic.

Every producer is beneficially affected by the increased facilities for road transportation

and the Canada Highways Act, 1919, was intended as an instrument of reconstruction, and as such, its value should in part be judged. The chief result of this piece of legislation is that good roads have a very important place in sowing the seeds of national prosperity.

As a matter of fact, Federal aid as authorized by this Act, was the crystallization of many forces, the aim of many conferences and the subject of many a wayside parliament. It was, of course, generally recognized that as the primary avenues of highway travel are improved with government assistance, the lesser travelled roads must receive greater attention and care. Any general impetus to betterment inevitably creates ripples of betterment to the outermost rim of the country's transportation system.

Although the amount of Federal participation in highway construction and improvement is only 40 per cent, of the total necessary and reasonable cost of the selected system of roads receiving aid, there has been a certain amount of co-operation and collaboration with the different road-building authorities of this country, not without their value.

Measures of Co-operation

One of the advantages of having a five-year term during which the Federal appropriation of \$20,000,000, may

*Paper read at the ninth annual Convention of the Canadian Good Roads Association, Victoria, B.C., June 12 to 15, 1922.

be earned, is the possibility of the establishment by each province of continuity of policy no talone in the administrative or executive branch of a department, but also in the highway engineering branch. Any policy of road development cannot well be carried out unless there have been created adequate road funds and an engineering staff properly organized and imbued with the aims of the executive branch. It has been the aim of the Federal department to give moral support to a provincial department that is trying to build for the future, rather than provide shoddy surfaces upon open web foundations and structures requiring constant repair or replacement.

Under the regulations, the provinces are asked to submit a map of a selected system of their main and market roads which they propose to construct with Federal co-operation. In this connection, the importance of seeing that Federal-aid roads shall serve distant as well as adjacent territory, and that they shall link up properly, has not been lost sight of. In this work, direction of which is seen by the provinces concerned to be necessary, co-operative measures are all that is required.

The fact was recognized when the regulations were being framed, that dual inspection of all the operations on Federal aid highway projects was not necessary. Each province is quite as much concerned with the importance in the public interest, of honest work, honestly done as is the Federal Department, and, therefore, a certain emphasis was placed on the importance of seeing that the chief officials having to do with the layout and control of the operations on roads of the magnitude now necessary, have had the training and experience to qualify them to meet the problems arising daily on such work. If the foreman and inspectors have been imbued with the public service idea and the necessity in the public interest of expecting one hundred cents on the dollar in value of workmanship and materials, there would seem to be no good reason why duplicate inspection on behalf of the Dominion Government is necessary. Still, there have been established four inspectorships for Federal-aid highway work, with inspectors whose chief business is to determine the reasonable and necessary cost of the work, and incidentally to co-operate as far as possible with the different provincial district or divisional engineers, by offering constructive rather than critical suggestions. Experience shows that careful investigations into costs of operations involving many variables of quantities and prices are not without their reactions and beneficial effects.

Actual costs are of course determined by travelling auditors of the Federal Department, from examinations of vouchers of outlays made with respect to all projects under agreement. The auditors advise me that they have been welcomed by the different provincial accountants, and in many cases have been asked for their advice on distribution of accounts, etc. That savings have been effected to the provinces as a result of the discovery of accidental over-payments to contractors, for example, need hardly occasion surprise.

One of the items of collaboration is in securing proper records of every Federal aid project. The importance of the recording of investigation data, including photographic records, showing the conditions that have governed recommendations for given types of construction, has not been sufficiently appreciated by some road-building authorities. Records of the condition of the road in bad weather, of the type recommended, of the need for the road, of the dates of completing surveys, of call for tenders, of recommended dates for commencement and completion, they all should form an important chapter in the history of each road. Similarly, the recording of the process of development of these roads should be made the subject of library-record method.

Classification of Roads

When the different provinces were asked, as a preliminary to enter into agreements for Federal aid, to submit a map of a system of main and market roads, in some cases there was delay owing to the necessity of making

A. W. CAMPBELL
Commissioner of Highways, Canada

a selection that would be acceptable to all parts of the province concerned. The question then arose,—"Are not all our roads important?" In order to answer this question it became necessary to conduct some form of investigation of the amount and character of the traffic using all their roads. Traffic studies showed the existence in each province of a number of roads which when connected up by a fairly uniform type of construction, might properly be called main trunk roads; these roads forming the skeleton arterial system then carried the bulk of the traffic. Traffic studies also showed addition a number of trunk roads of lesser importance that might be called secondary trunk roads, and then there was the purely local country road system. Market roads include all three classes, and any local road that does not serve to link farm and market effectively fails in its real purpose. In this connection, it is significant that the aid is extended under the regulations not to main market roads alone but to main and market roads.

One of the results of the classification of the different roads of the province, shows that there has been created in many of the provinces a special primary road system fund to be expended on a selected system of roads. The amount of money left for expenditure on the roads of lesser importance has in many cases increased. Formerly one could not distinguish, in fact, it was generally inexpedient to differentiate in the amount of expenditure and the quality of the work done on the roads in different part of a province. The result of financing, from earmarked funds, the cost of improvements on the primary road system, is that it is possible to build for the future, especially in providing wide grades, adequate drainage structures and outlets, and more permanent types of surfacing.

Preliminary Information

Securing complete information, in advance of the period of undertaking actual construction, by careful studies of the traffic to be accommodated and surveys of the improvements called for, are matters of the utmost importance in controlling costs. Good sound common sense suggests the expediency of securing all possible information well in advance of the proper time for doing the work. It is advisable to have carefully prepared estimates so that they will be a safe guide when awarding contracts, and in the engineering direction during construction, and also the amount of work actually involved in the contract. In too many cases the amount of work done under a given contract has largely exceeded that contemplated when the contract was let. This suggests either careless or insufficient surveying of the proposed work. Revisions of the estimated costs of projects should, with exceptions, with the present trend of prices be downward rather than upwards.

Control of Labor Employed

In reply to a question asked the different provincial departments as to whether the numbers of parties and concerns apparently interested in road construction projects had increased since 1919, every province advised that there had been a greater number of tenders received on an average than formerly. The requirement of the Act that all Federal-aided work shall be done by the tender and contract method, except for special reasons, has undoubtedly been a considerable factor in this regard.

Several provinces have done considerable work, especially grading, the drawing of materials, and lighter surfacing by the days labor method. When this method is used the handling and direction of the labor employed should be done with the same efficiency as if the work were let to contractors. The public interest is wider than the personal inclinations of the labor crew employed on work of highway betterment. Competition or possible competition for the work to be done is always a desirable incentive to the giving of good value for outlays whether as between one contractor and another, or between day labor men.

As a general rule when the provinces have asked for the approval of the Governor-in-Council for day labor work

on any project, the reasons commonly given are,—the work is not large enough to warrant calling for tenders and making the necessary surveys, or the contractors are not interested, or it may be done more cheaply than by contract method. While it may be conceded that it is good business to do certain work by day labor, yet a careful study of the different methods suggests that in the substantial improvement of roads of primary importance, there is real economy in having all the results of traffic studies, surveys, and the definite information required in letting contract work, in the hands of the department before the work is undertaken, even though it be done by day labor. This is the only way in which a reasonable estimates of what the actual cost will be, can be ascertained, or actual comparisons made between costs of different methods of construction. The arguments in favor of day labor work above referred to, may apply to road work ordinarily, but in construction of the magnitude and substantial character now required and being undertaken, much care should be employed in determining which method should be employed. There is, frankly speaking, much suspicion as to the selection of the men, the honesty of the work performed, and the value of the work received in the case of day labor work.

A Word of Warning

It is within the experience of nearly all who have to do with the administration of highway legislation, to realize how greatly public sentiment has changed with respect to the amount of justifiable outlays for road improvement, and it is in connection with this sudden change that I wish to give a word of warning.

The ordinary gravel or macadam road costing from \$1,000 to \$5,000 per mile has suddenly been replaced by cement concrete, asphalt, and the very highest types known today for road improvement. These types of construction cost from \$20,000 to \$40,000 per mile. From this one can grasp the meaning and seriousness of the highway improvement problem as it affects the whole country. Where thousands were referred to a few years ago in regard to road betterment millions are now involved. The result is that provincial departments of highways have now become great spending departments of the government. And this work as yet is still in its first blush in Canada; it is new, and to some extent still novel. Large sums are now required for construction; in a very short time huge sums will also be required for keeping the work completed to the original standard.

Maintenance

Although many articles have been written and much has been said at good roads conventions about the wisdom of proper maintenance work on roads in the name of good business and service to the people, yet it is surprising to find how generally maintenance is neglected, or performed in a haphazard fashion, without organized method. We may learn much from railway practice in this regard. In railway organizations, construction and maintenance-of-way are two separate and distinct departments; while their problems and methods are related they are essentially different. The construction gang works under scientific direction, while the maintenance patrol is more or less an independent unit using discretion and judgment as to when and where patching is required. In both departments there is a responsible chief at the head who receives periodical reports on conditions and progress, and administers a definite appropriation. I would respectfully suggest that the time has now come when this Convention might go on record in favor of the establishment in each provincial department of a separate branch having to do only with maintenance work. I believe that many of the commissions of highways, and highway departments in the United States have a division for maintenance work only, and that such divisions have an annual budget of respectable proportions depending, of course, in many cases upon how well the construction divisions have been permitted to do their work.

The cost of administering maintenance funds and of providing roads uniformly good, depends upon the type, but more particularly upon rigid adherence to type specifications in the original construction. Inferior construction on a road of primary importance is the most costly in the end. With good construction the necessity for second or third year reconstruction is obviated and general patching and replacement eliminated, thus maintenance charges can be controlled.

The federal aid highway agreements require an undertaking to maintain the completed project, with all necessary repairs and renewals, so as to preserve the standard of each particular type of construction, and, pending the submission of the necessary information regarding unimproved sections of a project, to maintain or cause the same to be maintained in an efficient manner.

Development of Motor Transport

Greater attention to maintenance work on highways has been necessary on account of the enormous development of the fast-moving pneumatic-tired traffic in the more settled parts of the country. The heavier vehicles, particularly solid-tired vehicles, unite to disintegrate and then to grind to powder, waterbound macadam and poor gravel roads. Canada has now one motor vehicle to every nineteen persons and, according to service, possibly one to every five. Since 1915 the total registrations have increased five times over.

Increased Expenditure General

Canada is not alone in having to find means for a greatly enlarged activity in road building and upkeep. All the leading countries of Europe, including Great Britain, are annually spending large sums from national revenues in constructing or in improving roads. In the Mother-country a tax on motor spirits furnishes a revenue for this purpose, which is granted in aid by the Ministry of Transport towards worthy projects. In the United States Federal aid to the extent of \$384,000,000 has been voted by Congress since 1916, an average of \$64,000,000 a year. It is reliably estimated that the average annual expenditure for road improvement in that country is nearly \$7 per capita, or about twice the amount being raised in Canada for like purposes.

Result of Increased Activity

Nevertheless, Canada is gaining a reputation for good roads abroad. The records of the Customs Department indicate that the total number of entries of motor tourists from the United States for periods varying from one day to six months is about a half million for last year, and that the total number entering for one month or longer has doubled in the last two years. A remarkable feature of this tourist traffic is the number of cars that have crossed the continent before crossing the border. Of the 29,000 odd cars entering British Columbia, 57 cars from nine different States bordering on the Atlantic and 765 came from States of the mid-interior. Doubtless, a corresponding number of our cousins from the American West motorized to Eastern Canada; some returning to revisit old family scenes of their youths.

With regard to the progress being made in connection with the Canada Highways Act, you will be interested to know that within a brief period of a little short of three years each province has been able to so classify their roads as to single out a plan of trunk provincial highways, such as called for by the Regulations. To date 204 agreements for Federal aid have been authorized for 5,125 miles of road at an estimated cost of \$29,461,515. The total amount of the provincial expenditures audited with respect to this work is \$15,974,591, and the total amount of payments made with respect thereto is \$5,179,275. The total mileage of completed Federal aid work at the end of the year was 1,400 miles, and the mileage under construction was 2,397 miles.

HIGHWAY AND TRANSPORTATION PROBLEMS*

Review of Good Roads Situation in Prairie Provinces—
Construction, Drainage and Maintenance—Road
Building a Co-Operative Enterprise.

By Hon. S. J. Latta,
Minister of Education, Saskatchewan.

BECAUSE of the lack of good roads and improper land settlement, the cost of the transportation of produce to railway points is often far in excess of the cost of railway transportation. It is asserted also by those who have given the matter consideration that the railway traffic at country points falls off in many cases to as much as 50 per cent. during seasons when the roads are, as a consequence, unfit for travel. The absence of proper road communication is probably the most serious handicap, both to those who have money invested in railway industry and to those who live upon the land. In fact, no railway system can serve the people for whom it is constructed to the maximum of efficiency unless co-related with it there is developed and maintained a system of good roads.

Over in our great Province, Saskatchewan, there are 210,000 miles of road allowances, a strip sufficiently long to encircle the globe eight times and have a few miles left over at that. On the principle that 80 per cent. of the traffic passes over approximately 20 per cent. of the road mileage, there are in Saskatchewan's system over 30,000 miles of main market roads, here again sufficient to go round the globe once and back again to the Old Land.

The population of a little less than 800,000 is spread over an immense area. In 1911 the density of population was 1.95 people to a square mile.

The land area of the three Prairie Provinces is estimated at 371,000,000 acres. Over 121,000,000 acres have been disposed of, including 60,000,000 for homesteads and 38,000,000 of Hudson's Bay Company land.

About 17 per cent. of the land disposed of is under cultivation. In these Provinces within 20 miles of a railway there are over 15,000,000 acres of excellent vacant land, over 12,000,000 acres within 15 miles, nearly 9,000,000 acres within 10 miles and about 4,500,000 acres of fertile vacant land within 5 miles of railway facilities.

Great Individual Cost

Look at the problem then from another angle. Only a bit of calculation is necessary to disclose the fact that upon a family of four people, less than the average, is shouldered the enormous responsibility of building and maintaining one mile of roadway, and upon five average families the construction and maintenance of a mile of main market highway.

The economic use of land in a general way seems to have been regarded as least incidental rather than essential. This system tended to the marking out of too many miles of road because there are more miles of road than, on the most liberal estimate, the taxpayer is able to construct properly.

The rural percentage of population in Saskatchewan fell from 80.7 in 1901 to 73.3 in 1911, and further to 73 in 1914. In Manitoba it dropped during the same period from 72.4 to 44, in Alberta from 71.8 to 60, and in British Columbia from 49.5 to 44.6. In Ontario there was also a decrease of 4 per cent. These figures relative to the rural population are quoted, not with any desire to depreciate the value of the urban, but rather to provide material for consideration in the development of an all-round and well-balanced population.

The development and location of our railway systems have had a very material effect upon the location of our population and the development of our natural resources. No particular blame is attached to any one be-

*Presidential address at ninth annual Convention of the Canadian Good Roads Association, Victoria, June 12-15, 1922.

cause of the failure of this work to accomplish the maximum of good. Had the present generation been entrusted with the task of those of earlier days without the experience of the past, many of the mistakes of earlier days better, but because those of the present have the experience of the past, many of the mistakes of earlier days must be avoided. In future, railway systems, if the maximum of good is to result, must be scientifically planned, duplication must be avoided, and location must be attended, so that localities fit for development may be populated. In short, the wise railway policy of the future, both in the interest of the settler and the railway capital invested, will be such as to make the location of lines conform to a previously considered and scientific plan of land settlement and rural and urban development.

Factors Governing Types

In dealing with the type of road to build, the same principle has been expressed in many ways, but could be summed up by stating that the type of road to build on any part of a system is that type which will carry the traffic which will go over the road at the least possible expense, direct or indirect. In other words, there must always be recognized the close relation existing between the type of road chosen and the quality and quantity of the traffic going over it. It is bad business to put \$20,000 a mile into a road over which the traffic is light and equally bad business to be content with a one thousand-dollar road where the traffic is very heavy.

What has been in a very general way is applicable also to the choice of type of culverts and bridges. There are instances of a very expensive and high type bridge being the least economic type to choose for a certain location, and, on the other hand, where it may be false economy to build a low type bridge at small cost. All kinds of bridges and culverts may be as scientifically correct as all kinds of roads.

Road Construction

During the past number of years it has been my lot to consider the highways problem in its wider aspect. Details of construction have been left to the ingenuity and efficiency of men trained in engineering and practical road building. My observations, however, have caused me to arrive at certain general conclusions regarding the construction of roads.

Drainage to me is the great thing. Without proper drainage a road otherwise well constructed cannot serve its purpose to the maximum. If it were practicable to smooth down a stretch of roadway, then build a tent over it, so that it might be always dry, 90 per cent. of traffic trouble would disappear. Drainage in the matter of construction is of paramount importance, and the greatest ingenuity of the best engineering skill ought to be directed to this end. Whether the type be of a low grade earth road or of the highest type of hard surface, road drainage is equally important. The expense saved in the neglect of proper drainage is money wasted in the matter of construction. Just as much engineering skill of its kind is demanded in the proper construction of a low type road as in that of a high type.

Herein is laid the foundation for the road of higher type at once the population and traffic demand it. If the foundation be not well laid, then the capital expended has been expended in vain. Sometimes it may be impossible to do so, but in every single case where at all possible, every single dollar spent, ought to be so spent as to be useful as soon as the surfacing for a higher type is demanded.

Maintenance

One of the greatest problems of the present is that of proper road maintenance. It is simply appalling to consider the enormous sum of money in the aggregate already invested in Canada's road plant, and at the same time to view the neglect in the aggregate of effort to preserve the capital thus invested. Here, again, the matter is of equal importance whether the road is of high or low type.

I do not believe, as some have stated, that the money spent in the maintenance of the much maligned earth road is money wasted. The money not spent in the maintenance of the low-type earth grade is the money wasted. Just as it is economically on some parts of a system to choose an earth grade to suit traffic conditions, so it is true economy to keep the earth grade in good repair.

Organization for road maintenance all over Canada is only in the pioneer stage, and an exchange of experience along these lines ought to be profitable indeed. It is a subject, on the whole, fit and proper to engage the attention of all organized bodies having to do with higher construction all over Canada.

Financing Roads

Next to education, the financing of highway construction is probably the largest problem with which the Canadian taxpayer has to deal. The enormous expense, direct and indirect, of transportation, railway and road, calls for the consideration of the best brains in finance and construction that Canada is able to produce.

All over the continent of America, in every State of the Union and in every Province of Canada, Governments, Federal, Provincial and municipal, are appropriating millions for the construction of roads, a fact that accentuates more than ever the necessity of attention to this element of the problem. Great care is not wasted, as every dollar is needed and every dollar ought must be expended so that the millions are put to the best possible use.

Municipal Responsibility

Generally speaking, the financing of roads is a responsibility, in the main, shouldered upon the municipality. The function of the Provincial Administration is largely directive, educative and assistive. In some provinces the Government has undertaken the responsibility of constructing and maintaining certain provincial highways. The difference in policy, however, is largely resultant upon a difference of conditions or a difference of viewpoint. However the responsibility may be distributed, the burden of bearing the load in the end belongs to the taxpayer.

In the matter of Dominion aid or Provincial aid, it seems to me that certain principles ought to govern the distribution of funds. Road building is a great co-operative enterprise. The taxpayers of any given community, a community, if you will, co-operate with each other in the interest of all. Two elements enter into the method of the contribution of funds to carry on the co-operative enterprise, first, ability to contribute, and second, the benefit derived from the utility provided. If this principle be sound, then Provincial aid to the communities within the Province ought to be given on the same basis. It is quite evident that a basis of population may not fulfill all the requirements of the purposes of co-operation. In like manner it may easily be shown that the distribution of Federal aid by the Dominion Government among the Provinces on the basis of population may be unjust and inequitable.

A sewer over six miles long and running through the most populated sections of the South Shore, and which will cost over \$370,000, and intended to serve Longueuil, St. Lambert, Montreal South and Greenfield Park, is now nearing completion. The sewer is constructed of large pipes, each length of which weighs 20 tons. It commences in Greenfield Park, back from the river, runs to St. Lambert, follows the river-line through Montreal South and Longueuil where an outlet below the Longueuil church site brings it into the river-bed, along which its outfall is laid for 1,360 ft.

The new high level bridges at Hamilton, which will carry the Toronto-Hamilton Highway, will be opened for traffic on July 1. The bridges will not only obviate the necessity of taking the Valley Inn hills, but also will carry the traffic of the Guelph road and the Dundas road out of Hamilton on the level.

DRAINAGE METHODS FOR PRAIRIE ROADS*

Surface and Sub-Drainage—Roads with High Crown not Suitable for Roads in Saskatchewan—Construction of Side Ditches and Culverts—Drifting Soil.

By H. R. MacKenzie,
Chief Field Engineer, Saskatchewan.

THERE are two distinct kinds of road drainage, surface drainage and sub-drainage. Surface drainage is the principal factor in the construction of roads in the prairie provinces. Transverse surface drainage is obtained by crowning the road; the height of crown varying somewhat with the different classes of soil. On roads being constructed in Saskatchewan under the provisions of the Canada Highways Act, the standard height of crown is 6 in. for 20 ft. road surface, or a slope of slightly more than 1-2 in. to the foot. From the proceedings of previous conventions held by good roads associations, we find that a good many engineers recommend a crown slope of 1 in. to the foot, and on heavy clay soil a slope of even 1 1-2 in. to the foot has been recommended, but the writer is of the opinion that those who recommend a high crown on a heavy clay road, have had no opportunity of becoming intimately acquainted with the heavy gumbo soil found on the prairies. After a shower of rain lasting 20 or 30 minutes, it is practically impossible for anyone to drive a car on a road in the gumbo districts with a crown slope of 1 in. to the foot or over.

High Crowned Roads

Owing to the very slippery nature of gumbo when wet, a highly crowned road in this class of soil is impassable in wet weather, but how about its relative serviceability in dry weather? We have long dry periods in July, August and September on the Western plains. The heavy soil bakes hard, cracks and becomes broken into granular particles by traffic, and is thrown out of the wheel tracks by rapidly moving motor cars, with the result that deep ruts develop and the surface is so hard that it is impossible to repair the damage satisfactorily, until the surface is softened by rain. On an excessively crowned road, the traffic is confined to the exact centre of the road surface and consequently the development of deep ruts in dry periods is accentuated. If the road had a reasonably slight crown, traffic would be distributed over the road surface and the maintenance problem would be reduced. Another feature, is the safety of the travelling public. On a high crowned road, cars in passing are always liable to skid into the ditch and upset, even while travelling at moderate speed, whereas on a 20 ft. road with 6 in. crown, cars can pass in safety at any reasonable speed. Still another feature in connection with high crowned roads, is the severe wear and tear on tires. When ruts develop in the centre of road, due to the concentration of traffic at this point, a new track is developed on either side of centre line, forming two definite lines of traffic, and on both of these the rear wheels of motor cars are constantly skidding down the slope, making the driving of a car difficult, dangerous and expensive. A high crown has the serious disadvantage outlined above, and furthermore, is not required for adequate surface drainage. Water will be discharged just as well from a slope of 1-2 in. to the foot as from a slope of 1 in. to the foot, providing the road surface is kept free from ruts by proper maintenance, and grass and weeds are not allowed to grow on the shoulders of the road. When, after a rain, the water has all been carried away and the surface of the road remains smooth with no signs of erosion, the crown slope may be taken as being satisfactory. In the case of excessive slope of crown, small rivulets will appear caused by the too rapid discharge of water.

On steep grades the crown of a road should be increased slightly so as to minimize the danger of water run-

ning down the road surface in a longitudinal direction, an application of sand or gravel being required to prevent skidding in the case of heavy clay soils.

Transverse Drainage

The transverse drainage of side hill roads in Saskatchewan is very often accomplished by having the entire road surface inclined towards the ditch at a slope of $\frac{1}{2}$ to $\frac{3}{4}$ in. per foot of width. This method results in more water being on the road for a longer period than in the case of an embankment where the slope is from the centre towards the side, and also causes a greater volume of water in the ditch with relatively greater erosion resulting. This type of cross-section is used on the provincial highways of Saskatchewan only on sharp curves and heavy side hill cuts where the slope of road-bed towards the hill adds somewhat to the safety of the route. On comparatively straight side hill grades where the transverse slope of hill does not exceed 20 per cent, part of the surface water can be advantageously discharged over the embankment by the crowning of the road surface.

The second stage of surface drainage is the conveying of water discharged from road surface to a natural water course, or to a large slough or lake where the additional volume of water will not cause damage to public or private improvements. The transverse drainage of road surface can be perfectly obtained, but longitudinal drainage is often a very difficult problem in connection with highway construction. To provide ideal surface drainage we require that the side ditches, culverts, bridges and outlets constitute a system capable of draining completely the water from rain and spring thaws as quickly as possible but without erosion. The small number of natural drainage channels, and the uniformity of elevation on the prairie sections of our mid-western province makes longitudinal drainage unusually difficult; also, the absence of trees and shrubs on prairie sections increases the rate at which surface water is discharged, and also increases the amount of the discharge, as compared with treed areas. These conditions, combined with the large catchment basins of our natural water courses, cause extremely severe flood conditions, which make necessary special provision for adequate water way.

Side Ditches

We shall now consider the construction of side ditches and offtakes. Judging from an examination of a large mileage of road, constructed under the supervision of local municipal authorities in the Province of Saskatchewan, it is evident that in a great many cases it was considered that when the road surface was given a very high crown, adequate provision for drainage had been made. The side ditches are often constructed purely for the purpose of securing material for the crown, and the result is elongated ponds, not drainage ditches. This is a very serious mistake, and the emphasis is being put in the wrong place, for the drainage of the right-of-way is of far greater importance than the transverse drainage of road surface. Such sections of road are invariably rutted, unless the embankment is 3 or 4 ft. above water level, whereas under similar conditions of soil and rainfall, the balance of the road is in first class condition.

It is expensive and usually unnecessary to provide long sections of side ditches at a uniform gradient. Most of Saskatchewan is sufficiently rolling that continuous drainage can be provided from each summit to the nearest culvert without any serious difficulty. The gradient on these ditches is not necessarily uniform. On our provincial highways we endeavor to provide for the removal of all water from the side ditches and borrow-plots. We also endeavor to drain, or at least lower, the water level in sloughs which are on the right of way. If the depth of water in the slough exceeds 2 ft. and extends for a considerable distance, and cannot readily be drained, we usually divert the road so as to avoid the slough, having in mind the high maintenance charges on a road constructed through a body of water.

*Paper read at the ninth annual Convention, Canadian Good Roads Association, Victoria, June 12-15, 1922.

The side ditches on roads improved by the Department of Highways are so designed that they can be constructed and maintained by standard road building and road maintenance machinery. The standard depth of side ditches is 18 in. on our provincial highways. In the case of turnpiked sections of road the inside slope of ditch is 4 to 1 and the outside slope 1 1/2 to 1. In the case of a roadway in excavation, the inside slope of the ditch is increased to 3-1 in order to reduce the volume of excavation by reducing the out to out width of roadway, maintaining the same depth of ditch and crown width.

In the case of a roadway constructed around the base of a hill, it often occurs that the roadway could be built at the same elevation for a considerable distance, but as there must be a slope to the side ditch, we construct the road to a slight gradient so that the ditches may be of uniform depth. If a level stretch of roadway were constructed the ditches would be shallow at the centre of the level stretch and too deep at the outlet. In the case of all excavations we provide for a slight gradient to roadway so as to facilitate drainage.

Offtake ditches are provided when there is not a sufficiently well defined water course to carry away the water discharged from any culvert. When the distance from summit to culvert is only 2 or 3 stations we find that the surface water can be satisfactorily disposed of by digging a ditch from culvert outlet to the edge of the right-of-way and discharging the water into the adjoining field—well tilled soil will absorb this quantity of water without damage and if the land is not cultivated, no objection is usually made to this method by the owner of the property. At every point where water is carried through a culvert under the roadway, we endeavor, if possible, to discharge this water from the right-of-way directly opposite the culvert.

Drifting Soil

We have a difficulty in connection with surface drainage which is unknown in other portions of Canada. That is, the almost annual obliteration of road ditches by drifting soil in prairie areas where the soil is heavy. We have severe wind storms during March and April which cause the clay soils pulverized by intensive cultivation, to drift like snow. In a great many cases, turnpiked roads are not only obliterated, but are rendered very difficult to rebuild, owing to the granular nature of the drifted soil which, by the way, is often mistaken for sand. This granular material is very difficult to handle with a blade grader, as it runs around or over the blade, and the clearing of the ditches is a real problem. When you have succeeded in removing the drifted material from the ditches to the crown of the road, you have also succeeded in rendering the road impassable, as this material cannot be consolidated except when wet.

Two years ago, a ditch approximately 1,000 ft. long and 2 to 3 ft. deep, was constructed to drain a slough which was situated on the right-of-way of one of our trunk roads. This ditch was completely filled by drifting soil the following Spring, but on account of the granular nature of the material, the ditch continued to be effective for one season, but ditches required to carry running water are immediately rendered useless when filled with this material. To maintain many of our roads we will have to build protection fences, similar to snow fences, to prevent the drifting soil from filling the ditches, unless the Agriculturists devise a system of crop rotation which will provide sufficient fibre in the soil to prevent this drifting action.

Culverts

Culverts form a part of a surface drainage system, and the following are the types of culverts installed on roads being improved by the Provincial Department of Highways:

- (1) Pipe Culverts, (a) Corrugated iron; (b) Concrete.
- (2) Box Culverts, (a) Concrete, (b) Timber

(3) Arch Culverts of Concrete.

On our trunk roads we do not use timber culverts, except in special circumstances. We believe that culverts of a permanent type should be used exclusively on main roads and we are able to adhere to this policy excepting where we find it necessary to provide large openings to carry off the spring floods.

Our river valleys are deep and vary in width from 1-4 mile to 4 miles. Very often the entire valley is flooded in the Spring, and we have to construct embankments of from 3 to 5 ft. in height across the flats tributary to the river. To protect these embankments against spring floods we have to provide culverts having 16 to 20 ft. clear spans at the several points where channels develop when the river is in flood. The cost of constructing 3 or 4 permanent culverts of these dimensions, possible in one mile of road, is almost prohibitive, in view of the amount of funds available, consequently under these circumstances we have to resort to pile bent culverts.

In connection with the use of pipe culverts, we find when these culverts are placed sufficiently low to remove all water from the side ditches, they are quite useless during the spring run off, unless the snow and ice has been removed from the culverts by a maintenance patrol. Alternative thawing and freezing during the month of March often fills the culverts with ice, which is very difficult to remove, and consequently we find it necessary to use box culverts with a considerable vertical opening at points where there are natural water courses. At smaller runways we often place a culvert at natural surface elevation to take care of spring run-off. When installing a pipe culvert as an even in an embankment constructed across a slough, we place the culvert on solid ground near the end of the embankment, at an elevation equal to the normal water level in the slough. The average cost of culverts varying from 12 in. to 36 in., diameter per mile of road is approximately \$400.

Sub-Drainage

As already mentioned we are unable to build hard-surfaced road in the rural parts of our province, consequently we do not provide under drainage on our roads except in so far as side ditches remove water from the roadbed if they have a proper gradient and an outlet, or provide a source of water to be carried through the sub-grade to the road surface by capillary action if water remains in the side ditches for any length of time.

We occasionally find it necessary to provide under drainage in a cut where the earth formation is such that water continues to seep out of the hill to the roadway, the method adopted being a rock filled ditch, but tile underdrainage on earth roads in our province, where the average cost per mile of roadway does not exceed \$2,000 is not to be considered. Even if the necessary funds were available, the writer questions the serviceability of a tile drain at a depth of 2 or 3 ft. in a heavy gumbo soil which will retain water in undrained side ditches for a period of 2 to 3 weeks until it disappears by the process of evaporation.

We adopt the principle of under-drainage by endeavoring as far as possible to keep our roads on the natural surface, and avoiding deep cuts. The surface soil is more porous and has a great many passages made by worms and insects, decaying roots, etc., consequently a road on surface soil has considerable sub-drainage already provided, also evaporation is much more effective on the surface than in a cut.

Our experience in connection with sub-drainage is so limited that the writer will not attempt to discuss the matter further, but we are fully aware of the fact that the fundamental basis of all road maintenance is drainage, and we are endeavoring in the face of unusual difficulties to provide proper and adequate ditches and culverts on our provincial highways system, so that with careful attention our earth roads, the only roads we can at present afford to build, shall render to the taxpayers of our province the maximum service of which they are capable.

IMPROVING EARTH, CLAY AND SAND ROADS*

Physical and Soil Conditions in Alberta—Methods of Grading Prairie Roads and Roads in Timbered Districts—Cost of Grading.

By J. D. Robertson,

Deputy Minister of Public Works, Alberta.

LOCAL conditions make it rather difficult to apply a uniform method of road construction to the Province of Alberta as a whole, running as it does into the foot hills and mountains on the west, timbered country with occasional swamps and muskegs to the north, and rolling and level prairie to the south and east. Soil conditions also vary a great deal. Generally speaking the soil is excellent for agricultural purposes, but the better it is in this respect the less desirable it is as a road building material.

In view of these facts you will no doubt appreciate our difficulty in preparing specifications for construction of roads applicable to the entire province. If, on the other hand, it was sufficiently developed to warrant hard surfaced construction we could ship the required material by rail if necessary and thus adopt uniform methods of construction.

For this reason we must follow the method of construction, which in our opinion is best adopted to local conditions and controlled by the amount of money available for the work. In stating how to improve sand, clay and earth roads, as I cannot outline in detail any particular method applicable to Alberta as a whole, I will choose our two extreme conditions, that is the method we adopt in open level prairie, and on the other hand the method followed in fairly heavy timbered country to the north end of the province.

Road Improvements Over Prairie

First let me deal with our method of road construction in level prairie country; all material for crown being obtained from the side ditches. We usually construct our more important main highways a width of 28 ft. between the outside of ditches. Others that are not required to carry as much traffic are very often constructed 26 ft. between ditches, and the local roads carrying still less traffic have a width of 24 ft. This provides a travelling surface of 20 ft., 18 ft. and 16 ft. respectively. Where any of the above mentioned roads carry excessively heavy traffic, as leading into a city or large business centre, the width may be increased by not more than 2 ft.

In constructing a main highway 28 ft. between outside of ditches two lines of pickets are set 28 ft. apart, equal distance from centre line of road allowance. When the tractor which provides the power required, is used for hauling heavy 12 ft. blade grader, plowing is not necessary. The first round trip is made down one line of pickets and back the other which constitutes one round or two running-miles for each mile road graded. In the first round the outside end of the grader blade is dropped well down and forward, which cuts very much as if it were a plow. In the second round the position of the blade is changed slightly so that on this trip the material is pushed to within one foot of the centre of the road. Generally speaking we now have all the sod that is to be moved in the centre of the road overlying the centre 18 ft. of 20 ft. of original prairie sod which has not been disturbed. The third round is a second plowing with the blade grader in the side ditches, this material being fairly free from sod. The fourth round again pushes this material to within about one foot of the centre of the road, covering the sod. The fifth round pushes the material to the centre of the road, but instead of the road being suitably crowned it usually comes to a peak in the centre, more in the shape of a roof. A further trip one way is

therefore necessary, which is carried out by setting the grader blade straight across the road and proceeding to the end of the new grade. Camp is usually moved at this time by hauling the cook car and other equipment behind the grader. The grader removing the ridge from the centre of the road and giving the road the necessary crown, and at the same time makes wheel marks in the centre of the new grade, which acts as a guide to traffic following. This last trip constitutes 1-2 a round making 5 1-2 miles all told, or 11 running-miles for each mile of road graded.

I might add here that we consider 5 1-2 miles the maximum required and very often a 1-2 is sufficient for a road 28 ft. between ditches, and is invariably sufficient for a road 26 ft. or less between ditches. Work of this nature should usually be done in the spring or early summer when there is sufficient moisture in the ground so that the grade will consolidate for it is absolutely useless if carried out after midsummer during a dry year, as there is nothing but a pile of dust through which it is impossible to travel.

The Government own all graders used for work of this nature, but do not own the tractors. We believe it is more economical to run the tractors on a mileage basis, paying \$9 to \$10 per running-mile for the use of the tractor, including cost of operation and repairs. The department usually pay the man who operates the grader, he being held responsible for bringing the grade to the proper cross section and keeping a record of the number of miles made by the tractor. This work would, generally speaking, average from \$90 to \$100 per mile and for this amount we obtain an 18 ft. to 20 ft. surface for traffic with a side ditch 15 in. to 18 in. deep.

Further work may be necessary to provide a road surface suitable for traffic, depending entirely on the nature of the soil. It may be necessary to use a disc or harrow to cut sod or break down lumps, and use a road drag to level the surface. In other sections of the country it may also be necessary to remove rocks from the grade. When such is the case they should be cast well outside the ditches.

With this method of road construction the grade line of the side ditches conforms to the contour of the ground surface and does not likely provide for carrying surface water to drainage outlets, but is liable to form pools in every depression. It is therefore necessary to bring the side ditches to a grade line that will prevent the water lying along the grade. It is also important that all necessary culverts be installed. They should be put in immediately after the grading is completed so that the fill over the culvert, will properly consolidate with the road bed.

The cost of such road including culverts and ditches over fairly level prairie would run approximately \$300 per mile, depending of course on the number of culverts required and the amount of drainage necessary. In passing I wish to draw your attention to this fact that the travelling surface provided is only of material taken from the side ditches, such as it is.

Through Timbered Country

I will now deal with our method of road construction in the timbered portion of the province, assuming that all material for grade is obtained from the side ditches and that the distance between outside of ditches is 28 ft. We first must locate our property line and usually stake out the central 33 ft. of the road, which is cleared and grubbed. In clearing various methods are followed, but I believe the one giving the most satisfactory results is that of cutting the trees off about 3 or 4 ft. up from the ground. This gives an opportunity with a block or team, depending on the size of the trees with hitch near the top of the cut off, to pull out the stump. If they are any size it is usually advisable to first shoot a stick of stumping powder under the stump which loosens the stump, but the principal benefit derived is that it jars the earth loose from the roots so that when the stump is pulled out, it comes out clean and without bringing a large quantity

*Paper read at ninth annual Convention of the Canadian Good Roads Association, Victoria, June 12-15, 1922.

of earth with it. All stumps, roots and other fibrous matter are cleared from the central 33 ft. of the road, which is absolutely necessary to permit the grader to do its work. The cost of clearing and grubbing is generally figured on an average basis, varying from \$10 to \$50 per acre, depending entirely on the class of timber to be cleared. In heavy spruce it might cost even more than \$50. However the timber is not generally heavy in Northern Alberta, being mostly light poplar. A fair average I believe for this kind of material would be \$25 per acre for clearing and grubbing the central 33 ft., which means an expenditure of \$100 per mile with an extra \$15 an acre for clearing only, the balance of the road allowance, being an expenditure of \$160 per mile for clearing the entire width of road allowance and grubbing the central 33 ft. This is only an average, as we have had instances where this work would cost up to \$1,000 per mile. The brush, roots, etc., are piled and burned. We next grade the road with an 8 ft. horse grader, hauled by at least 4 teams. It is usually necessary to first plow two or three furrows on each side of the road. The material is then pushed in with the blade grader after the same manner as is done in prairie grading, except that the same progress cannot be made, more trips are usually necessary owing to the small roots encountered. It is invariably necessary to disc the road well after grading and again trim it up with a grader to obtain the necessary crown, which would likely cost \$125 per mile. Further work to improve such a road and open it for traffic would depend entirely on the nature of the country.

The clearing, grubbing and grading I have referred to, will only answer where the ground is high and dry and naturally well drained. Usually however besides drainage and installing culverts there is considerable other work to do such as laying corduroy or brush and making cuts or fills.

Brush and Corduroy Roads

In connection with corduroying, the material is cut 16 ft. in length and laid side by side across centre of road. Where the material can be obtained within 1-2 a mile the cost is about \$2.50 per rod, which is at the rate of \$800 per mile. This is only used in passing over muskeg or low land that will not support an earth fill. A willow brush mat of the same width, laid 12 to 15 in. deep can be done for about the same price. Willow brush is laid with tops overlapping in the centre of road. The brush tops from one side of the road are carried throughout as a lower layer and the tops from the other side forming an upper layer so that when the brush is being covered the teams can then swing with brush tops. This is a very important feature in laying brush and the proper laying of the brush greatly reduces the cost of filling. Brush and corduroy is usually only necessary for a short stretch and therefore only represents a small percentage of the total mileage being worked. I might state that generally in fairly heavy timbered country it would cost about \$150 per mile for brushing or corduroying. We then have installing culverts and making fills, and most important of all ditching, as drainage is the all important feature especially constructing roads in a timbered country. The main feature we always keep before our men is to get the water off. The cost of improvements of this nature would run from \$600 to \$1,000 per mile in timbered country such as exists in Northern Alberta, which invariably includes stretches of low land required to be brushed and corduroyed. We, therefore, might easily strike our average \$800 per mile.

I first dealt with road improvement for prairie country and arrived at an estimated cost of \$300 per mile. Through timbered country \$800 per mile. The balance of the province will vary between these two amounts depending on the nature of the country through which the road passes. In either case what have we got? Principally a road constructed of material taken from the side ditches, such as it is, which presents a travelling surface that if properly dragged throughout the season is a very

fair road to travel upon during dry weather. But during the wet weather there will be many sections of road that would not carry traffic without injury to the road and danger to those attempting to travel. When the soil obtained from the side ditches is of sand, fine gravel or a sand clay mixture a very fair travelling surface is provided even during wet weather. On the other hand where the soil is exceptionally light it is quite satisfactory in wet weather, but is not at all suitable in dry weather. Again where gumbo or heavy black loam is encountered one usually endangers their life by trying to drive a motor vehicle over it after a rain, and after a period of wet weather the traffic will ruin for the time being, this portion of the road.

Mileage Graded

We have in Alberta approximately 15,800 miles of continuous graded roads and 28,500 miles approximately of road where the necessary culverts have been installed, fills made where necessary, but not continuously graded throughout as the drier sections carry traffic without further improvement. We have approximately 12,500 miles of regular road allowance which can be travelled and upon which no improvements have been made, with an additional 3,000 miles of angling trail temporarily used in lieu of regular roads not yet opened. We therefore have approximately 60,000 miles of graded road or trail in use at the present time with another 80,000 miles of regular road allowance in the fairly well settled portions of the province, which have not yet been opened for traffic, which serves approximately 100,000 resident ratepayers outside of the cities, towns, villages or hamlets. Of the 15,000 miles of continuous graded roads, a very small percentage, possibly not over 300 miles all told, have been surfaced with material other than that taken from the side ditches or where fills have been made the material borrowed from the adjoining knolls.

In Alberta gravel is scarce, while there are isolated deposits of gravel they are so scattered that the cost of haulage practically prohibits their use at our present state of development. I feel, however, that our solution is the mixture of sand and clay, as in the sections of our roads where we encountered a sand clay mixture in the proper proportion, a fairly good all weather road is provided.

In conclusion I wish to state that we have about 3,000 miles of main highway, which carries fairly heavy motor traffic from early spring until late autumn, together with an equal mileage of main market roads, which are not standing up under the traffic which they must accommodate. It is apparent that for these roads at least we must provide a more suitable wearing surface than that obtained from use of material from side ditches.

An old prairie trail is all that could be desired for very light traffic, but as soon as traffic increases beyond its carrying capacity it is absolutely useless. The same applies to our roads built from the side ditches regardless of quality of material used. Our problem in Alberta at the present time is to devise ways and means of further improving the wearing surface of our earth roads with the material available for the purpose, such as gravel or sand clay, always keeping before us the vast mileage to be improved and the extent to which Alberta is developed at the present time.

Announcement is made by Mussen, Ltd., that they are now agents for the entire Dominion for the Western Wheeled Scraper Company's line of earth-handling and grading machinery, and that stock of a large part of this line is now being carried in Toronto as well as in Montreal. This is the first time, state Mussen, Ltd., that this line has been available in Ontario for immediate delivery to grading and highway contractors and municipalities.

The cost of the Welland Ship Canal when completed is estimated at \$55,000,000. The original estimate of the cost of the canal was \$50,000,000. Up to date the expenditure has been \$30,000,000.

ECONOMICAL METHODS OF HANDLING MATERIALS*

More General Use of Machinery in Road Construction—
Reduces Handling Costs and Expedites Work—Con-
tractor Should not Have too Much Equipment.

By Lt.-Col. H. L. Bowlby,

President, American Road Builders Association.

WHEN it is understood that the cost of handling, on the job, the materials that enter into the hard surfaced road runs from ten to fifteen per cent. of the total cost of the pavement, the great importance of doing this work economically is obvious.

Road building today is in a machine-made era. The successful contractor is the one who provides himself with equipment suited for economically handling his materials, taking into consideration, of course, local conditions and the available supplies of such materials.

The equipment required depends, first, upon the character of the improvement, whether it is an earth road, gravel road, water-bound macadam, bituminous macadam, asphaltic concrete, bitulithic plain or reinforced Portland cement concrete or brick road. Given the character of road to be built, the selection of a proper plant depends upon the size of the job and local conditions.

The common materials to be moved and handled are: earth, sand, gravel, crushed stone, cement, water, hydrated lime, steel reinforcement, asphalt, brick and stone screenings.

Use Machinery Now

The principal new departure in the moving of earth excavation has been the recent development of the use of caterpillar tractors with very large road scrapers and the use of mechanical subgrade planes for trimming up the sub-grade to the established grade line immediately ahead of the laying of the pavement.

Sand, gravel, broken stone and stone screenings are handled today by the large contractors with machinery. Mechanical loaders are used for filling motor trucks or railroad cars. Locomotive cranes, mounted on caterpillar treads, are much used for handling these materials by means of clamshell buckets. In some instances locomotive cranes, mounted on standard or narrow gauge railroad trucks, are used, especially in the large central material yards. When the sand, gravel, broken stone and cement are transported from a central material yard to the mixing gang on the road, small cranes are used to transfer the large batch boxes from the motor trucks or industrial railway to the concrete mixers.

Practice in those states that are doing the greatest amount of concrete road building, seems to be standardizing on the use of narrow gauge railway equipment for hauling the mineral aggregates to the mixers on the road. The trains consist of gasoline or steam locomotives pulling flat cars which carry a number of batch boxes, each containing a full batch for the mixer. The track is laid along the shoulder of the road. Turnouts and switches are provided as needed and moved at night so as not to interfere with the next day's work. Some contractors are hauling the batch boxes of aggregates with motor trucks from the material yard to the mixer. It is constantly becoming more popular, however, to permit the mineral aggregates to be piled on the subgrade and have the mixing gang work through them.

Water is supplied to the mixer and for curing the concrete pavement by means of a pipe line laid alongside of the road. This practice is almost universal.

In some states the wet mixed concrete is being hauled from a central mixing plant to the road in much the same manner that the "hot stuff" is hauled out from a central asphalt mixing plant to an asphalt pavement un-

der construction. The hauling of this wet mixture is done mostly with dump trucks of various kinds.

The mineral aggregates in a central material yard are handled nearly altogether by machinery. A locomotive crane with clamshell bucket usually unloads the sand, gravel or stone from the cars or scows to large storage piles. From these piles the materials are transferred to appropriately arranged bunkers by means of cranes and clamshell buckets. The batch boxes, whether to be moved to the job by motor-trucks or by industrial railway, are filled with the proper proportions of fine and coarse aggregates from the bunkers. Many ingenious measuring devices are used at the bunker gates for proportioning the sand, gravel or stone as the batch boxes are filled.

In the construction of bituminous roads, the mineral aggregates are handled in much the same manner as above described for concrete roads. The chief difference is that the bituminous-concrete or "hot stuff" is always mixed at a central mixing plant and then hauled to the road, dumped, immediately spread and rolled.

The asphalt is usually transported to the central mixing plant in barrels or metal drums, although in some instances it is brought to the plant in tank cars or tank motor trucks. The handling of the bituminous material from the barrels or tanks to the mixer is universally accomplished by means of large melting kettles and small pumps which lift the hot asphalt to the measuring bucket immediately over the mixer.

When motor trucks are used to transport the mineral aggregates to the pavement laying gang, it is usually necessary to provide mechanical means for turning the trucks around on a comparatively narrow roadway. There are on the market a number of turn-tables which accomplish this purpose satisfactorily.

There is a great tendency today among contractors to over-equip, to purchase too much plant for the job. The wise contractor has available just enough machinery and equipment. When he is over supplied with equipment he loses money in several ways. Among these are excessive overhead and depreciation, and a general slowing up of the work due to too many "tools" on the job. The wise contractor also hires the best superintendent of construction available, knowing that a hundred dollars extra per month on this expense means many thousands of dollars saved on handling costs.

The greater part of the hauling of road materials since the end of the World War has been done in the United States with motor trucks. This practice has been adopted in all of the states. One of the principal reasons for suddenly changing from horses and wagons to motor-propelled vehicles has been the free distribution by the Government to the State Highway Departments of surplus motor trucks. During the past three years there have been thus distributed approximately 30,000 motor trucks of various capacities. The further distribution of several thousand caterpillar tractors of 5 and 10-ton capacity, has given an impetus to the more economical handling of earth excavation. But few communities that have made a trial of moving materials by motor trucks and tractors will go back to the old method of using horses and wagons.

At the second annual meeting of the Northern Electric Engineering Society held at Montreal, the following officers were elected: Hon. President, P. F. Sise; President, W. S. Vipond; Vice-President, N. R. Ashley; Secretary, A. J. Lawrence; Treasurer, L. R. Waller. Committee, F. J. Benoy, W. B. Cartmel, J. Shields, J. O. Beaudet, F. H. Adler.

The Spanish River Pulp & Paper Co. has engaged an aeroplane to make an aerial survey of 1,000 square miles of forest north and west of Michipicoten. The aeroplane will be piloted by Captain Walter E. Lees, who will take with him on the trip Ben Avery and J. F. Regan of the Forestry Department and Milton S. Beal, photographer and executive officer.

EXPERIMENTS IN IMPROVING AND MAINTAINING OUR PRAIRIE ROADS*

Bituminous Deposits Awaiting Development — Characteristics of Prairie Soils — Experiments With Bitumen and Soils at Alberta University

By Dr. K. A. Clark,

Industrial Research Department, University of Alberta.

TWO closely related Alberta problems are being investigated at the Industrial Research Dept. of the University of Alberta, under the administration of the Scientific and Industrial Research Council of Alberta, Hon. Herbert Greenfield, chairman; namely, methods of improving our prairie roads and methods of development of the Athabasca bituminous sands. It is not obvious, at first sight, that these problems are related, yet, it seems probable that it is to the deposit of Athabasca bituminous sands that the prairie provinces should look to find the supply material that will act as a substitute for the stone and gravel materials used in the making of the well-known hard surfaced roads which are missing in the prairies. The bituminous sands contain an asphalt which, when separated from the associated sand and then mixed with prairie soil, quite profoundly changes the nature of the soil and makes it resistant to the unstabilizing action of water. Natural prairie soils, if at all clayey, take up water with avidity and promptly turn into a sticky, unstable mud that is the despair of both the traveller and the highway engineer.

Prairie Road Problem

The relationship between the prairie road problem and the bituminous sands is interesting. The prairie road problem is well-known; a tremendous mileage of highways; mud of the worst kind; generally speaking, no supplies of stone or gravel with which to make road surfaces; and not a large enough population or volume of traffic to warrant importation of materials to build the well-known hard surfaced roads at any cost. In connection with this road situation consider the other problem. In the north of the Province of Alberta there are about 15,000 square miles of country underlain by sand impregnated by asphalt. Large quantities of this bituminous sand are in plain sight along the banks of the rivers which have cut their valleys through the formation. This bituminous sand deposit is the largest of its sort so far found anywhere in the world. It is one of the big resources of Alberta. Two obstacles stand in the way of its development: first, the lack of an economical method of separating the asphalt from the sand so that the 85 per cent. of sand may be left in the north and only the 15 per cent. of the bitumen be shipped out; secondly, the lack of a sufficiently extensive use for the asphalt, when separated, to make feasible the establishment of development operations. The Industrial Research Department of the University of Alberta is searching diligently for a method of separation and if present favorable indications continue favorable, it will find one. It is in regard to the second obstacle that the connection between roads and bituminous sands arises. The big use for asphalt today is in road construction. Our prairie provinces need roads. If it can be discovered that by the use of reasonably small amounts of bituminous-sand asphalt, a type of prairie road adequate to the needs of the rural communities can be built economically, then a big outlet for asphalt from a bituminous sand will be open. The solution of the prairie road problem and of the tar sand problem are tied up together.

Colloid Content of Soil

The development of a type of prairie road with the aid of bituminous-sand asphalt will depend on an understanding of the properties of prairie soils. The outstanding property of prairie soils, from the road point of view, is

their mud-forming ability in presence of water. What is the reason of this mud-forming ability? Studies by soil chemists and physicists have assigned the reason to the colloid content of the soils. The term "colloid" need not introduce any mystery into the discussion. Everyday experience brings us all into contact with colloids. Two common examples are gelatine and glue. These substances are hard, and stable and when dry have marked binding qualities but when placed in water they swell to unstable jellies. In many places throughout Alberta, Nature has concentrated a natural colloid which, if it is not the actual colloid present in our prairie soils, must be very similar to it. I refer to "bentonite." Bentonite is a hard, almost stone-like material when dry, but in contact with water it swells to about eight times its dry volume into a sticky, unstable mass. Granted that bentonite or a similar type of substance is present in our prairie soils, it is not so hard to understand their hard, stable nature when dry and their marvelously quick change to unstable mud when they become wet. It is the presence of such a constituent in prairie soils which makes it so difficult to get a satisfactory sand-clay mixture for prairie roads. Many prairie soils are natural sand-clay mixtures, yet they soften badly when wet. The key to the situation is to find some way of modifying the soil colloid so that it will not swell in the presence of water, some way of keeping it always in its stable form.

Properties of Adsorption

There is a property of colloids which offers hope of accomplishing the result of modifying the soil colloid so that it will not so readily swell in water, the property of "adsorption." The term "adsorption" is probably still more mysterious than that of "colloid." There is no mystery about it however. Adsorption is a property which all matter, in the liquid and the solid form at least, possesses of condensing and tenaciously holding onto its surface a very thin layer of other substances with which the surfaces come into contact. Everybody has observed the working of this property. Why does a canvas tent shed rain? Because the dry canvas has a layer of air adsorbed onto the surfaces of all its fibres and the rain must first displace this adsorbed air before it can penetrate the canvas. Why does a shower penetrate such a little way into dry sand? Because the dry sand particles have a layer of air adsorbed onto their surfaces and this air must be displaced before the sand particles can be made wet by the rain. Colloids are made up of exceedingly small particles. The result is that a small amount of colloid has a tremendous amount of surface. Since adsorption is an effect that takes place on surfaces, adsorption is a very prominent property of colloids. If a fine soil such as a clayey soil is shaken up with a dye solution and this mixture placed on a filter, the solution which filters through is colorless. The soil particles, especially the very fine, colloid particles, have adsorbed the dye which was dissolved in the water and have left the water colorless. There are a host of substances that soil particles will adsorb in a similar manner to the way they adsorb the dye. If the soil particles could be brought into contact with some suitable substance, a substance, an adsorbed layer of which on the surface of the soil particles would prevent them from taking up water, then a remedy for the mud-forming propensity of soils would be in sight.

Experiments with Bitumen

Bitumen such as asphalt is a substance which repels water. Bitumen at once suggests itself as a substance to try to get adsorbed onto soil particles. Experiments tend to show that bitumen is adsorbed by the soil particles and that this adsorbed bituminous layer prevents the soil colloid from swelling in water. When the rather soft asphalt which is separated from the Athabasca bituminous sands is mixed with a wet soil, the asphalt readily works through the soil and is apparently distributed over the surfaces of the particles. When the wet soil into which the bitumen has been mixed dries out again, it is found that it has

*Paper read at the ninth annual convention Canadian Good Roads Association, Victoria, B.C., June 12-15, 1922

largely lost its ability to again take up water, at least at all readily. The quantity of bitumen that it is necessary to mix with the soil to accomplish this result varies, of course, with the clayey nature of the soil. Experiments at the University of Alberta have been made on a series of soils including a sandy soil from the south of the province, silty soils, a natural sand-clay mix and heavy clay soils. The method of test is very simple. A sample of the soil is made sufficiently wet with water so that it can be easily worked. The desired amount of asphalt, as separated from the bituminous sands, is added and worked through the wet soil. The sample is then compacted into a small wooden box and the top rounded off to imitate a miniature section of road and set away to dry. It is then exposed to wet conditions which are created by the spray from a garden hose. Samples are placed under the spray at the close of the afternoon and the result observed the following morning. By arranging a series of samples of the same soil containing varying percentages of bitumen, the advantage gained over the natural soil by addition of the bitumen, and the quantity of bitumen which must be added to render the soil stable against the artificial rain, are at once apparent. It is found that 5 per cent. by weight of the bituminous sand asphalt is sufficient for the sandy soils, from 5 per cent. to 10 per cent. for the silty soils while for the heavy clay soils 15 per cent to 20 per cent. is required. The bitumen for a heavy clay soil appears to be excessive. However, in a practical application, the proper procedure would be to make a sand-clay mix and incorporate into the sand-clay aggregate 5 per cent. of the bituminous-sand asphalt. The sand for admixture would not need to be a coarse sand, as is required for ordinary sand-clay construction, for the bitumen-treated clay will be stable under wet conditions as well as under dry conditions. If this scheme proves to be of practical value, the prairie road type may become, not the sand-clay type, but a modification of this type, a sand-clay-bitumen road.

The idea of using bitumen in a soil mixture especially in the way that has been described may seem novel to many but in reality it is not new. Oiling earth roads has been quite extensively practiced and has met varied success. A type of pavement called the "Bituminized Earth Pavement" was proposed a few years ago in the United States. It was made by incorporating about 17 per cent. of asphalt into dry, pulverized clay soil. The Bureau of Roads Progress Report for 1916 gives an account of an experimental piece of road construction very similar indeed to what we have been discussing. Hot asphalt was mixed into wet clay. The results were rather encouraging but the idea was not carried to a definite conclusion. Bitumen is also being used by the Bureau of Roads in experiments to stabilize subgrades for pavements. We do not claim and great share of originality for the work being carried on at the University of Alberta on the road problem. It is simply a case of trying to apply what has already been found out and what little else we can ourselves find out to local conditions which we have to face in our prairie provinces. Nature has not provided up with the material to build the well-known types of hard surfaced roads and we cannot afford to import these materials. Yet we need something better than the plain dirt roads, when the weather turns wet. If most prairie roads could be made to stay as stable when wet as they are when dry, our roads would be plenty good enough for our needs for some years to come. If we can get the asphalt out of the Athabasca deposit of bituminous sand cheaply, I believe that through its use it will be possible for the prairie provinces to make economical roads that will be serviceable whether it rains or shines.

The fifteenth general annual assembly of the Royal Architectural Institute of Canada will be held at Winnipeg, Man., on Monday and Tuesday, September 25 and 26, 1922. David R. Brown, Architect of Montreal is president and Alcide Chausse, Architect of Montreal is honorary secretary. Every practicing architect in Canada will receive an invitation to attend this important convention.

RATING AND TESTING ELECTRICAL MACHINERY

SUB-COMMITTEE of the Canadian Engineering Standards Association held its first meeting at Ottawa on June 16, with Prof. E. G. Burr in the chair. The chairman pointed out that the sub-committee had been formed to consider the advisability of the adoption or formulation of the C.E.S.A. of Canadian standardization rules for electrical machinery, covering the same ground as and preferably based upon, the rules of the American Institute of Electrical Engineers.

As a result of preliminary correspondence, it appeared that practically all the members of the sub-committee were in favor of the adoption of the A.I.E.E. rules, subject to such amendments or changes in arrangement as may be found desirable. This decision was confirmed by the meeting.

Discussion followed as to the best organization for the work, and three panels were appointed to deal respectively with the rules for rating and testing of:

- (1) Large motors, generators, and rotating machinery operating under controllable conditions;
- (2) Industrial sizes of motors and generators working under ordinary manufacturing or operating conditions,
- (3) Transformers of various types.

The existing transformer sub-committee would, of course, be consulted as regards the work of panel No. 3.

Consideration was given to the best method of keeping the sub-committee in touch with American committees working along the same lines, and it was decided that the fullest possible co-operation should be arranged for through the American Engineering Standards Committee.

QUEBEC ROAD POLICIES

SPEAKING at the Canadian Good Roads Association Convention recently, Hon. J. L. Perron, the new president of the Association, outlined the road policies of Quebec since 1912. He declared that the road program inaugurated in 1912 was now practically completed and that by next August there would not be a mile of road in the province that was not in first-class condition.

Quebec's policy in respect to municipal roads was to lend funds to municipalities at three per cent on a forty-one year basis, or pay 50 per cent. of the cost. Quebec spent \$1,000,000 on roads in 1912, before automobiles were a traffic factor, and during the war years the road appropriations were conservative, but in 1920 they advanced to \$5,000,000, and by the end of the present fiscal year about \$8,500,000 would probably be spent, he said.

We make our appropriations on the ratio of three dollars on the roads to serve rural communities to one dollar on provincial roads seeing tourists and pleasure seekers mainly, said Mr. Perron. We have carefully preserved that ratio and we find that not only are the farm districts well served, but we are able to carry out successfully, important highway projects for tourists as well. For instance, we put through a road to the White Mountains, another one to Maine, another to connect Montreal and Quebec, and so on. Tourist highway advocates are becoming more ambitious every year, and I hope to live to see the Canadian Highway complete from coast to coast.

Mr. Perron said he was a great believer in hard surface roads, but he warned that governments must not overburden the people with taxes. The liquor law of Quebec, he pointed out, attracted between 25,000 and 30,000 tourists over the roads to Quebec annually. The government realized that it was only fair to allocate a substantial proportion of the liquor profits towards road maintenance, and that recognition had been incorporated in the province's roads policy. The destruction of roads caused by the traffic of heavy motor trucks had resulted in the passage of a law prohibiting cars of more than two and a half tons from using the highways. Many of the highways were closed during the thawing season, he said, as a further precaution against wear and tear at a period when severe damage could be done.

THE GOOD ROADS CONVENTION

SUCCESS crowned the efforts of the executive responsible for the program of the ninth annual convention of the Canadian Good Roads Association at Victoria, the report of which appears in this week's issue of "Canadian Engineer." In spite of the long distances that many delegates had to travel, the attendance was most satisfactory. Many excellent papers were read and the discussion brought out many interesting and helpful points. The fact that so many prominent men, engineers and public officials, gathered together for the definite purpose of discussing road problems, indicates that the success of the good roads movement is assured. As a result of this gathering more practical interest will be taken in highway construction, which must assist materially in the commercial development of Canada.

While conventions have certain advantages socially, one of the principal benefits comes from the interchange of ideas and the dissemination of knowledge. The good roads movement has received a decided impetus and each year will doubtless see an increasingly active interest taken in what has already become a national movement.

Millions of dollars will be expended on the construction and maintenance of roads in Canada during the next few years and it is very desirable that this money be spent to the best advantage. The first step is to educate public opinion to the necessity of good roads, so that money can be secured for this purpose. Conventions are most useful in this respect because of the publicity given the good roads movement. Roads must be built as economically as possible, consistent with good work, and those connected with

their construction and maintenance can derive much benefit from the papers and discussions at the conventions. The Hon. S. J. Latta, the retiring president of the association, in an able address, (printed elsewhere in this issue) brought out several interesting points regarding the construction, location and financing of highways. He referred to the many factors to be considered in road construction and emphasized the advantage of co-operation in solving road problems.

GUNITE ENCASEMENT OF STEEL BRIDGE STRUCTURES

THERE is now being built across the Willamette River at Oregon City, Oregon, a 360-ft. steel arch span which will undoubtedly attract the attention of very many bridge engineers. On account of the presence in the immediate vicinity of large industrial plants employing sulphurous anhydride, which has a pronounced deteriorating effect upon exposed steel, it was necessary to employ a protective coating for the steel of greater resistance than ordinary paint. After exhaustive study of many alternative types of structure, it was finally decided to construct the ribs of structural steel and to encase them with a thin coating of gunite. This is to be applied both on the exterior of the rib and on the interior. According to Engineering News-Record, the inside section is to be covered with a 3-4 in. gunite encasement and the exterior with wire mesh and an encasement of 1 1-2 in. of gunite finished with a carpet float.

With the increasing use of gunite for the protection of steel bridge structures, the engineering profession would welcome data concerning the resistance of these thin protective coverings of gunite to surface cracking. The efficacy of such a protective covering will entirely depend upon the ability of the gunite to preserve an unbroken surface. It is to be hoped that those engineers who have employed this material successfully will make known their methods by which they have combated the tendency of a thin mortar coating to crack at certain critical points.

LIMITATIONS TO WEIGHT OF RAILWAY EQUIPMENT

ALONG with the amazing increase in the weight of railway locomotives and cars, there has developed increasing criticism of the practice of carrying the weight of equipment to the present advanced state. For especially heavy traffic, locomotives of 400 tons weight are being employed, as for example, the Virginian 2-10-10-2 weighing 342 tons, and the Erie class P1-8-S-S-2 weighing 432 tons. While there is no doubt a saving in wages involved with the use of these immense locomotives, per thousand pounds of tractive effort, it should not be forgotten that the roadway maintenance resulting from their use and the cost of repairs to freight cars increase rapidly with the weight of the locomotive. When, with the use of powerful locomotives, the length of trains is increased beyond a certain point there is a tendency for the trains to break, for loads to shift and for damage to cars to become burdensome. Increased delays are also charged against very heavy locomotives, in one instance it being found that the time delayed due to car failures was twice as great with Mikado engine having a tractive effort of 57,000 lb. as with a Consolidation locomotive with a tractive effort of 39,000 lb.

Doubts are also expressed concerning the wisdom of building modern passenger and freight cars of enormous weights and carrying capacity. There are now in use coal cars of 120 tons capacity, and Pullman cars 90 ft. in length weighing approximately as many tons. The weight involved in the construction of a 90-ft. bridge structure as is found in the Pullman car is great as compared with that which would exist with a much shorter car. Some engineers express the view that with modern 100-lb. steel rails and with a track having 18 in. of stone ballast, the riding properties of much lighter cars would be satisfactory. There is the extra danger of destruction of cars in a

train through the presence in it of excessively heavy rolling stock. In addition, it is pointed out that the upkeep of tracks and bridges through very heavy cars is a charge that might be appreciably lessened without decreasing the popularity of a road by the use of lighter equipment.

PERSONALS

RUSSELL T. KELLEY, of Hamilton, was elected first vice-president of the Canadian Good Roads Association at the Victoria convention.

WALTER MAXWELL FINE of Edmonton, recently secured degree of Master of Science from the Massachusetts Institute of Technology.

F. L. FELLOWS, of Vancouver, was elected second vice-president of the Canadian Good Roads Association at the convention held in Victoria recently.

HON. JOSEPH LEONIDE PERRON, Minister of the Department of Highways for Quebec, was elected president of the Canadian Good Roads Association in the convention recently held in Victoria.

THOMAS MCMILLAN, vice-president of the Canadian Fairbanks-Morse Co., will succeed president HENRY J. FULLER, who resigned to become chairman of the Board of Directors. Mr. McMillan who is a native of Toronto, joined the Canadian Fairbanks-Morse Co. when 16 years old. His first important assignment with this company was that of credit manager of the Fairbanks-Morse Co. at St. Paul, Minn. In 1905, Mr. McMillan transferred to the headquarters of the Canadian Fairbanks-Morse Co., of Montreal, where he was appointed secretary of the company; subsequently being advanced to the directorate and to the position of vice-president.

OBITUARY

WALTER F. MERCER, contractor, died on June 15, aged 58. Deceased was born in Ayrshire, Scotland, and came to Canada when a boy, settling in Toronto, where he had lived ever since.

MANUFACTURE OF PORTLAND CEMENT

Reviewed by A. C. Tagge

Assistant General Manager, Canada Cement Co., Ltd.

MANUFACTURE OF PORTLAND CEMENT—By Arthur C. Davis, third edition, revised and enlarged, with 100 illustrations. Dublin, John Falconer. Flexible imitation leather; 6 by 9 in., pp. 416.

This is a third edition of an earlier work which the publisher announces has "been re-written and brought up to date by the insertion of matter dealing with the latest available information concerning the manufacture and testing of Portland cement, including a description of the newest labor-saving devices and testing appliances and methods, and the latest theoretical conclusions as to its constitution."

A more suitable title would be "Portland Cement" instead of "Manufacture of Portland Cement," as more than half of the book is devoted to chemical and physical testing specifications and uses.

The chapters on manufacturing deal almost entirely with materials, processes and equipment as used in the United Kingdom, and the Canadian reader will miss much that is common to modern mills on this side of the Atlantic. He will, moreover, find it hard to believe that this part of the book is representative of modern practice in the United Kingdom and this difficulty will be increased when he finds the rotary kiln referred to as "a new departure

in burning operations" and "a comparatively new method of cement manufacture."

Furthermore, some of the statements are misleading and some are incorrect in so far as manufacturing in this country is concerned. This part of the book would seem to have been brought up to date by the insertion of new material without the elimination of that which has become obsolete. For the reader who is familiar with modern practice, there is much that is interesting and suggestive, but for one who wishes to get a general idea of the manufacture as now carried on in this country, the book will be found disappointing.

The chapters on chemical analysis and on testing are excellent and contain many valuable observations on the effects of the various constituents and the relative importance of the different standard tests.

The chapter on "Sampling, Testing and Uses" contains a brief but interesting discussion on aggregates, proportioning, mixing and placing of concrete.

Other chapters that will be favorably noted are "Mineralogy of Cement," treating of the microscopic and crystalline structure; "Mechanism of Setting," presenting the crystalline and colloid theories; and "Fuel Valuation," giving methods of chemical analysis and calorimetric tests.

The appendix gives British, French and American standard specifications for Portland cement. There is an unusually full index.

AIR RECEIVERS AND AIR COOLERS. Bulletin K-310, recently issued by the Canadian Ingersoll-Rand Co., illustrating and describing air receivers of the vertical and horizontal types, and air coolers also of the vertical and horizontal types. The pamphlet will be found of considerable interest to all those who are engaged in any class of work in which compressed air is used.

ANNUAL REPORT OF THE TOPOGRAPHICAL SURVEY BRANCH FOR 1920-21. The report contains a record of the work done by this Branch according to the various locations. There are several appendices, one showing schedules for each surveyor employed, with the cost of work done by him. Appendix No. 4 gives the details of office work, while Appendix No. 5 shows the surveying instruments on hand on March, 21, 1921. Accompanying the report is a map designed to illustrate the progress of Dominion lands surveys. The report contains 56 pages.

STEAM TURBINES. A line of velocity-stage turbines especially designed for high pressure and high temperature steam is described in a 28-page catalog, 8 1/2 by 11 in., issued by the De Laval Steam Turbine Co., Trenton, N.J. The cast steel steam chest is located in the casing cover in order to avoid the conduction of heat to the bearings. In addition to the speed governor and governor valve, there is an independent valve controlled by an automatic over-speed trip. The turbines are built in sizes up to 1,200 h.p., and are designed to be directly coupled to high speed centrifugal pumps and blowers, small a.c. and d.c. generators, and, by means of double helical speed-reducing gears, to large pumps and blowers, medium-size generators, belt pulleys, rope sheaves and slow moderate speed machinery.

Contract for the St. John's, Winnipeg, telephone exchange of 6,600 lines has been secured by Siemens Brothers and Co., Ltd., Woolwich, London, Eng. Work was commenced in the factory at Woolwich immediately the contract was signed and early delivery is expected. This is, as far as is known, the first large installation of automatic telephone exchange equipment in Canada secured by a British firm and it is expected to be the forerunner of a permanent connection in this country. In addition to the above, Siemens Brothers and Co., Ltd. are constructing equipment for two or three small telephone exchanges in other parts of Western Canada. The Winnipeg order was secured for the British firm as the result of the initiative and work of the British Government Trade Commissioner resident in that city.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand or proposed, contracts awarded, changes in staffs, etc.

BRIDGES, ROADS AND STREETS

Bathurst, N.E.—Word has been received by Town Clerk Strout from General Manager Kingsland, of the C.N.R. that it has been decided to recommend building of proposed concrete and steel overhead bridge where the spur line of railway intersects Murray St.

Belleville, Ont.—Hastings County Council approved of an expenditure this year on roads of \$125,700.

Birch Cliff, Ont.—Contracts for construction of sidewalks in Scarborough Township were awarded as follows: Danforth Ave., W. B. Hughes, 43 Victoria Park Ave., \$8,-031.66; Kingston Road, Kildonan Drive, Eastwood Ave., Birch Cliff Ave. and Audrey Ave., Grant Contracting Co., \$10,088; Pinegrove Ave. and Park St., A. Johnson, Fairmount Crescent, \$2,241. Other bidders on this work were: I. Scott & Son, 206 Silver Birch Ave.; National Contracting Co., Garniock Ave.; D. McKey, Ashdale Ave.; P. Licrasto, Toronto; A. Cavotti, Toronto; Maple Leaf Paving Co., Simcoe, Ont.; Britnell Contracting Co., Toronto; Goldie Construction Co., Toronto; Frank Angotti, Toronto; J. E. Jones, Toronto; F. Mattannia, Fergus, Ont.

Brantford, Ont.—Board of Works will probably recommend to City Council that a new road be built on Ava Road to city limits. City Engineer, F. P. Adams.

Bridgeburg, Ont.—The International Bridge Promotion Committee at Bridgeburg, of which Mayor W. T. Malkin is a prominent member, has decided to start activities immediately to bring about an actual start on the enlargement of the international bridge here.

British Columbia, Province of.—Contracts awarded by Highways Department to E. J. Palmer & Co. for paving two miles of the Yale Road in Langley Municipality. Concrete will be laid at a cost of about \$50,000.

British Columbia, Province of.—Provincial Public Works Department will shortly call for tenders for reconstruction of two sections of trans-provincial highway east of Creston. Estimated cost, \$30,000.

British Columbia, Province of.—A petition to the Government to have the money provided to carry out changes in the 25 miles of road from Princeton to Hope so that it will be suitable for a highway linking the coast and the interior of the province, is being signed by motorists in every community and will be presented to the Lieutenant-Governor for action.

Chatham, Ont.—City Council will petition the Ontario Government to construct 3 1-2 miles of the Provincial Highway east of Chatham during the present year.

Chatham, Ont.—City Council intends to construct asphalt pavement on St. Clair St., Cornhill St., William and Water Sts. at a cost of \$28,990.30; also granolithic sidewalks on King St., William St., Gladstone Ave. and Sheldon Ave. at cost of \$1,674.22. City Clerk, W. G. Merritt.

Drummondville, Que.—Contracts for structural steel in connection with construction of bridges at Bagot, Que., and Riviere Rouge, Valleyfield, Que., were recently obtained by the Walsh Plate and Structural Works, Ltd.

Dundas, Ont.—Work will start at once on repairs to streets and construction of concrete sidewalks. Town Engineer Murdoch will superintend the work.

East Nisouri Tp.—Contract for abutments for bridges at Lot 35, Townline between East Nisouri and West Zorra Townships, was awarded to A. Clifford, of St. Mary's, for \$1,185.

Edmonds, B.C.—The sum of \$15,000 is available from the Provincial Department of Public Works for work on

the Hastings-Barnet road this summer, providing Burnaby agrees to spend \$5,000 on the same highway.

Etobicoke Tp., Ont.—Contract for construction of concrete sidewalks on Douglas Ave. and Queen St. and grading on Queen St. awarded to A. Johnson at \$2,350.

Goderich, Ont.—Huron County Council granted town of Goderich \$26,000 for road construction on Victoria St. The estimates for county roads this year total \$173,800. Road Superintendent, T. R. Patterson, Goderich.

Halifax, N.S.—Works Committee recommended to City Council the laying of a concrete sidewalk on the east side of Brunswick St., from Buckingham to Duke.

Hamilton, Ont.—Wentworth St. is to be paved and car tracks relaid.

Hamilton, Ont.—City Council awarded contract for asphalt to the Warner Quinlan Co., at \$22.75 per ton.

Hamilton, Ont.—Hamilton & Wentworth Suburban Highways Commission awarded contract for laying 7,500 sq. yds. of 7-in. concrete roadway with crushed stone shoulders to the King Engineering & Construction Co., of Oakville, at \$25,383. Tenders were also received from the Frid Construction Co., the Canadian Engineering & Contracting Co. and Brayley & Patterson.

Hensall, Ont.—Tenders will be received until Wednesday, June 28, for the construction of 9,920 square yards of reinforced concrete pavement on King St. Plans and specifications may be seen at the office of T. R. Patterson, Engineer, Goderich, or A. Murdock, village clerk, Hensall, Ont.

Ladner, B.C.—Delta Council decided to widen Scott Road to 24 ft. and to construct concrete culverts across it. The road will be finished in hard surface some time during the next year. Clerk, N. A. McDiarmid.

Leaside, Ont.—York Tp. Council granted \$4,000 to the Town Council to expend on Bayview Ave., from Moore Ave. to Eglinton Ave.

London, Ont.—Hamilton Road, Dundas St. and Wharncliffe Road North will probably be paved this year. City Engineer, H. A. Brazier.

London, Ont.—City Council intends to construct a concrete walk on Rogers Ave. North, from Wharncliffe Road to Wilson Ave. City Clerk., S. Baker.

Markham, Ont.—Council awarded contract for concrete curb and gutter along Main St. to Willmot Shell, at 60c a ft. or total of \$4,560.

Mimico, Ont.—E. Huffman's tender for \$36,596 has been accepted for construction of pavement on a number of roads.

Montreal, Que.—Executive Committee asked City Council for \$10,762 for widening of Drolet St.

Montreal, Que.—City Council plans to pave 1,000 ft. on Craig St., between Bleury St. and Victoria Sq., with either granite blocks or asphalt.

Montreal, Que.—Instructions have been issued by the Executive Committee for the preparation of plans for reconstruction of Wellington St. subway, passing under G.T.R. tracks in Point St. Charles. City is also repaving Wellington St. this summer.

Montreal, Que.—Tenders will be received until June 26, addressed to the Executive Committee, for the construction of the following works: Paving—Des Erables St., from Amity to Sherbrooke Sts. Sidewalks—North side, Monkland St., from Melrose St. to Grand Blvd.; west side, Des Carrières St., from Laurier to Lamorichiere Sts. Pav-

ing and sidewalks—St. Donat St., from Sherbrooke St. to Lot 396-875. Paving—Monkland St., from Walkley to Montclair Sts., with sidewalk on south side of said street. Specifications may be obtained at office of the Road Branch Department of Public Works, City Hall.

Murrayville, B.C.—Langley Council voted a number of additional appropriations for road repairs. Clerk, R. A. Payne.

Nassagaweya Tp., Ont.—Contract for construction of bridge was awarded by Township Council to Butler & Palmer, of Guelph, at \$1,125.

Nelson, B. C.—De Wolf & Ham, contractors for construction of Ymir Road, awarded sub-contracts for grading to following: W. Olynk and G. Maglio, A. Larsen and G. Johnson, B. Blakeman, K. Mason and G. Anokski; Frank Nelson; H. Carver and L. Larsen; Thomas Tedford and Frank Brady; Oscar Nelson; L. Lindwell; W. Caroda; and A. Schulli.

Niagara Falls, Ont.—The Queen Victoria Park Commission has set aside \$100,000 for the completion of the Niagara Falls-Queenston boulevard.

Niagara Falls, Ont.—City Council intends to construct concrete walks on Lewis St., Ontario St., Liberty St., Spring St., Willmott St. and Third St. Clerk, W. J. Seymour.

Ontario, Province of.—The construction of a county-provincial road from the 6th Concession, Eldon, and the 3rd quarter road of Eldon to Fenelon Tp., is projected by the Councils of Ontario and Victoria Counties and the Provincial Highway Department.

Oshawa, Ont.—Ontario County Council passed by-law to raise \$20,000 for county roads and bridges.

Oshawa, Ont.—Town Council plans to extend Mechanic St. Engineer, W. C. Smith.

Oshawa, Ont.—Town Council accepted tender of Flint-off & Saunders for concrete sidewalks at 21 cents per sq. ft. and for crossings 24 cents per sq. ft.

Oshawa, Ont.—City Council intends to construct asphaltic concrete pavements on Albert St., Avenue St., Aberdeen St., Connaught St., Masson St. and Ritson Road, at a total cost of \$90,432.12. Clerk, F. E. Hare.

Oshawa, Ont.—Town Council awarded contract for asphalt concrete pavements to the Standard Paving Co., of Ottawa, at the unit price of \$3.36 per sq. yd. with an aggregate total of \$90,000. Other tenders were as follows: The Central Foundation Co. of Toronto, who bid on asphalt concrete pavements at \$3.44 per sq. yd., and also concrete pavements, at \$2.35 per sq. yd.; and John Carroll, of Peterborough, concrete pavements, \$2.35 per sq. yd.

Ottawa, Ont.—Road and bridge committee of Carleton County Council awarded contracts to Alex. Christie & Sons for erection of superstructure of North Gower bridge at \$1,648, and superstructure of Porteous bridge at \$3,456.50.

Owen Sound, Ont.—Work on Provincial Highway south of this city awarded to Frank Milligan & Co., of Iroquois, Ont.

Patricia, Alta.—Municipalities of Patricia and Iron Creek have already contracted with the Western Engineer and Construction Co., of Edmonton, for the building of 50 miles of road this year. In all probability there will be at least 100 miles built in these municipalities this year.

Pembroke, Ont.—Town Council intends to construct an asphaltic concrete pavement on Pembroke St. East, at an estimated cost of \$6,038.90. Clerk-Treasurer, S. L. Biggs.

Pembroke, Ont.—Town Council intends to construct bituminous macadam roadways on Hincks St., Trafalgar Road and Isabella St., at a total estimated cost of \$47,049.

Pembroke, Ont.—Town Council passed by-laws authorizing the construction of walk on west side of Centre St., from Metcalfe St. to Irving St., and for the grading and gravelling of the roadway on Doran St. Clerk, S. L. Briggs.

Port Stanley, Ont.—The assistance of the Dominion Government will be sought by Elgin County Council in repairing the west abutment of the Port Stanley bridge and in making the proper provision for erection of a lift bridge some time in the future. County Engineer James A. Bell,

St. Thomas, was instructed to prepare plans and specifications for the bridge repair and to advertise for tenders.

Quebec, Province of.—Contract for construction of Levis-St. Lambert highway (part in District No. 2) awarded to La Compagnie de Construction de St.-Ours.

Quebec, Province of.—Tenders for the construction of the Vaudreuil section of the Parrot Island bridge are to be called before the end of the month. Minister of Roads, Hon. J. L. Perron.

Quebec, Province of.—Tenders will be received by Hon. J. L. Perron, Minister of Roads, until one o'clock p.m., Friday, July 7, for the construction of a gravelled roadway on Chemin du Bord de l'Eau, Parish of St. Michel of Bellechasse.

Quebec, Province of.—Tenders will be received at the office of the Minister of Roads, Government Building, Quebec, Que., until one o'clock p.m., Tuesday, July 11, for construction of a gravelled roadway on portion of Joliette-l'Assomption situated in the parish of l'Assomption. Length, 11,687 feet.

Saskatchewan, Province of.—Lt.-Col. A. J. McPherson has been sent out by the Department of Highways to investigate the economic feasibility of a large drainage scheme in the Carrot River country in the northeast of the province. Estimated cost, \$324,960.

Saskatchewan, Province of.—Thousands of acres will be reclaimed in Saskatchewan this season when the several drainage schemes under the Department of Highways are carried out. The work which is being undertaken in various parts of the province will cost the provincial government about \$50,000.

Thessalon, Ont.—Tenders addressed to John Coulter, Town Clerk of Thessalon, will be received up to July 8, 1922, for the supply of and erection of (a) 200 h.p. water turbine with governor directly connected to a 175-k.v.a. generator, complete with switchboard and exciter, etc.; (b) construction of dam, head works, 48-in. wood stave pipe line, power house and tail race. Plans and specifications may be seen at the office of the consulting engineer or of the town clerk, Thessalon. Set of plans and specifications may be obtained from the engineer upon deposit of \$10. John O. Coulter, Clerk and James, Proctor & Redfern, Toronto, Engineers. (See official adv.).

Toronto, Ont.—York County Council decided to relay flooring of Don Valley bridge and also lay a tile drain on Pape Ave., from Aldridge Ave. to Cronin Ave.

Vancouver, B.C.—Two projects involving the expenditure of over \$1,300,000, have been commenced by the B.C. Electric Railway Co., one being the construction of a new 640-ft. dam and the rebuilding of the present dam at Stave Lake, permitting the addition of a fourth power unit, to cost \$1,250,000, and the other being the extension of the Broadway West line, in the city, to cost some \$75,000.

West Luther, Tp., Ont.—Contract for construction of municipal drain containing 20,300 cu. yds. awarded to Archibald Construction Co., Ltd., Toronto, at 26 cents per cu. yd. Other tenders received: Robert Longe, 34 cents; Segaworth & Dobbs, Damascus, 28½ cents; Chas. Van Slambrouck, Blenheim, \$6,000; Wilbert Drury, R. R. No. 2, Arthur, 30 cents; Laurie Gaunt, Arthur, 39 cents; McDonnell Bros., 12 Pandora Ave., Kitchener, 39½ cents.

Winnipeg, Man.—A provincial charter has been granted to the Winnipeg Clay Products, Ltd., capitalized at \$500,000. Director, Alex. Morrison.

York Tp., Ont.—Township Council approved some 56 local improvement by-laws.

ROADS, BRIDGES AND STREETS

(Additional)

Barton Tp., Ont.—New tenders are being received for building of roads and laying of sidewalks. Tenders close June 30. Clerk, A. G. E. Bryant, Court House, Hamilton.

Brantford, Ont.—Road and bridge committee of Brant County Council is considering construction of bridge on county road west of Burford. County Engineer, A. M. Jackson, Brantford.

East Gwillimbury Tp., Ont.—Contract awarded to Hector Patterson, Gormley, Ont., for construction of concrete bridge.

Etobicoke Tp., Ont.—Contracts were awarded to G. S. Wright for construction of two reinforced concrete culverts.

Ford City, Ont.—Town Council intends to widen Strabane Ave., from Erskine St. to Sandwich St., to a width of 70 ft., at a cost of \$4,125. Clerk, J. F. Foster.

Hamilton, Ont.—Board of Control recommended to City Council that contract for cement mixer be awarded to Koehring Co. of Canada, Toronto, at \$6,525. Other tenders received: Dominion Industrial Products Co., \$5,360.37; St. Clair Concrete Machinery Co., Galt, \$2,635; Whettlauffer Bros., Toronto, \$5,300; London Concrete Machinery Co., \$5,000; F. H. Hopkins Co., \$7,487; Mussels, Ltd., \$8,466; E. J. McHaig Co., \$8,350.

London, Ont.—City Engineer H. A. Brazier announced that one mile of paved streets will be constructed this year in west London at a cost of \$45,000.

Mlniota, Man.—Contract for placing of concrete pipes and building headwalls in roads constructed during 1922, awarded to D. C. McDougall, Virden, Man. Other bidders were: T. W. Manser, Virden; F. W. Bridger, Brandon; W. H. Hannan, Virden.

Owen Sound, Ont.—Contract for approximately 1,500 sq. yds. of concrete pavement awarded to Mackenzie & Symonds, Wiarton, at \$1.86. Other tenders received: Dewar Bros., Owen Sound, \$2.49; Clark & Son, Owen

Sound, \$2.51; and Bryson & Irwin, Wiarton, \$2.60.

Pembroke, Ont.—Town Council adopted report of Board of Works recommending construction of granolithic walks on Christie St., Nelson. St and Peter St., at cost of \$2,502. Town Clerk, S. L. Briggs.

Pembroke, Ont.—Town Council passed by-laws authorizing the widening of McAllister St. at cost of \$4,075; construction of bituminous macadam roadways on Hineks St.; and granolithic walk on Metcalfe St., \$1,131.

Pembroke, Ont.—Contract for asphaltic concrete construction of pavement awarded to the Warren Bituminous Paving Co. of Ontario, Ltd., at \$94,766.50. Other tenders received: Godson Contracting Co., Ltd., \$83,604; Grand Bros. Construction Co., Ltd., \$87,746.

St. John, N.B.—Plans and an estimate of cost for paving of north and south sides of Haymarket Square and Market Square have been completed.

Shipton Tp., Que.—Tenders will be received until noon, Saturday, July 1, for construction of bridge. Plans and specifications may be obtained on application to the Department of Public Works and Labor, Quebec, Que.

Winnipeg, Man.—City Council intends to construct granolithic walks on a number of streets. City Clerk, C. J. Brown.

Winnipeg, Man.—Contract for removal of westerly half of swing span of old Provencher Bridge was awarded to F. E. Buckham, 299 Beverley St., Winnipeg, at \$925.

Woodstock, Ont.—Following contracts were awarded in connection with construction of North Oxford Bridge: Concrete abutments, Frank Fogarty, Ingersoll, \$1,615; grading, George Wilkes, of Woodstock, \$1,500; steel work, Stratford Bridge & Iron Co., at \$3,250.

York Tp., Ont.—Tenders will be received by Frank Barber, Township Engineer, Toronto, until 12 o'clock noon, Saturday, July 8, for construction of concrete sidewalks. (See official adv.)

York Tp., Ont.—Following contracts awarded for construction of concrete sidewalks: Brumell Ave., \$750, Methuen Ave., \$2,500; Bude St., \$1,200, Dunvegan Road,

MISCELLANEOUS (Additional)

Barton Tp., Ont.—Tenders will be received until 6 p.m., Thursday, July 6, by James Atherton, Secretary, Board of Trustees, School Section Barton Tp., 200 East 23rd St., Hamilton, for erection of four-room school on Wellington St.; an eight or ten-room addition to Wentworth Street School; and a two-room addition to Brantdale Ave. School. Plans and specifications may be seen at office of J. A. Arnes, Architect, 67 Charles St., Hamilton.

Burlington, Ont.—Tenders were received until June 24 for several trades in connection with addition to school at Burlington Beach. Architects, McPhie & Kelly, Bank of Hamilton Building, Hamilton.

Buzwa, Ont.—Tenders addressed to Duncan C. Scott, Deputy Superintendent General of Indian Affairs, Dept. of Indian Affairs, Ottawa, will be received until noon, July 3, for combined day school and teachers' residence. Plans and specifications may be seen at the Post Office, Owen Sound; office of the Indian Agents, Gore Bay and Manitowaning; and at the Department at Ottawa.

Cambridge, N.S.—The villages of Cambridge and Waterville have completed the incorporation of a company to be known as the Cambridge-Waterville Hydro-Electric Power Co., Ltd., with a capital stock of \$20,000. President, J. G. Webster, Cambridge.

Dartmouth, N.S.—Tenders addressed to E. H. Armstrong, Minister of Public Works and Mines, for addition to store building, Nova Scotia Hospital, will be received until 12 o'clock noon, July 6. Plans and specifications may be seen at Mines Office, Halifax, and at office of Medical Superintendent, Nova Scotia Hospital, Dartmouth.

Essondale, B.C.—Tenders will be received by the Hon. the Minister of Public Works until 12 o'clock noon, Monday, July 3, for installation of heating and ventilation system for new Acute Building at the Mental Hospital, Essondale. Plans and specifications may be seen at office of the Government Agent, Court House, Vancouver; Government Agent, Court House, New Westminster; or Department of Public Works, Victoria, B.C.

Gross Isle, Que.—Tenders addressed to R. C. Desrochers, Secretary, Department of Public Works, Ottawa, will be received until 12 o'clock noon, Thursday, July 6, for construction of an extension to the eastern wharf. Plans and specifications may be obtained at Department of Public Works, Ottawa; at offices of District Engineers, Post Office Building, Quebec; Shaughnessy Building, Montreal; and at Post Office, Montmagny, Que.

High River, Alta.—Work will start shortly on construction of 2½-mile diversion canal from Highwood River to Little Bow River. Address, D. O. McKay, Little Bow Irrigation District, Lechbridge.

Inglewood, Ont.—Separate or bulk tenders addressed to T. H. Graham, Secretary, Board of Education, will be received until 5 o'clock p.m., Tuesday, July 1, for erection of three-roomed public school building. Plans and specifications may be obtained at office of the architects, Smith & Wright, Dominion Bank Chambers, 2945 Dundas St. West, Toronto.

Kenora, Ont.—Board of Education awarded contract to McKay & Davidson, of Winnipeg, for erection of four-room school building, for \$20,915. Other tenders received: Bergman & Nilson, \$25,400; Claydon Co., Ltd., Winnipeg,

\$23,400; Kelly & Robb, \$21,900; Lindstrom & Nilson, \$25,500.

London, Ont.—Tenders will soon be called by the authorities of Western University for the construction of a new science building and also a new main building. John M. Moore & Co., 489 Richmond St. W., London, Ont., are the architects in charge of the work. R. E. W. Hagarty, Temple Bldg., Toronto, is the consulting engineer.

London, Ont.—Contract has been awarded by the authorities of Western University to John Putherbough, 1006 Wellington St., London, for a three-span structural steel cantilever bridge, with concrete piers and with steelwork encased in 6 in. of concrete, to be built across the Thames River. The cost will be approximately \$110,000. The sub-contract for structural steel has been awarded to McGregor & McIntyre, Ltd., Toronto. John M. Moore & Co., 489 Richmond St. W., London, Ont., are the architects in charge of the work. R. E. W. Hagarty, Temple Bridge, Toronto, is the consulting engineer. Work will be started immediately.

New Liskeard, Ont.—Tenders addressed to W. H. Maund, Sec.-Treas., Temiskaming and Northern Ontario Railway Commission, North Bay, will be received until 12 o'clock noon, Friday, July 7, for erection of a brick freight shed. Plans and specifications may be seen at office of S. B. Clement, Chief Engineer, North Bay, and at office of E. M. Goodman, Agent, New Liskeard.

Ottawa, Ont.—Tenders addressed to Henry R. Washington, Clerk, Carlton County, will be received until June 30 for plumbing and heating required in addition to County Court House. Plans and specifications may be obtained at office of Architect, C. J. Burritt, Hope Chambers, Ottawa.

TENDERS PENDING

The following tabulation is presented as a reminder to contractors in regard to tenders that are still pending, other than those reported in this issue. The word "Issue" refers to the issue of "Canadian Engineer" in which there appeared a notice giving details regarding the call for tenders.

Place of Work	Tenders Close	Issue
Bridgeburg, Ont., erection of municipal building	Jul. 3	Jun. 20
Calgary, Alta., supply of cable	Jul. 6	Jun. 20
Calgary, Alta., supply of one motor-driven combination pumping engine and hose car	Jun. 30	Jun. 13
Cochrane, Ont., erection of school	Jun. 30	Jun. 20
East Missouri Tp., Ont., construction of bridge	Jun. 29	Jun. 13
Eganville, Ont., granolithic walks	Jul. 1	Jun. 20
Hensall, Ont., construction of pavement	Jun. 28	Jun. 20
Kentville, N.S., erection of church	Jul. 3	Jun. 20
Kincardine, Ont., dredging	Jun. 28	Jun. 20
Kinloss Tp., Ont., construction of drain	Jun. 29	Jun. 20
Lakeside, Ont., completion of drain	Jun. 29	Jun. 13
Nassau, New Providence, Bahamas, dredging	July 15	May 9
Ontario, Province of, work on Provincial Highways	July 7	Jun. 13
Port Burwell, Ont., repairs to breakwater	Jun. 28	Jun. 13
Port Colborne, Ont., repairs to breakwater	Jul. 4	Jun. 20
Port Hope, Ont., electric wiring and fittings for public building	Jun. 29	Jun. 20
Sombra Tp., Ont., completion of pavement	Jun. 28	Jun. 20
Toronto, Ont., erection of Nurses' Home	Jul. 4	Jun. 20
Toronto, Ont., supply and installation of sewage pump and motor	Jul. 18	Jun. 20
Welland, Ont., installation of steam heating system	Jun. 30	Jun. 20
West Nisouri Tp., Ont., construction of drain	Jul. 3	Jun. 20
York Tp., Ont., pavements and grading	Jul. 3	Jun. 20

The Contractor's First Choice Always

The Waterous double cylinder steam roller has been the first choice of contractors for over twenty-five years. That the confidence placed in the Waterous roller by the contractors of Canada is fully upheld is evidenced by the fact that when in need of additional rollers they insist on Waterous. This is because the Waterous roller is designed and built to earn money for its owner. Every detail of its engineering, every inch of the tested material in it, contributes directly and always to this one end.

Some years ago Wentworth County kept accurate costs of a Waterous roller and one of another make. The result showed that the Waterous roller worked in one year 202 days of 10 hours each and 76 nights of 12 hours each. The cost of repairs was \$189.00 which was practically the total cost of repairs incurred since it was bought, and it has been in service five years.

The other make of roller was in operation 129 days of 10 hours each, and 18 nights of 12 hours each and cost \$197.00 for repairs, being in operation four seasons.

The above figures show that the Waterous roller not only did 250 per cent more work but did it at a maintenance cost of 23 percent less.

Waterous

BRANTFORD, ONTARIO, CANADA

Ottawa, Ont.—Bulk tenders addressed to Henry R. Washington, Carleton County Clerk, will be received until June 30 for addition to County House. Plans and specifications may be obtained at office of architect, C. J. Burritt, Hope Chambers, Ottawa.

Ottawa, Ont.—Bulk or separate tenders will be received by the Public School Board until noon, Thursday, June 29, for several works required for erection of an Administration Building corner of Gilmour and O'Connor Sts. Plans and specifications may be seen at the office of W. C. Beattie, Superintendent of Buildings, Elgin Street School Building.

Port Dover, Ont.—E. A. James, Engineer, Toronto, submitted plans for a water works and for a sewerage system to the Town Council. By-law will be submitted to ratepayers.

Port Hope, Ont.—Tenders addressed to R. C. Desrochers, Secretary, Department of Public Works, will be received until 12 o'clock noon, Thursday, June 29, for electric wiring and fittings in the public building, Port Hope.

Quebec, Que.—Provincial Department of Public Works awarded following contracts for construction of extension to Quebec Court House: Roofing, Eugene Falardeau; woodwork, Morrisette, Ltd.; masonry, E. Frenette; granite, Jobin & Genois; lime, Deschambault Quarry. Contracts aggregate \$263,000.

Riverside, Ont.—Council passed by-laws authorizing Town Engineer R. W. Code to prepare plans for a water main and sidewalks on both sides of Lauzon Road, from Riverside drive to the Hydro tracks; a water main and sidewalk on the east side of Jarvis St., from Riverside drive to Lot No. 42.

Riverside, Ont.—Following contracts were awarded for Riverside School for Roman Catholic Separate School Board, School Section 2: General contract, Cleveland Mousseau, Ford City, \$28,174; plumbing and heating, Windsor Plumbing & Heating Co., Windsor, \$5,375; electric wiring, E. H. Mailloux, Riverside, \$314.

St. John, N.B.—Tenders will be received by A. Gordon Leavitt, Secretary, School Trustees, until 12 o'clock noon, June 30, for erection of brick and concrete school building on Duke St., West End. Plans and specifications may be seen at office of Architect, F. Neil Brodie, 42 Princess St., St. John.

St. Thomas, Ont.—Tenders will be received until 12 o'clock, Tuesday, July 4, by Darrach & Findlay, architects, 430 Talbot St., St. Thomas, for several trades required in erection of a swimming pool and gymnasium for Alma Ladies' College.

Tierford, Ont.—Bosanquet Township Council provisionally adopted the report of Engineer George A. McCubbin, of Chatham, on big Canadian Company drain. Estimated cost, \$59,000. Work will be commenced this summer.

Toronto, Ont.—Tenders addressed to the Superintendent of the Merrill Corporation, No. 3 Earl St., will be received until 5 p.m., July 6, for the erection of apartment hotel at No. 3 Earl St.

Toronto, Ont.—Contracts for laying and jointing of 6-in. water pipes awarded as follows: Burgess Ave., Cedarville Ave., Heath St. E., Old Orchard Grove, Rusholme Road, to Grant Contracting Co., Ltd., at total of \$2,083.

Toronto, Ont.—Tenders will be received, addressed to the Chairman, Board of Control, City Hall, until 12 o'clock noon, Tuesday, July 4, for one Iron Planer. Specifications may be obtained at Room 12, City Hall.

Toronto, Ont.—Tenders addressed to C. A. Maguire (Mayor), chairman, Board of Control, will be received until noon, Tuesday, July 11, for laying and jointing of 6-in. water pipes in Brookside Drive, Cranbrooke Ave., Hillhurst Blvd., Nelles Ave. and Rosewell Ave. Specifications may be obtained on application at Room No. 320, City Hall.

Toronto, Ont.—Tenders addressed to C. A. Maguire (Mayor), chairman, Board of Control, will be received until Tuesday, July 11, for supply and installation of weigh scales on west side of Keele St., south of Dundas St. Specifications may be obtained at office of Property Department, City Hall.

Toronto, Ont.—Tenders addressed to W. W. Pearce, Business Administrator and Secretary-Treasurer, Board of Education, will be received until Monday, July 3, for (1) Masonry, structural steel, ornamental iron, steel sash, carpentry, roofing, tin-smithing, plastering, painting, glazing, terrazzo and marble work, plumbing, heating, ventilating, heat regulation, electric wiring, local phones, for Kitchener School; (2) masonry, structural steel, ornamental iron, steel sash, carpentry, roofing and tin-smithing, plastering, painting and glazing, plumbing, heating and ventilating, electric wiring, for Malvern Collegiate; (3) fibre mastic floors for Dufferin School; (4) roofing and tin-smithing for Annette St. School; and (5) carpentry for Fern Ave. School. Specifications may be seen at office of the Architect of the Board, 155 College St.

Welland, Ont.—Zero-Zone, Ltd., has been incorporated with capital stock of \$500,000. Plant will be constructed at corner of Burglatt and Victoria Sts. President, Byron A. Baseue.

Condensed Advs.

Advertisements (not displayed) under this heading at following rates per insertion, with sixty-five cents per insertion as minimum rate in any case: "Positions Wanted," two cents per word; all other condensed advertisements, four cents per word. Payable in advance; 50 per cent. extra if charged.

POSITION WANTED: Graduate civil engineer, with four years' experience on surveys and municipal work, wishes to apprentice with an Ontario Land Surveyor. Box 58, Canadian Engineer, Toronto.

CAST IRON PIPE. Eight 12-ft. lengths, 48-in. Class A, Bell and Spigot, new, shipping point near Montreal. Box 55, Canadian Engineer, Toronto.

STRUCTURAL DRAFTSMEN—Wanted immediately, several experienced steel draftsmen. Give experience and state salary. Chief Engineer, Standard Steel Construction Company, Welland, Ont. —348.

CIVIL AND MECHANICAL ENGINEER with extensive experience in Engineering, Contracting, Purchasing and Finance open for engagement with Consulting Engineer, Contractor or Manufacturer. Box 56, Canadian Engineer, Toronto.

POSITION VACANT: Structural designer in steel and reinforced concrete. Must be able to take initiative. State fully, training and experience. Address Box 57, Canadian Engineer, Toronto.

GENERAL ENGINEERING AGENCY, PITTSBURGH, PA. Serving Employers everywhere overnight, require for proposals Structural Engineers, Architects, Designers, Hydro-Electric Power field and office executives and assistants, Reinforced Concrete Draftsmen, Electrical Draftsmen, Mechanical Draftsmen. —323.

PATENT NOTICE: Any one desiring to obtain the invention covered by Canadian Patent No. 200078, granted on May 11, 1920, to the Ivers-Lee Company, of Newark, New Jersey, United States of America, for Package and Method of Making the same, may do so upon application to the undersigned, who are prepared to supply all reasonable demands on the part of the public for the invention and from whom full information may be obtained. Fetherstonhaugh & Co., 15 Elgin Street, Ottawa, Canada, Russell S. Smart, resident. —364

GURLEY

Water Stage Registers

ENGINEERS engaged in water power development, water supply, irrigation and reclamation projects recognize the need for accurate data covering the height and volume of water in streams from which reliable determinations can be made—

They further recognize the insufficiency of occasional observations and therefore the desirability of having hourly and daily records automatically made and recorded.

They have learned by experience that Gurley Water Stage Registers,—Graphic, Printing and Long Distance, unfailingly indicate and record the vital statistics upon which the Engineer can reliably base his calculations at all seasons.

A sympathetic understanding of requirements, reinforced by the "know-how" of precision instrument making, has placed the Gurley Organization in the lead in the estimation of a majority of Engineers.

We have special literature to offer to those who wish to inform themselves of the very latest progress.

This Is Your Service— Use It!

FREE BOOKLETS ON THE USES OF CONCRETE ARE YOURS FOR THE ASKING

The Portland Cement Association offers you its service, without charge, on how and why to use Concrete.

Our free booklets contain complete, reliable instructions, in every-day language, on every common use of Concrete.

Some of these booklets are:

*Recommended Practice for
Portland Cement Stucco*

*Concrete Basements and
Foundations*

*Concrete Building Block
and Brick*

Concrete Block Garages

*Concrete Swimming and
Wading Pools*

Concrete Schoolhouses

These are only a few. If none of these covers the job you have in mind, probably we have one that does. Write us about your work and we'll try to help you.

There are no strings on this service. It's free, and you are under no obligation in accepting it.

Dated at Winnipeg, this 5th day of June, 1922.

S. C. OXTON,
Deputy Minister of Public Works and
Chairman Fair Wage Board.—359

Tenders Called For

TOWN OF THESSALON, ONTARIO

HYDRO ELECTRIC POWER DEVELOPMENT

Sealed tenders marked and addressed to Mr. John Coulter, Town Clerk of Thessalon, will be received up to July 8, 1922, for the supply of materials, erection and construction of the following works:

Contract A

200-H.P. Water Turbine with governor, etc., directly connected to a 175-K.V.A. generator, complete with switchboard, exciter, etc., and erected in the Power House.

Contract B

Construction of dam, head works, 48-in., Wood Stave pipe line, power house and tail race.

Plans and specifications may be seen at the office of the Consulting Engineers or at the office of the Town Clerk at Thessalon and a set of plans and specifications may be obtained from the Engineers for the use of the contractor upon deposit of \$10.00, which will be returned when the said plans are returned.

The lowest or any tender not necessarily accepted.

W. A. BRIDGE, ESQ.,

Mayor.

JOHN O. COULTER, ESQ.,

Clerk.—362

JAMES, PROCTOR & REDFERN, LIMITED,
Consulting Engineers,
36 Toronto Street, Toronto.

TOWNSHIP OF YORK

Tenders, Pavements and Grading

Sealed Tenders, plainly marked as to contents, will be received by the undersigned up to 12 o'clock July 3rd, 1922, for the construction of Bituminous Macadam Pavements on Dunvegan Road and Forest Hill Road, also as Asphalt Pavement on Normanna Avenue and the grading of Bicknell Avenue.

Plans and specifications may be seen at the office of the undersigned, 40 Jarvis Street, Toronto.

The lowest or any tender will not necessarily be accepted.

FRANK BARBER,

Township Engineer.

Frank Barber and Associates Limited,
Consulting Engineers,

40 Jarvis Street, Toronto. —362
Toronto, June 19th, 1922.

TOWNSHIP OF YORK

TENDERS FOR CONCRETE SIDEWALKS

Sealed Tenders, plainly marked as to contents, will be received by the undersigned up to 12 o'clock Noon of Saturday, July 8, 1922, for the construction of concrete sidewalks on Alameda Avenue, Avon Avenue, Brunswick Avenue, Dentonia Park Avenue, Eastdale Avenue, Humewood Drive, Gordon Avenue, Keene Steert, Kendal Avenue, Lumsden Avenue, Meagher Avenue, Mould Avenue, Orla Avenue, Pritchard Avenue, Runnymede Road, Strathearn Blvd., and Walnut Avenue.

Plans and specifications may be seen at the office of the undersigned, 40 Jarvis Street, Toronto.

The lowest or any tender will not necessarily be accepted.

FRANK BARBER,

Township Engineer.

FRANK BARBER AND ASSOCIATES LIMITED,

Consulting Engineers,

40 Jarvis Street, Toronto.—365
Toronto, June 26, 1922.

TOWNSHIP OF ETOBICOKE

TENDERS FOR WATERWORKS, Area No. 3.

Sealed tenders, plainly marked as to contents and addressed to the undersigned, will be received up to ten o'clock a.m., Monday, July 3, 1922, for the following works:

- (1) Supplying 8-in. and 6-in. cast iron pipe.
- (2) Supplying special castings.
- (3) Supplying Valves and Hydrants.
- (4) Supplying Meter Pumps, etc.
- (5) Laying about 5,850 ft. of 8-in. main.
- (6) Laying about 5,850 ft. of 8-in. main.
- (7) Laying about 7,700 ft. of 6-in. main.
- (8) Building Pump House.

Plans and specifications may be seen and tender forms obtained from the office of the Township Engineer.

FRANK BARBER,

Township Engineer.

FRANK BARBER AND ASSOCIATES, LTD.,

Consulting Engineers,
40 Jarvis Street, Toronto.

Naturally, there are a good many local conditions that affect the choice of a pump, but there must be some reason why so many engineers insist that no matter what the type of centrifugal used—it must bear the name of The American Well Works.

Fifty years' experience in the manufacture of all types of centrifugal pumps assures their satisfactory operation.

HYDRAULIC TURBINES

Type Z Runner for Montreal Station, 114

Send for our Bulletin No. 54

WM. HAMILTON CO. LTD.
PETERBORO, - ONT.

BUILT TO ONE STANDARD—THE BEST

Lea-Courtenay 11 series "GLN" pump of the single-stage, double-suction type. Unit illustrated is furnished with labyrinth rings, diameter of suction and discharge being 14". Capacity, 6,500 gallons per minute against a 200-foot head, without diffusion rings.

The Lea-Courtenay Company has but one standard—the highest grade of materials and workmanship to be found in centrifugal pump construction.

From foundry to shipping rooms, accurate records are kept of each pump—pump parts undergoing a most careful and rigid inspection to insure perfect interchangeability of parts.

The Lea-Courtenay elaborately-equipped testing plant proves before delivery what the pump will do in service. When you install a Lea-Courtenay centrifugal pump, you get a KNOWN pumping performance—not an uncertainty or probability.

Write for a copy of Bulletin H-4 which fully describes the testing of Lea-Courtenay centrifugal pumps. It also gives data on types and installations.

Improved Anderson Oil Engines

Illustrating 120, 180, and 225 H.P. Type K.

ARE you watching your power cost?

ARE you drawing a line between economy and extravagance?

ARE you sure of a fair profit at the end of the year? ARE you investigating the ANDERSON OIL ENGINE? IF NOT—WHY NOT?

The problem of fuel, labor, and maintenance cost in plants seem insolvable—and in many cases will remain insolvable—until steps are taken to eliminate unnecessary waste by installing the ANDERSON OIL ENGINE.

Quick shipment on all sizes from 15 to 225 H.P.

Write for our literature—The latest on oil engines.

PUMPING MACHINERY

The advice of our skilled engineering staff is always available to meet your pumping problems.

We stand behind our product with a guarantee that means maximum protection to our customers.

The Smart-Turner Machine Co., Limited

Hamilton,

Canada

The steam trap with only one moving part

You can replace bucket or float non-return traps with the Sarco. When you do, you will eliminate trouble with joints, floats, levers, toggles, etc. The Sarco Trap has but one moving part, operated hydraulically and absolutely reliable. You save in first cost, in repairs and in worry when you specify "Sarco."
